Let  $B$  be the angle between  $AC$  and  $AO$  when there is no rotation and assume  $ADE$  to be a straight line which will be approximately true, since any tension of the spring in this position should act through a small moment arm about the point  $A$ . As the device rotates, the weight swings outward about the point  $A$ , and the points  $C$  and  $D$  take the respective positions  $C'$  and  $D'$ . Assume the angle through which the weight swings to be  $\alpha$ .

The centrifugal force on the weight acts radially along the line  $OC'$  and will be equal to

$$C.F. = \frac{w}{g} \frac{v^2}{r} \dots \dots \dots (1)$$

$$v = 2\pi r N$$

Where  $r$  is a variable and equals the distance from the center of gravity to the shaft center in inches.  $N$  equals revolutions per second of the ignition shaft.  $w$  is in pounds and  $g$  in inch-second units.

$$C.F. = \frac{w}{g} (2\pi N)^2 r \dots \dots \dots (2)$$

The moment arm  $L$  through which the centrifugal force acts to rotate the weight about its pivot is

$$L = \frac{(OA)(AC) \sin(\alpha + B)}{r} \dots \dots \dots (3)$$

This represents the length of a line drawn perpendicular to the line of action of the centrifugal force which acts along the line  $OC'$ . The moment due to centrifugal force acting on the weight is the product of (2) and (3)

$$\text{or Moment} = \frac{w}{g} (2\pi N)^2 (OA)(AC) \sin(\alpha + B) \dots \dots \dots (4)$$

As the weight swings outward the spring elongates and takes a position such as  $ED'$ .

$S$  = length of spring

$$= \sqrt{AE^2 + AD'^2 - 2(AE)(AD) \cos \alpha} \dots \dots \dots (5)$$

and since  $DE$  is the free length, the spring elongation

$$\delta = \sqrt{AE^2 + AD'^2 - 2(AE)(AD) \cos \alpha} - DE \dots \dots \dots (6)$$

If a spiral spring is considered and the following nomenclature is used,

$P$  = tension in pounds;

$r$  = mean radius of spring;

$n$  = number of turns;

$K$  = torsional modulus of elasticity for steel = 12500000;

$d$  = diameter of the spring wire.

the elongation of the spring is

$$\delta = \frac{64 P r^3 n}{K d^4} \dots \dots \dots (7)$$

Substituting the value of  $\delta$  from equation (6) in equation (7) and solving for the spring tension

$$P = \frac{G d^4}{64 r^3 n} \left\{ \sqrt{AE^2 + AD'^2 - 2(AE)(AD) \cos \alpha} - DE \right\} \dots \dots \dots (8)$$

The moment arm  $N$  through which the spring tension acts equals

$$N = \frac{(AE)(AD) \sin \alpha}{\sqrt{AE^2 + AD'^2 - 2(AE)(AD) \cos \alpha}} \dots \dots \dots (9)$$

And the moment of the spring acting on the weight about its pivot is equal to the product of (8) and (9).

$$(P)(N) = \frac{G d^4}{64 r^3 n} \left\{ (AE)(AD) \sin \alpha - \frac{(AE)(AD)(DE) \sin \alpha}{\sqrt{AE^2 + AD'^2 - 2(AE)(AD) \cos \alpha}} \right\} \dots \dots \dots (10)$$

For a state of equilibrium the moment exerted by the spring must equal the moment exerted by the centrifugal force of the weights.

Hence equating (4) and (10),

$$N^2 = \frac{G d^4 g (AE)(AD)}{64 r^3 n W (2\pi)^2 (OA)(AC) \sin(\alpha + B)} \left\{ \sin \alpha - \frac{(DE) \sin \alpha}{\sqrt{AE^2 + AD'^2 - 2(AE)(AD) \cos \alpha}} \right\} \dots \dots \dots (11)$$

This expresses the relation between angular rotation of the weight and the speed of the shaft.

A convenient manner for proceeding is to approximately assume the size and position of the weight and the position of the spring. The size of the spring can then be found by substituting the maximum value of speed and the desired value of  $\alpha$ .

The maximum stress in the spring should then be checked and should be less than 50,000 lb. per sq. in. in order that the characteristics should not change during service. If the stress and the space available for the spring are correct, a curve should then be plotted between  $N$  and  $\alpha$ , using equation (11). This shows the movement of the weight with speed. Some mechanism must then be utilized to convert the motion of the weight into shaft rotation, or, in other words, produce advance. Two types of such mechanisms are illustrated in Figs. 2 and 3. The

Fig. 3—Example of a link-type advance mechanism

pin and slot method of Fig. 2 is usually more convenient, since the slope and the length of the slot may be varied to suit any desired advance, while the links can be varied only through certain limits.

If the weights and spring have been determined and a curve has been plotted between  $N$  and  $\alpha$ , it then becomes necessary to apply a mechanism similar to Figs. 2 and 3, which will convert the motion of angle  $\alpha$  into rotation of the shaft which carries the ignition cam. This mechanism should be designed so that the resulting curve between speed and spark advance will follow points determined experimentally for the particular engine.

The use of a properly designed automatic advance ignition unit will produce greatest economy of automobile operation with the average driver. However, the throttle opening, amount of carbon in the cylinder, and the varia-

tion in fuels affect to a certain degree the proper point of ignition, and these variables are not taken care of by the usual automatic advance mechanism operating as a function of speed. These variations have led some manufacturers to apply hand control in addition to the automatic in order that the skillful operator can occasionally vary the ignition timing for best operation. There have been various attempts to regulate the advance by means of the throttle opening itself and also in conjunction with speed, but the complications involved are no doubt greater than the advantages obtained. Although the future may develop devices which vary the ignition timing through means separate from, or in addition to, speed control in an attempt to produce maximum economy, it is certain that present devices will fulfill the specifications required by the engine designers for a number of years.

## New Rotary Surface Grinder

A NEW machine designed for grinding rings, discs and cylinders which must have flat and parallel surfaces has been brought out by the Pratt & Whitney Works. It is of heavy, compact construction, permitting of heavy cuts and large output. It is claimed that sensitive adjustments, with convenient control, provide for rapid production on gear blanks, washers, cutter hubs, sprockets or other work requiring extreme accuracy. In addition, means are provided for grinding concave or convex surfaces.

The spindle is mounted on ball bearings provided with adjustments for wear. The wheel is cemented in a holder screwed to the spindle, which makes changing a simple task, and a band clamped around the wheel guards against breakage. Surrounding the wheel is an adjustable steel guard which covers the entire wheel when raised to the idle position, so that chuck work can be handled safely.

The rotary magnetic chuck has two speeds and can be tilted for concave or convex work. This chuck is controlled by a pedal, and a connecting brake retards the rotation when stopping. The magnetic chuck is controlled through a switch on the side, which also acts as a demagnetizer.

The wheel feed is controlled by a lever like a drill press, and a position stop is provided to grind to a specific thickness. Fine adjustments are made through a hand wheel which can be locked and used as a feed wheel when desired. Back lash is neutralized and the wheel slide is over-weighted for easy control and extreme accuracy.

The machine is equipped with a pump, and the tank is located within the column. Lubricant is supplied to the inside and outside of the wheel, the flow being regulated by valves, and an adjustable hose takes care of washing the chuck and work. The tank can be cleaned from a removable settling pan. The shut-off valve is ordinarily controlled by the feed lever, but can be disconnected and operated by a pull knob. The spray is confined by a guard, the front of which can be lowered for work handling.

Belt drive is regularly furnished and is fully guarded at all points. The main drive shaft and idler pulleys are mounted on ball bearings and the clutch is mounted on a thrust bearing to take the load. The two-speed gear shaft is mounted on bronze bearings and the gearing runs in oil, the bearings being lubricated by the splash system. A flexible coupling takes care of chuck tilt and alignment.

Pratt & Whitney 8 inch rotary surface grinder

## Great Britain to Stop Airship Development Work

IT was recently announced that the British Air Ministry had definitely decided to give up all its airship activities and hand over its airships, material and stations to the Disposal Board provided no offer was received before Aug. 1 from a British company prepared to take over and run the airships on a commercial basis. The airships available are the R 80, R 33, R 36, R 37, L 64 and L 71. Of these vessels the second last and last are the large airships surrendered by Germany in accordance with the Peace Treaty. Airship R 37 is nearly completed, but work has now been stopped on it, while R 36 is fully equipped as a passenger carrying vessel. These ships the Government is prepared to hand over, free of charge, to the proposed British commercial airship company. In addition, it is willing to present the company with all its other airship material and stores, to assist it with information, to lend it airship specialists for a limited period, and to sell or lease to it the airship stations at Cardington and Pulham. It is officially explained that the Government's decision to give up airships as a fighting service was arrived at only in view of the urgent demand for economy.

# Grinding in the Automotive Industry

## Part II.—Development of Specialized Forms of Grinding

The first grinders were employed for general work. A demand arose, however, for specialized forms, for grinding methods that could be used in production work. This article follows up the discussion of types of grinding wheels and traces the development of special forms of grinding.

By P. M. Heldt

**U**NDoubtedly the first class of grinding in the machine shop was tool grinding, because tools of hardened steel could be given a cutting edge only by means of the grinding wheel. The grinders employed, however, were not what are to-day known as tool room grinders, by means of which it is possible to grind geometrically exact cutting edges on the tools, but rather floor stand grinders. These same grinders were used for snagging and other offhand work, and are so used to-day.

The same as in the machine tool line universal types of machine, such as engine lathes, came into extensive use first, in the grinding field the first machines developed were universal grinders on which it was possible to do almost any job that might come up in the machine shop. Universal grinders still have a large field, in tool rooms and jobbing shops, and are to-day being manufactured in highly developed designs.

As the use of grinding as a manufacturing operation increased there arose a demand for grinders for special purposes which should have all the characteristics of production tools, that is, low cost due to simplicity of design, and a high degree of automaticity with consequent low labor cost and high output. The first type of production machine was probably the plain cylindrical grinder. In a booklet on Principles of Cylindrical Grinding issued by the Norton company there is illustrated an early type of cylindrical grinding machine made by Ambrose Webster about 1861. The machine has a rather primitive appearance and does not seem to have come into commercial use. Cylindrical grinding as a recognized machine shop operation is only a little over 30 years old. One of the first concerns to introduce it was the Geiser Mfg. Co. of Waynesboro, Pa. (now the Emerson-Brantingham Co.), manufacturers of agricultural machinery, including steam traction engines. About 1889 A. B. Landis built for the concern a machine for finishing the crankshaft bearings of these engines by grinding instead of draw-filing and polishing. The Geiser Mfg. Co. also was among the first concerns to grind piston pins and crosshead pins. It is related that the first machine built by Landis remained in practical use until 1915. Some trouble was at first experi-

enced because only a drip of water was used, but when a stream of water through a  $\frac{3}{4}$ -in. pipe was substituted for this the process proved a success.

Following is an enumeration of the different forms of grinding practised in the automobile and allied industries to-day:

Offhand grinding, including snagging of rough castings.

Cylindrical grinding.

Internal grinding.

Surface grinding.

Disc grinding.

Ball grinding.

Cam grinding.

Gear grinding.

Form grinding.

Tool grinding.

A representative machine of the universal type is the Bath, manufactured by the Universal Grinding Machine Co. With the aid of a number of attachments it can be

Fig. 1—A typical universal grinding machine equipped for cylindrical grinding

Fig. 2—A form of back rest used in cylindrical grinding. (Brown & Sharpe design)

used for cylindrical, internal, surface, cutter and reamer grinding. An illustration of this machine is shown herewith. The base is a single casting of column form, to the top of which is bolted an internally ribbed vertical column with a circular flange base as large as the machine base. To this vertical column is gibbed the grinding wheel head, which has a vertical movement. The cross slide knee, which carries the cross and longitudinal slides, has a large circular base that fits over the cylindrical part of the vertical column, thus providing a bearing of liberal dimensions for the knee to swivel on, the knee being swung around the column to bring the work table into the proper relation to the wheel for the various operations the machine may be used for. The knee is graduated in degrees and can be clamped at any angle from 0 to 90 degrees.

The cross slide provides means for feeding the work into the grinding wheel and carries the work table and operating mechanism. The table is provided with a swivel plate for grinding tapered work and has a scale graduated in in. p. ft. and in degrees. With the regular equipment the machine is adapted chiefly for cylindrical grinding, the work being held between centers in the head and footstocks or in a chuck in the head stock and revolved. The footstock spindle is provided with a variable tension spring controlled by a handwheel and quick acting lever, as usual in cylindrical grinding machines, but the spindle may be clamped rigidly for holding the center to the work. The table is controlled by adjustable dogs operating against the reversing lever, which latter actuates the reversing clutch, or it may be controlled by a conveniently located hand reversing lever, which provides means for stopping the table at the end of its traverse automatically, by giving the lever a part of a turn at any time during the traverse of the table.

An automatic cross feed is provided for cylindrical grinding, which operates at each reversal of the work table and can be set to reduce the diameter of the work from 0.00025 to 0.005 in. The automatic cross feed operates at either reversal of the work table or at both reversals. For duplicating work there is a stop on the cross screw hand wheel. Work and traverse speeds are independent.

For internal grinding a rigid attachment is bolted to the side of the column near its base, in which the wheel spindle is supported, the latter being driven from a

pulley which is clamped on the nose of the main wheel spindle. The work is held in a chuck. For surface grinding another attachment is furnished, which is secured to the grinding wheel head. The attachment spindle is screwed to the main wheel spindle and is driven through it. In this case the table is swung around through 90 deg. A universal work holder is furnished with the machine which adds to the variety of work which can be done upon it. This holder is particularly valuable in tool grinding.

In cylindrical grinding where the work is held between centers or in a chuck, it is revolved in the same direction as the wheel; that is, if the wheel turns right-handedly the work is also revolved right-handedly, so that the surfaces of the work and the wheel between which the grinding action takes place move in opposite directions. In internal grinding where the work is held in a chuck, work and wheel turn in opposite directions. Sometimes parts have to be ground cylindrically that cannot be held either in a chuck or between centers. They may then be laid in a Vee block and the wheel fed up against them, in which case the work will be revolved in the opposite direction as the wheel, so that the surface motions at the points where grinding takes place are in the same direction. While this is not as satisfactory as having wheel and work revolve oppositely, cylindrical surfaces can be obtained in this way.

The motion of the wheel head in the direction of the wheel axis is known as the traverse. Naturally a grinding wheel cannot remove a great depth of metal at one passage, and the grinding wheel is therefore traversed continuously, being fed forward automatically at the end of each traverse or after every second one. In repetition work the feed stops automatically when the work has been reduced to the desired diameter. Of course, wear of wheel is not allowed for in this, but the operator soon learns how many parts he can grind before the wheel has worn down an amount equal to the smallest possible adjustment of the cross slide, and he will then make the adjustment after passing that number of pieces through.

Plain cylindrical grinding machines are manufactured in a great variety of designs. They usually have a box-casting type of base with headstock and footstock jibbed thereon, a wheel head, gearing for driving at various speeds the work spindle and the wheel spindle, a drive for traversing the wheel and automatic mechanism for reversing the wheel travel and feeding the wheel toward the work. In addition to the automatic feed mechanism there is provision for hand feed.

### Steadyrests

When long, slender pieces have to be ground, trouble is likely to be experienced from shattering, and in such cases steadyrests should be used. These comprise two shoes or saddles with a face in the form of a cylindrical segment of the same radius as the finished piece. The shoes may be made either of wood, brass or hardened steel, the latter material being preferable when a large number of parts of the same dimensions are to be made. One shoe should be located underneath the shaft or other piece of work. Some makers recommend placing it as close to the wheel as possible, so as to take the substantially tangential component of the reaction between the wheel and work and overcome the drawing-in action of the wheel. The other shoe is located opposite the point of contact between wheel and work, so as to take the radial component of the reaction. Both shoes should be of sufficient width to span any slight inaccuracies in the circumference of the work. Steadyrests are provided with screw adjustments for both shoes so as to adapt them for use with work of different diameters. In grind-

ing camshafts, steadyrests of the enclosed type are often used, somewhat similar to lathe steadyrests, in which the camshaft turns under very much the same conditions as when assembled in the engine.

### Surface Grinding

Plane surfaces are ground either with the circumferential surface of cylindrical wheels or the ends or faces of ring wheels. In the ordinary surface grinder the work is mounted on the table which is jibbed to the base, table and work being fed past the stationary wheel head. Where the grinding is done with the side of the wheel the wheel spindle may be either vertical or horizontal and the work table fed past the wheel head or else the work table may revolve around its axis. When grinding with the side of a ring or cup wheel the cutting area naturally is comparatively large, and, in consequence, stock is removed quickly and great power is absorbed.

In addition to grinding plane and cylindrical surfaces it is also possible to grind surfaces of revolution whose section comprises one or more circular arcs or even irregular curves and straight lines. This is known as form grinding, and its most important applications in the automotive industry are in the grinding of ball bearing rings and of the grooves in splined shafts. In order to do this grinding the grinding surface of the wheel must be given the proper form by truing it with a forming device. Circular arcs can be easily formed on the wheel by mounting the truing diamond on a pivotal truing device having the proper radius. For irregular shapes the diamond must be guided by a former of the same shape as the section of the cutting surface to be produced. The majority of ball bearing rings, especially in the larger sizes, are ground in oscillating grinders, but some of the smaller rings are ground in plain grinders with formed wheels.

### Disk Grinding

Disk grinders are machines in which a circle of abrasive material is supported by a steel disk. Originally this form of grinder was used only for polishing and light finishing, but recently the disk grinder has come to be quite a production machine. The machine is used chiefly on work which has previously been turned, shaped, planed or milled, so that it has one true surface to which the surface finished in the disk grinder is usually perpendicular. Disk grinders are of exceedingly simple construction. The usual single spindle type comprises a floor stand with two split bearings at the top in which

Fig. 3—Disk grinder with hand lever feed (Diamond)

are supported the spindle carrying clamping collets for the two steel disks and the pulley by which it is driven. Tables on which the work is held are mounted in such a way as to be universally adjustable. In the more elaborate designs ring wheel chucks can be substituted for the disks, the tables are provided with T grooves and are fed toward the disks by means of a hand lever. The abrasive circles are cemented to the disks by means of a special press furnished with the machine.

Plain tables which are rigidly clamped in position are used when the work is to be forced against the disk for squaring up and when a small amount of stock is to be removed. Semi-universal swinging tables are provided with a counterweight, which permits of swinging them across the face of the disk, thus facilitating rapid removal of stock. Universal swinging tables have a tractor in addition to the counterweight, which makes it possible to accurately grind angles on them.

When it is desired to produce duplicate parts in large quantities and remove considerable stock, use is made of a universal lever feed table. The table is fed toward the disk by a lever and link motion, the feed being limited by a micrometer stop.

(To be continued)

## Condensers in High Tension Circuits

IN Germany tests have recently been made on "spark intensifiers" in the form of condensers in the secondary circuit, connected across the spark plug gap. In an article on the subject in *Der Motorwagen* it is claimed that the auxiliary gap type of spark intensifier is of little practical use; that the effect of such intensifiers on the spark cannot be noticed by direct observation and that the effect on the ignition apparatus is detrimental, especially if the auxiliary gap is located close to the spark plug. With a condenser in parallel with the spark plug gap, very favorable results are said to have been obtained. The effect is to produce during the sparking period condenser discharge oscillations which are remarkable on account of their high capacity and current strength. Experiments have shown that condensers of from 250 to 400 cm. capacity are best suited.

Tests on engines fitted with condensers in parallel to

the spark plug gaps were made the past year by Professor Becker in the Internal Combustion Engine and Motor Vehicle Laboratory of the Berlin-Charlottenburg Technical High School. When visibly operating spark plugs were provided with a condenser in parallel, a material increase in spark volume was observed. Comparative tests on a 10-25-hp. Adler automobile engine with and without spark intensifier showed an increase of 14 per cent in the output at 1000 r.p.m. when operating on a benzol-kerosene-gas oil mixture of the proportion 40:50:10, and an increase of 6 per cent in output at 1400 r.p.m. when operating on kerosene. A test run with a 16-45 Mercedes-Knight-engined car showed that with the same carbureter adjustment the car would run on one liter of fuel, 5.9 km. with condensers and 5.2 km. without, indicating a saving in fuel of 13.5 per cent when condensers were used.

# Production Methods in Armature Manufacture

Several details of the armature manufacture described here are well adapted to other production work. The article presents, moreover, an intimate discussion of production methods in making this widely used unit. The importance of the human element appears in several instances.

By Norman G. Shidle

**M**ANUFACTURING methods in parts plants are of interest to the automotive engineer and production man in several ways. By studying such methods he becomes familiar with the details of practice in the related industry and is better able to discuss design and specification problems with relation to production limitations. Production in parts plants, moreover, frequently includes minor production methods which may be advantageously adapted in the manufacture of other units made within the automobile plant itself.

Both these advantages are to be found in examining the production of the generator armature for a well known passenger car at the Springfield plant of the Westinghouse Electric & Mfg. Co. The equipment used for stamping out the core laminations, for instance, carries excellent suggestions for stamping out other flat metal parts, while the knurling operation on the armature shaft is performed in a specially efficient manner. There is a general interest, too, in the importance of the human element in certain key operations. These factors can be examined in proper perspective through a detailed description of the production operations.

There are nineteen operations in the shaft. Fig. 1 is a drawing which indicates the form of the finished shaft. The first operation is performed on an automatic screw machine. This machine turns and faces the rough stock, necks the shaft in two places, centers one end, and cuts off the piece.

One end is turned and threaded in the next operation, which is performed on a Warner & Swasey lathe. The other end is also centered. A Wisconsin hand miller then cuts the keyway.

The next operation is that of grinding the shaft for knurling. The shaft must be ground down to allow for the increased diameter which results from knurling. The knurling operation, next performed, is specially interesting, since the method used permits of high production, and yet is comparatively simple. Fig. 2 is a close-up of the machine on which the knurling is done. The shaft is placed in the slot at the inside of the table. The knurling tool, shown in the photograph, is a flat piece. It is given a rectilinear downward motion like that of a stamping press, turns the shaft, and imparts the knurl.

The knurlings serve the function of firmly holding the laminations in any degree of spiral arrangement of armature slots and of taking the place of the various types of keyway necessary with other methods.

After having been knurled, the shaft is heat treated and tempered. It is then necessary to clean the centers and straighten the shaft, since some slight warping usually results from the heat treatment.

A series of six grinding operations are next performed on Norton grinders. First the commutator is rough ground, then the main bearing and the gear seats are rough ground. Finish grinding the small bearing follows next, and then the finish grinding on the gear seat, commutator seat and main bearing in order. The shaft is then sent to a lathe and the shoulder on the back of the oil thrower is faced. An inspection of the shaft completes the operations on this unit.

## Punching Core Laminations

The metal sheets from which the core laminations are punched are "coated" immediately upon arriving at the plant. This work is done with a machine which facilitates the handling of the bulky material. The sheets are placed on a continuous conveyor and are moving steadily while

being painted with a rust preventing and insulating compound.

The sheets are then slit into strips of a width suitable for the press work. Slitting rolls are used for this operation, by means of which a number of strips can be slit at the same time. The slitting rolls are illustrated in Fig. 3.

The next operation, that of stamping out the core laminations, is performed in a specially effective way. A Bliss 73¾ power press is used, and a special three part die stamps out the pieces. Like all the other presses and machine tools in the plant, this press is operated by an individual electric motor. The press is equipped with rollers on each side. The strip of metal is inserted in the rollers on one side, the rollers are started moving, and the strip moves through the die and is pulled out through the rollers on the other side. It is necessary for the operator merely to insert the strip in the rollers and start the press. There is no danger connected with the operation, and the production capacity is greatly increased by means of these rollers. The speed of the press can be regulated in accordance with the kind of work, and the principle involved is applicable to innumerable stamping jobs of similar character.

There are three parts to the die, as noted previously. The first die stamps the main outlines of the laminations, the second die straightens the piece, and the third part pushes it through the die. Fig. 4 shows the details of this operation and the dies which are used in its performance.

Fig. 1—Drawing of finished armature shaft

Fig. 2—Knurling machine. Fig. 3—Rolls used in slitting metal to sizes suitable for punch press in punching core laminations. Fig. 4—Roller feed punch press and dies used in stamping core laminations. Fig. 5—Assembling core laminations to shaft

### Assembly Begins

The next operation consists in placing a given number of core laminations together, the same side up in each case, and of tying them together. This is known as the "match, weigh, and tie operation," the number of laminations being determined by weight. The tying is done simply for convenience in handling.

Next the laminations are staggered to the proper degree and are held in that position by means of specially made skewers, whereupon they are placed in a die in a Lucas press. The knurled shaft is then forced through the laminations as shown in Fig. 5. It is evident that very careful work must be done in grinding and knurling the shaft, since the diameter of the knurled part of the shaft and the diameter of the hole in the laminations must bear a very exact relation to each other. The knurled part is forced into the compressed laminations, holding them firmly. The slots are filled during the next operation.

The commutators are obtained from the commutator department of the Westinghouse plant at Pittsburgh practically finished. The commutator slots are merely milled and burred, and the commutator is inspected.

Insulation, in the form of a heavy fish paper, is next placed in the slots of the core. This is followed by the

important operation of winding. It is difficult to describe the intricacies of this operation in a few words, although the general principles are commonly understood. To perform this task efficiently and accurately, however, takes many months of training and experience. It is the sort of job that a person must learn through practice, and it is one of the important key operations in armature manufacture.

It is interesting to note that the human element enters into this work so strongly at this vital point. On some jobs, the increased labor supply during recent months has made easier the obtaining of skilled workmen, but on this operation, which can be done by only a few, the labor surplus has had practically no effect. The degree to which the human element enters into any given operation varies, of course, but there is no industrial work into which it does not enter in an important way if observations are made over a long period of time. This winding operation is interesting as one of the more obvious examples of the importance of this phase of production studies.

After the cores have been wound, they are tested for grounds. This work is done by girls, but the winding operations are performed by men. Next the commutator and oil thrower are pressed on. The armature then goes to

Fig. 6—Scraping and connecting lead wires

girls at a bench, the wires are scraped and connected, and the leads are set and sweat soldered to the necks of the commutator bars.

Special shaped white fiber wedges are driven into each armature slot over the coil winding. The desirability of this is apparent.

The large diameter of the commutator is turned in a lathe and the armature is then inspected and tested. The armature is then ready to be dipped and baked. It is dipped in a varnish solution and is then baked in specially constructed ovens. This process is gone through twice. Prior to the first dip, however, the entire unit is thoroughly dried.

When the armature comes from the oven the shaft is cleaned and is inspected for straightness. The face of the armature parallel with the shaft is then ground, followed by a bearing grinding operation. The next operation takes the armature to a lathe, where the commutator is turned and the oil thrower is faced to length. Next the oil thrower is faced to gauge, and the commutator is turned again. The mica insulation between commutator bars is then undercut on a hand miller, and the commutator is polished on a lathe.

The armature is then balanced and passes on to a final inspection, after which the style number is stamped on it. A cotter pin hole is drilled in the shaft and this is followed by the necessary re-threading operation. This completes the process of manufacturing the automobile generator armature.

When working at capacity, about 1200 generator armatures can be produced per day, a force of 480 men being engaged on armature work.

The automotive section of the new plant has a capacity of 1000 generators and 1000 starting motors a day, and employs about 1000 men for peak production.

The relation of the human element to production is well illustrated in the experience of this plant. As in most other factories, it has been necessary to lay off a number of workers since the beginning of the industrial depression. The employment department made an effort to keep in touch with these men, so that they might be reinstated when business picked up again. Recently it was found necessary to increase the working force considerably. Old employees were sought. Many of them were brought back into the plant, thus saving much money which it might have been necessary to expend in breaking in new workers.

It was found, however, that the better workers in a few cases had already found jobs elsewhere and were not avail-

able. This is an indication of the fact that a good workman is likely to be valuable even in times of depression; that it is important in laying off men to consider carefully the future when it will be necessary to build up the force again.

The efforts to keep in touch with former employees at this plant have resulted in great benefits already in up-building the force again. It has been found well worth while to follow up former employees, to have them leave the plant with a feeling of goodwill, and to have them eager to return again when the opportunity offers. It is not the policy here to "take it out" on labor for past conditions. The maintenance of rates once set, and a general attempt at practical honesty is producing excellent production results.

## Tests by the Bureau of Standards of Centrifugally Cast Steel

**T**HE production of metal castings by the centrifugal process may be said to have passed beyond the experimental stage; at least, in the case of certain non-ferrous metals and cast iron shapes. However, very little appears to have been published concerning centrifugally cast steel. Opportunity was given to the Bureau of Standards to examine in detail the physical and chemical characteristics of six centrifugal castings made by the Millsbaugh process.

The results are interesting since they show what may be expected from such metal as compared with the product of more usual manufacturing processes. The advantages to be expected from centrifugally cast steel are physical soundness and freedom from chemical segregation and thus the elimination of waste metal to be discarded, which last is always a very important factor in other casting processes. For certain shapes forging and boring operations may be eliminated.

The investigation shows that highly satisfactory castings which are physically sound and free from serious segregation, can be produced by the centrifugal method. It is shown that the properties of these castings can be greatly improved by subsequent heat treatment, the resulting metal being in a condition to compare favorably with metal that has been forged.

Technologic Paper No. 192 of the Bureau of Standards dealing with the above subject may be secured from the Superintendent of Documents, Washington.

# Patching Body Panels—a New and Important Service Problem

Mr. Mercer recently visited many service stations and found that practically none of them had proper knowledge of body panel repair methods. Factories were not helpful. The problem is growing and demands attention of manufacturers. Repair methods are discussed here in detail.

By George J. Mercer

**W**HILE the average life of a car is something over five years, the body begins to deteriorate materially during the second season. Many minor faults, such as dullness of paint, worn spots in trimming, doors out of alignment, etc., often begin to show up. Such defects, perhaps, are to be expected to a certain extent, and the owner is usually willing to bear the burden of such renewals or repairs as may be necessary.

Where an actual break in the metal panels occurs, however, a different situation is presented. Such breaks do occur, and in most cases the owner is likely to protest loudly that he has not received fair service from his car. Consequently, the matter of repairing damage of this kind is extremely important.

Before discussing the methods of repair for steel and aluminum panels the causes of the breakage may be analyzed, since to eliminate those causes would be to eliminate the damage and the dissatisfaction. There are two chief causes to which such body breakage may be attributed:

1. Unfair conditions of usage
2. Inferior quality of workmanship

Extreme weave of the chassis frame usually results from sudden stopping and starting, rapid acceleration and other similar jars to the frame. Every violent swing twists and strains the car body. It is only a matter of time until the framing will weaken at vulnerable points and cause the metal to break through continual bending.

Roadsters and coupes generally give out first around the door opening of the rear compartment, because the opening space makes for high local stress at the four corners. If these points are rigid enough to withstand the strain, the joint between the rear deck and the rear panel is likely to part. This latter point is indicated by the letter "A" on Fig. 1.

Inaccurate design or poor workmanship often show up in improper fitting of the body to the frame. Subsequent body injury is invited when the body does not fit easily and without forcing at the points at which it is bolted to the frame. If the body is pulled down to make it touch at the bolt hole, the framing will bend and the panel will break at some place near to that at which the pressure is exerted. Strains will be set up, moreover, in other places by the pulling stress on the framework.

Poor workmanship also shows up in many other ways. Sometimes, for instance, the wood is so framed that a joint will come opposite a panel joint where excessive strains will occur. Again, joints may be poorly made

or the wood not well dried, so that it shrinks after being framed and draws away from the joint. The panels may be filed too thin at the welding points. This defect frequently occurs and is not readily detected until a break actually occurs.

In normal times few of these deficiencies should be present, but the results of the comparatively unskilled labor that was rushed into service during the last few years are showing up at this time.

The causes of the trouble being fully understood and the importance of such difficulties recognized, means for remedying breaks after they do occur must be devised. Methods for repairing steel and aluminum differ slightly, and both will be discussed here.

Steel is really the better material for panels for several reasons. The most important of these may be enumerated as follows:

1. It has greater strength
2. It is possible to join steel panels in such a way that they are as strong as any other part of the body
3. Irregular places can be filled with solder
4. There is less reason to file thin at joint points
5. Repairing is more simple; welding a piece into a steel sheet does not require the fine and intricate work necessary in welding an aluminum sheet
6. Although aluminum can be welded, it must be hammered and filed. Solder cannot be used for filling up irregular places

Assume, for instance, that the break at "A" was in a steel panel. It is probable that the break could be welded, the irregular part around the new weld filled with solder, and the underside reinforced to overcome weakness. Painting would then be the only additional operation necessary.

If the steel sheet is thin at the point of breaking, or if the cooling metal breaks at the same place after the first welding attempt, the material must be cut away until sound metal is reached. A piece can then be welded in. The metal should be lightly hammered around the weld as it cools. Water should never be used for cooling. The heat is kept within a small radius and protection is afforded the wood underneath by means of loose asbestos, packed tight by wetting with water. This asbestos is packed between the wood and panel and a ring of the same sheet is used around the weld. Just enough space is left to provide convenient working area for the torch. The roughness of the metal is leveled up with solder.

Suppose, however, that the same break occurs in an aluminum body. The procedure would be different. The first operation is to cut away the metal on all sides of

the break and insert a piece of size and shape suitable for the particular space.

An example of this operation is shown in Fig. 2. This piece or insert is slightly smaller than the opening, so that a space equal to the thickness of the metal sheet separates the edges of the panel from the insert on all sides. Thus the flame from the torch is allowed to pass clear through and to build up the weld from the bottom.

In Fig. 2 the break is shown cut away and the insert in place. The space, equal to the thickness of the metal all around, is also shown. To make the repair, the part to be welded is surrounded by wet, tightly packed asbestos fiber. This fiber has been hand molded into a ring and is placed as near as possible to the work. The piece is held in place until the welder can make a catch-hold at one or two places. Then the surface of the insert and panel are leveled with a hammer. The welding operation is then continued until the work is completed.

The welding outfit for repair work consists of the oxygen-acetylene tanks, a moderate small size nozzle and a strip of aluminum sheet about one-half inch wide, cut from a panel of the same thickness and character as the sheet forming the panel and the insert. This strip of aluminum is used in the same manner as solder. No acid is used, but the parts are cleaned with a file or emery cloth. The end of the soldering strip is warmed with the torch and dipped into the aluminum flux. This operation is repeated until the flux adheres to the end of the strip. The work of welding is rapidly performed by melting the fluxed end of the aluminum strip with the torch until the space between the insert and the panel is bridged and the two become one. A good welder working quickly will not add much thickness at the weld or allow the heat to be stationary long enough to distort the metal surface. These defects will be noticeable to some extent, of course, but if it is possible to use a hammer, most roughness can be leveled up and the file will do the rest.

Solder cannot be used to fill the uneven places as with steel. All leveling must be done by the file and hammer. Therefore, the aluminum welding operation must be done very carefully, since only a limited amount of filing can be done; in fact, the original break is often due to filing the sheet too thin in an attempt to level the panel. In this way the strength is greatly decreased and the least strain causes a rupture.

### Difficult Repairs

When the weld has to be made over part of the wood framing, there is no chance to get at the under side to bring up dents or depressions. In such cases the leveling can be accomplished by inserting a thin strip of steel between the wood and the metal. By rubbing with this thin strip, the low points and depressions will be forced up.

Another method is shown in Fig. 3. Here a part of the panel is dented down over the framing. The illustration shows a counterbore from the under side of the wood. This should go about half way through; then, with a flat-end punch, the wood forming the bottom of the hole can be forced up. The wood will then rise over quite a large area and raise the panel evenly for quite a distance around the hole.

The welding operation described above is not novel,

nor has it any features that will attract the attention of the man who is working in some of the large shops where this work is going on every day. Considering the number of shops interested in bodies, knowledge in respect to properly repairing panel breaks is not very large. Even some well-equipped repair shops are not sure of the best methods of making repairs on a broken aluminum panel. Just to be able to know that it can be successfully done is a matter of no small importance. It can be successfully carried out by the ordinary good workman who has had experience with welding. A good aluminum weld will be just as strong as any other part of the sheet.

Every repair shop is equipped with a welding outfit. The flux, of which there are several makes on the market, is easily obtained, and with a little patience at the start this work can be done on any part of the body with confidence that the result will be satisfactory.

When a break occurs it is necessary to make sure that there are not inherent weaknesses or unnecessary strains in the frame that will cause the metal to break again at the same place. The very fact that a break has occurred should indicate the necessity of making doubly sure by adding some reinforcement in the shape of a plate or corner iron. If, however, the break has occurred because the original panel was filed too thin, then the matter of reinforcement need not be considered.

Strains concentrate on the body at certain points, such as the bottom of the doorway, the corners of the opening on the rear compartment on roadsters and coupes or the small doors into the rear compartment on the side of roadster

bodies. Whenever possible, a vee should be cut across to allow the panel to weave slightly without crumpling. A vee is the safest where moldings butt and there is thickness to each piece; in fact, a vee should always be used if the length and location will not make it look unsightly.

### Cautions

One bit of caution should be given about the use of asbestos fiber on the panels when welding. In theory this is the ideal way to curtail the space within which the heat will operate and thus protect the general surface of the panel. But it has to be used with caution, because, when applied, more heat has to be used at the weld than if no asbestos were used. Therefore, there will be a tendency to use so much heat at the welded spot that the metal becomes fluid and consequently quite a large spot may fall away entirely.

This has been discovered in shop practice also with regard to the use of cast iron forms. When welding was first practised on aluminum sheets, cast iron forms were used to draw the heat away from the sheet and keep it more nearly level during the work. It has been found, however, that better and quicker work can be done without any agency to assist the sheet in cooling. When the heat is drawn away, the amount of flame needed to make a weld is much greater. Consequently, the sheet often will flow before the weld is made. The asbestos will do the same as the iron form. Therefore, unless it is needed to protect the wood frame or keep the paint surface protected, it is best to dispense with the use of anything that will cool the panel.

FIG. 1

# Relation Between Factory Service and Engineering Departments

Perfect cooperation and accord is not always secured between the factory service and engineering departments. The subject is treated by an engineer and by a service manager in the two articles following. Each one presents his point of view in a forceful and interesting manner.

- I. By B. B. Bachman\*  
II. By E. V. Ripplingille\*

## I

**I**N preparing this paper for you, I found myself, first of all, at a loss for a title which might in some degree serve as a text around which I might build my subject.

It may be well in starting to arrive at some definitions so you may know what I have in mind when using certain terms. I do not ask you to accept these definitions as complete, as they relate to complex things about which our ideas are changing as new conditions arise and experience gives us a broader viewpoint.

The first thing I will try to define is service. Of all the abused phrases which fall from our lips with ill-considered glibness, the majority will contain either the word service or co-operation. They sound well, and we love to roll them under our tongues and taste their sweetness. But what is service? As I can see it, service is that which, being exercised by the individual or associations, obtains good will.

Service is, therefore, honest because the one who would render it to obtain good will cannot succeed if he seeks to take advantage by wilful misrepresentation of those with whom he is dealing. Service is also just, for if by chance misrepresentation has been made, or if full value has not been given for the consideration received, then service demands that these things be corrected. On the other hand, if the buyer wilfully attempts to take advantage of the frankness and honesty which characterize service, then justice demands that such claims be refused.

This definition is too broad for our purpose, however, for it goes back to the character of the individual or individuals responsible for the policies of the business, and is manifest in every activity of the business. Service, as I would define it for use in this paper, is the function of the Service Department, and this department in our business is charged with the establishment of repair stations, with adequate equipment, personnel and stock, in such locations as to insure our customers having access to facilities which will be capable of supplying their needs in the proper maintenance of their equipment at a fair cost if they wish to use them.

Engineering is also a broad term. It has been defined as the utilization of forces and materials in the development of the products and services of industry. Such a

definition embraces the entire activities of the race. Again I would, for our immediate use, restrict the definition of engineering to the functions of the Engineering Department, which is charged with the creation of designs, the furnishing of drawings and specifications to the Production Department by means of which these designs may be translated into the finished product, and the preparation of such technical information as may be required by the Sales Department in sales and application of the product, and by the Service Department in the adjustment and repair of the product as well as instructing the owner in these things.

In discharging the first function, the creation of designs, the Engineering Department must provide itself with men having the requisite training in technical theory and the practical experience in production and operation, which will enable them to view the result of their work as an article of commerce and utility. There must also be provided equipment for analysis and testing of materials and structures to prove their fitness and the degree of success with which they function.

In addition to this, a successful design can result only from a sympathetic consideration of problems of sales, production and maintenance. Probably no design can ever be called complete. Changing conditions of use, new and more efficient methods of production, new materials, weaknesses which seem to develop only under the strain of actual operation and features of construction which hamper and make for expensive repair operations are continually coming up, and these call for changes.

No matter how broad a viewpoint the Engineering Department may have, it cannot hope to contain within itself the sources of information which will enable it to understand thoroughly all these different factors. Therefore, it becomes necessary to consult with the Sales Department with regard to uses, markets, etc., with the Production Department regarding equipment available, methods to be used and their relation to the form which the various parts shall take, and with the Service Department on the manner in which the apparatus functions, where weaknesses are apparent and where improvement should be made to increase efficiency, lengthen life and secure greater simplicity and accessibility to make maintenance cheaper.

Now that we have arrived at a definition of the Service and Engineering Departments, together with a conception of their relative positions in an organization, we can proceed to consider the relation which they bear to each other and how they should work together.

\*Mr. Bachman is engineer for the Autocar Co. and Mr. Ripplingille is service manager for Hudson Motor Car Co. These papers were read at the recent N. A. C. C. Service Managers' Convention.

From what I have said you will understand it is my belief that the Engineering Department must depend upon field reports for information which will enable it to satisfactorily solve many problems. In order that this information shall be authoritative and of the greatest value, it should be complete and accurate. Gross defects in design, material or workmanship will be brought to light even if there is no organization to collect data by the complaints of the user, but such conditions should not exist if the Engineering Department is properly efficient. The art of motor vehicle design and construction has passed the days when, due to lack of engineering data, errors of this sort should occur.

For the more difficult task of closely observing operation, for the minute study of repair work to observe evidences of little things which, by their frequent recurrence in a large volume of cars in operation, become serious, and the scrutiny of operation to determine those features of design which cause unnecessary expense, an experienced and efficient organization must exist and it must function with proper methods.

Most men do their best only when spurred to do their best, and one of the most efficient spurs is criticism. I mean by this, criticism which arises out of an opinion supported by an understanding of the subject which can be obtained only by study. Only too often criticism is the result of unfounded prejudice, although I am frank to admit that prejudice is not always the attribute of the critic alone.

We hear the word "constructive" linked with criticism many times, and too often this is interpreted to mean that with the criticism should come a suggested remedy. I do not believe that this is essential; and certainly in the case which we are considering, criticism should not be withheld because it is not supported by a means of cure. This is the Engineering Department's job.

The thing the Engineering Department wants to know quickly is the effect; if the cause can be given at the same time, so much better. If a means of curing the trouble can be suggested, either in form or principle, better yet; but if the effect only can be reported, give us that. If we have knowledge of the trouble, we ought to have the ability and means to find out what causes it and how to cure it. As a matter of fact, the Engineering Department is often hindered in corrective troubles because the deduction as to cause has been in error and a remedy is suggested and vigorously supported, with the result that if adopted no improvement is made, and if not adopted a more or less lengthy scrap ensues, till the means actually adopted is sold. Again, I must hasten to add that I am not taking the position that the engineer "can do no wrong."

On the other hand, in indicating wherein improvements can be made to facilitate repair work, it is highly desirable that suggested constructions be submitted, because no one should be better able to do this than the repair man. Naturally, other considerations which the repair man has not taken into account may make it impossible to incorporate such suggestions, but this is again the engineer's part of the job.

Another way in which these two departments can assist each other is in experimental and research work. I have stated above that laboratory and field engineering tests are not 100 per cent. It takes the hard bumps of actual service to put their ideas through the refiner's fire. It is certainly not good policy to let experimental features go out in quantity production. Therefore, by the assistance of a properly organized Service Department, these designs can be put into actual service in

the hands of and under the observation of those who have not creative pride to temper their critical viewpoint.

To do these things which I have suggested there must be a systematic method and a proper organization. I hold no brief for any system, nor for any particular form of organization, and am not going to bore you by attempting to outline either in detail, because if you have thought on the matter you probably would not agree with me, and, if you have not thought, anything I might say would be of little or no benefit.

In principle, however, the Service Department should be in charge of and have in its personnel some men with an engineering training and a sympathetic understanding of the functions and policies of the Engineering Department, in addition to the other qualifications which fit them for their work.

The Engineering Department, on its part, should be free from the professional limitations too often manifested in the intolerant attitude adopted toward the opinions of those who have the temerity to suggest that there may be other and better ways of doing things than they have advocated.

For the reason that the collection of the information, which I have indicated the Engineering Department wants, really partakes of the nature of technical data, it should be collected methodically and recorded accurately. This will naturally involve the use of standard forms, etc.

Stock inventory files should be followed to note the distribution of repair material with regard to kind, quantity, locality, service conditions, etc. For instance, engine parts may be affected by fuel and lubricants, which vary in different localities, or a part which will perform with entire satisfaction in one class of work will be inadequate in another.

Repair orders also afford a fruitful source of valuable information as to the character of work which is required. Study of the ratio of labor time to material used gives an index as to the accessibility of the design, as well as to a means of comparing the relative efficiency of methods employed by different shops.

Records kept of new designs and comparisons in performance with old forms to judge their value is another activity which, when carried on in a practical manner, is valuable. Naturally, it should be pointed out that these things can be done effectively and thoroughly with little red tape or fuss, or they can be so completely hide-bound in system as to result in little beside overhead.

A very important activity of the Service Department is education, in operation and in care, adjustment and maintenance. On new designs the information for use by them in this work must be furnished by the Engineering Department. From an ideal viewpoint, possibly, no design should need explanation; but though the automotive vehicle has traveled far, it is still a great way from such a state of perfection.

For this reason assembly and sub-assembly drawings, which will be intelligible to the repair man, should be prepared which will enable him to grasp the principles of construction, and, on being interpreted into his own and the user's language, used to build a defense against possible trouble which might result from lack of attention to some relatively slight detail.

You will probably recognize the fact that my views are predicated in large part on a homogeneous organization which can probably exist only where the manufacture, sales and service functions are carried on by

one organization. Where selling and service is handled by more or less independent dealers, other problems, no doubt, arise. With these, however, my experience gives no warrant for the attempt to say anything. My views are naturally colored strongly by my own experience and that of the company with which I am connected.

You may logically ask the question that in the organization with which I am connected do the Service and Engineering Departments function together in the matter above outlined. Answering this frankly, I would say that neither of us feel that we have reached a point of perfection; but with due allowance for the frailty of human natures, I am of the opinion that the relationship between the two departments is as near ideal as could be expected, and there is no question as to the existence of a completely co-operative relationship.

## II

The subject of the relationship between the Engineering and Service Departments is idealistic to the extreme. In my humble opinion the only way to express it is "the implicit confidence of one department head in the other." Surely, such a relationship cannot be other than beneficial.

Let us assume that the definitions of "engineer" and "service manager" are understood according to our individual ideas, but with this exception, as far as the writer is concerned, the engineer must possess as near 100 per cent theory as possible, regardless of other qualifications—and the service manager as near 100 per cent practical knowledge as possible, regardless of the amount of theory. Co-operatively, two such individuals will absorb so much from one another that, unhindered by outside restrictions, the result on the product will be fundamentally perfect and universally practical. This, you will say, is the millennium.

So far we have considered the ideal. Let us now look at the practical side; for it must be realized that there are certain limitations imposed by the personalities involved in both departments.

Except in a general way, there can be no defined rules as to the extent and methods of co-operative effort between engineer and service manager because the nature of the functions of each vary directly with the design and cost of the car or truck. Obviously, the most simple design and the lesser cost will present the least problem as to the necessity for constant intercourse and detail consideration. Production will be on a big scale, hence periodic changes will be fewer. Facilities for observation of the merits of individual points in design will be greater; and the realization of possibilities for improvement will most always be ahead of production to a far greater degree than in an expensive small-volume product.

Contrast this with the \$5000-car class. Here service means a great deal more than the mere guarantee of usefulness. The equipment details and luxury of such a car call for more constant attention to the temperamental needs of the purchaser and the advice of the merchant or dealer. A more exacting demand for perfection in operation, colors, styles and numerous little things that less expensive cars rate as accessories are imminent at all times.

The executive of the Service Department occupied with such a car must be a "sales" engineer in every sense. Practical knowledge of the design, assembly, methods, repair and operation are the first essentials if such a man is to be looked upon as an authority in his line. That he must have executive ability and business acumen, together with a sound knowledge of the principles of marketing and distributing, both cars and repair

parts, goes without saying. To discuss these qualifications at a meeting of service managers is superfluous. But just now we are interested particularly in his relationship to the Engineering Department; hence it would seem that we should take time only to discuss the attributes necessary in order for him to accomplish the ideal relationship.

Given a man with the practical knowledge before mentioned, he must next have such a personality as to insure his being recognized as an authority within his own organization. This establishes confidence in his suggestions and advice regarding the product.

Now consider the second party—the engineer—with whom the service manager must collaborate. Such engineers are the least numerous of all the personnel in the automobile industry. Usually there is but one to every company—the few assistants attendant upon the engineer's duties counting for relatively little as far as actual design or changes are concerned. Engineers, by reason of their training and concentrated application to theory, are inclined to be temperamental; at least we are apt to think so. They are usually of a highly analytical nature and far more attentive to detail than the practical man. They have a disconcerting way of asking questions.

We must appreciate, however, that it is only through such minute analysis and consideration that real improvements are created; the absence of such a trait of character would exclude the engineer's right to his title. How many failures have come about through too much experimentation without analytical consideration, and a lack of application of first principles?

My criticism of the service manager is that he is usually either too intolerant of theory or impatient at not being understood. Often it is the problem itself rather than the man who expounds it that is not understood. This, therefore, develops into a plea for more fundamental knowledge and a more thorough presentation of practical experiences to the engineer on the part of the service manager.

To bring this about it will be necessary for him to actually "know" what he is talking about at all times. Present your engineer with a definite statement and a carefully considered recommendation. Don't take the other fellow's word for anything—prove it. Only by this method can you establish a confidence in your ability and knowledge.

Meetings of service managers from different localities—not too many men at a time—for the purpose of discussing definite features and for obtaining positive information should be encouraged. Let us not discount the importance of the ability of a practical man to keep cars running, despite owners' idiosyncrasies and inherent faults in design—for the latter always exist, say what you may and pay what you like. Such intercourse with the outside is good for the engineer; he will soon take an interest in your meetings when he discovers your purpose and the valuable, first-hand information to be gained. Don't be afraid that your engineer will learn too much of the practical side; that's impossible, because the very nature which made him elect to work with his head rather than his hands will place limitations upon him—unless he is one in a million.

Last, but not least, my advice is to make your contact a personal matter—the memorandum and the table of statistics attached is a cold way to confer on a subject of importance. Cultivate your man and don't be too formal; engineers are very human.

My plea to engineers is a small one—more tolerance for the man who has forgotten his text books

or who never saw them! Many times in my own experience I have seen a lecture in elementary mechanics, forcibly impressed, but delivered in a friendly way and in simple language, result in an agreement and harmony instead of an altercation and lack of respect for each other's ability. When the practical man and the theoretical man get together with the idea that each has the advantage over the

other, all progress stops. Intolerance has slowed up more than one organization.

Both engineer and service manager must be suited to the need of each individual organization. But in the latter one essential is paramount—as far as his relationship with engineering is concerned—the ability to hold his place as the recognized authority on what the public thinks of the excellence of his company's product.

## An Automotive Steam Engine

**A**N automotive steam engine, which is said to be practical for all kinds of automotive use, has recently been developed in Detroit. It is of the eight-cylinder, reciprocating type, weighs approximately 160 lb., and is said to develop 72.8 b.hp. It is 12 in. high, 15 in. long overall, and 11 in. long over the heads and cylinders.

The engine is novel in that it has no base, crankcase or crankshaft. Neither has it connecting rods or flywheel. It is assembled without packing or gaskets and there are only eight bolts in the entire engine. Not a single bolt or screw is connected with any moving part. It operates both forward and reverse at the same speeds, having only two rotating valves. Another feature of the engine is a one lever control, which starts and stops the engine, and handles all speeds forward and reverse as well as neutral.

The cylinders of this particular engine are of  $2\frac{1}{2}$  in. bore and the stroke is  $2\frac{1}{2}$  in., but the engine can be made in any desired size. Power for the pistons is transmitted to the driving shaft through a power ring similar to the wobbling plate and in some unconventional internal combustion engines as well as in some steam engines. The difference between this power ring and others lies in its flexible construction. It is actuated by trunnions which fit into the notches provided in the cylinders, which encircle the power ring. Each trunnion has a brass ball on its end, which works through slots in the cylinder wall. The ball is so attached to the ring that it can move in any direction through an arc of approximately 3 deg. Steam is admitted to the cylinders through the rotating valves at either end of the engine. The intake and exhaust are so arranged that two opposite cylinders are idle at any one moment, while the two groups of three cylinders between

them are working in opposite directions. By this means a balanced power output is secured and end thrust on the roller bearing on the shaft is said to be eliminated. The engine is double acting and, according to the inventor, is virtually two engines in one. It is possible to use one end for an air compressor and the other for a steam engine, if desired.

The engine is the result of development which started in April, 1917, by the inventor, E. U. G. Reagan, and is to be built by the Superior Steam Engine Co. Mr. Reagan claims that development work on the engine is about complete.

## Recent Aircraft Development in America

**‘‘W**HATEVER has been achieved in American aeronautics during the last year has been due rather more to individual vision and courage than to general support.” This is a statement from the opening chapter of “The Aircraft Yearbook, 1921,” recently made up by the Manufacturers’ Aircraft Association and published by Small, Maynard & Co.

This new review indicates the need for a more sound aircraft program in this country, together with a more general support of constructive efforts toward aircraft development. The various aircraft achievements of the last year are recorded and discussed, including commercial airplane development, aerial transport, mail aircraft, aerial forest patrol, marine uses of aircraft, aerial photography, aircraft in news gathering, and other similar features.

Reagan steam engine, assembled and partially dismantled

# Taking Advantage of Changing Conditions in Foreign Market

Ford is reported to have organized to cover rich agricultural and mining territories in Peru. Other American manufacturers have recognized the possibilities of the developing market in South America. Road development and use of cars for utility is materially aiding sales growth.

By George E. Quisenberry\*

A RECENT news note from Lima, Peru, reported that the Ford representative in that country had established branches and sub-agencies in a number of new cities and towns and that a dealer net was being organized to cover all the rich agricultural and mining territories of the Republic. The report further declared that Ford was apparently enlarging his dealer representation throughout other countries of Latin-America in an effort to take his cars, trucks and tractors into every section that offered any sales possibilities.

This brief notice may be interpreted as recording the opening of a new phase in the foreign sales of automotive equipment. A few years ago the American automobile was little known outside of the United States and particularly in those great territories of the various continents which had depended upon Europe for their automobiles and their automotive equipment. But the war stopped the European exports and the small automotive trade of these countries perforce sought the United States. This small trade was almost entirely a city business—the automobile was considered only as a pleasure vehicle, to be used solely by the rich and as a badge of the owner's social status.

The pioneer American exporters of automotive equipment had, of course, a different viewpoint. Theirs was a vision of the essential automobile, built and sold by production methods, and useful alike in the cities and the country districts. This thought took hold slowly and spread gradually, but the after-war demand prevented its realization to the fullest extent. So far as this is concerned, it may be said that sales were made during 1919 and most of 1920 without any rhyme or reason. It was a period of extravagant buying for every kind of product and one in which the normal course of development mattered little, either to the buyer or to the seller.

This period, of course, is definitely passed. Undoubtedly, it should be said, happily past and never to return. What we may look for in the future is an export trade built soundly upon essential needs and essential reasons, a trade that, when all is said and done, will be more satisfactory, more valuable, more permanent and of greater volume than any of the past. The country sections will be more closely covered, the automobile will be used for essential purposes and the motorization of all sections will develop fully.

This will be the second phase of automotive exporting. Some companies, notably Ford, already have seen it and are reaching out with all the ability and honesty that characterizes the best of American business. Many companies have not begun to sense it, while others perhaps never will. Those of the first category are going after this coming trade with all their resources—and they are

making shipments now to all parts of the world. The companies of the second class are awakening to the potential business and indicate that they are about to get back into the foreign field and go aggressively after business. The remainder, of course, are not worth worrying about, except as they will make sporadic sales from time to time, without providing service, that will reflect discredit upon the rest of the industry.

To go more into the proof. Although of a localized character, it may be taken to be general in its interpretation and will point out a condition that is becoming world-wide.

The proof refers to Chile. This southern Republic has been hard hit by the financial depression. Its currency has depreciated to an extent that causes the ordinary exporter to "quit cold." But, fortunately, all the exporters of American automotive equipment are not "ordinary"; many of them are tremendously alive and are carrying on with a vision that sees beyond conditions of the moment.

Chile held its first automobile show at Santiago, the capital, from May 20 to June 5. Although promoted by a private company, all makes of cars represented in Santiago were shown except a few, the agents of which are being changed. The exhibition was held in the center of the city, in a handsomely decorated building, and so successful was it that an annual show will be held hereafter, probably during the month of March.

The significant factor is this, which is quoted verbatim from the report sent from Santiago by the show committee:

"While statistical figures referring to imports show a considerable reduction in automotive products, based on our deep knowledge of the market, we can confidently state that this situation is only momentarily upset. We must remember that all automotive progress in Chile has been accomplished in spite of the lack of good roads. Just a few days before the formal opening of the show the Highway Law was passed. This calls for extensive road construction throughout the country.

"This will undoubtedly mark a new era for the motor car in Chile. The automobile which has been a vehicle of luxury and recreation will become an object of practical utility and of absolute necessity. The importance of the automobile is a fact that can be readily understood by considering the topographical conditions of our country. To this dominating factor we must add lack of sufficient rail transportation and continuous freight congestion. The automobile, we repeat, is a factor absolutely essential to our national life."

Apply that factor of absolute essentiality to all parts of Latin-America, to South Africa, to Australasia, to Asia, and to the other automotive markets, and the future cannot

\*Managing Editor, *El Automovile Americano*.

be misunderstood. The "new era" will not be confined to Chile, it is spreading into Argentina, Peru, Brazil, Colombia and Venezuela, Mexico, India, China, the Far East and every developing territory of the world.

More road building is under way to-day in China, it is reported, than for many years, and letters from personal friends in the treaty ports say traders and business men see unprecedented prosperity just around the corner. New highway activity that means the expenditure of thousands of pounds sterling has been commenced in New South Wales and other parts of the Australian group. Nearer home, the state of Sao Paulo, Brazil, is leading the way to highway betterment. To the fine road from Santos to the capital has been added an equally fine stretch of 110 kilometers in length from Sao Paulo to Campinas and work is progressing on the highway from Sao Paulo to Itu, something more than 150 kilometers. These are all macadam highways and the review does not consider other inland roads which are reported to be in good shape, notably from the capital to Ribeirao Preto, a distance of 440 kilometers. "At the present time our Government is displaying unusual activity in road work," a dealer from Sao Paulo writes.

Venezuela has undertaken a program of highway building that is showing more results than is generally accredited. Panama, for instance, has just let new road contracts totalling \$270,000, the third project to be under-

taken this year, all the work of which is in the territory of the Republic and none of which is in the Canal Zone. The city of Santo Domingo, in the Dominican Republic, has decided to seek a loan of \$500,000 for public work, much of which will be for paving the principal streets. The activities in Mexico are better known and roads are being constructed in Cuba despite the present difficulties. Argentina, likewise, is displaying more activity than in previous years and a goodly number of long distance automobile tours and races, together with increased utility of the automobile, has this year added to the consciousness of road necessity.

Automotive exporters, in common with those of other lines, feel more optimism to-day than they have since the readjustment began. With Hoover they believe the corner has been turned and the future will witness a gradual but none the less certain restoration of normal business that will be re-enforced greatly by the growing understanding of the essentiality and utility of the automobile.

Ford is getting in on the ground floor in Peru. His foreign department apparently is going after the rural trade. It has realized that there are other cities and towns in each of the foreign territories than the capital or the chief port. A man does not have to live in Lima to own an automobile; he can use it just as well in Trujillo, Ica, Chincha or any of the other towns that dot the rich agricultural and mining areas.

## Home-Made Fuel for South Africa

THE production of a home-made fuel for automotive vehicles is contemplated in South Africa, according to reports from Trade Commissioner Stevenson of Johannesburg to the Bureau of Foreign and Domestic Commerce. The new fuel, which has been patented in the Union under the name of Penrol, will be made principally of alcohol, which will be produced from locally grown maize or corn. A company is being formed to produce and market the fuel and it is claimed that all ingredients can be produced locally. The selling price is to be considerably less than that of gasoline; it has no smell and it does not carbonize, although it is claimed to be equal to gasoline in power. The report declares that it has been subjected to experiments for a considerable period in passenger cars, motorcycles, trucks and airplanes with excellent results. The gasoline consumption of the Union is estimated at 12,000,000 gal. annually.

### Suggestions for British Trade

A writer in the (weekly) Trade Supplement of the London Times makes a notable admission regarding the strong position of American cars in markets which, he, in common with other writers in British organs, regards as eminently suited for British interests, or, in many cases, as though Great Britain had some special and prescriptive right to them.

This later view of the situation is largely traceable to the no longer applicable saying that "Trade follows the Flag," for from a variety of circumstances it is not true to argue that the colonizing influence extends far beyond the immediate purview of the first in-comers.

However, here are a few excerpts from the writer's fair statement of the case through the Times: "It must be remembered that the American vehicle has obtained a firm footing and standardized opinion as to the capacity of a car. Where there are, say 30 American cars to one British, it would be wrong to assume that local opinion is that American cars are cheap and powerful. The opinion is that British cars are far too dear, have

too much finish, and require too much "driving"—i.e., gear-changing—for local conditions.

"There is a little doubt that the British Empire would supply a valuable market for British engineers, if they are willing to design a special overseas model.

"The technical requirements are strikingly simple and almost universal for overseas markets. The track should be the standard, viz.: 4 ft. 8 in. The clearance should be never less than 10 in., and more in the case of cars of long wheelbase. The cars should be capable of good top-gear performance, and this means a large engine and low gearing.

"The finish should be sufficient and not excessive. That means that imitation leather should not be used, but that less varnish than usual is an advantage. As to body work, the Empire is preparing to look after itself in the matter and exporters to Australia and Canada are well advised not to undertake the risk and cost of supplying British bodies unless specially required."

### Tractors in South Africa

The British Trade Commissioner at Cape Town has sent a report on the working of farm tractors in South Africa, which incidentally gives some useful hints.

High altitudes affect adversely the power output of internal combustion engined tractors by as much as 10 per cent at 4000 ft. Engines, therefore, must have a fair surplus of power for the stipulated load; must be sturdy and their shaft-speed should not exceed 600 r.p.m. and certainly not more than 1000 r.p.m.

Tractors and tractor ploughs must be capable of tackling land ploughed ordinarily by local oxen. Such land is hard after a drought, becomes dusty and little of it is easily broken.

Skilled labor for tractors and tractor implements is not usually available.

A cheap lubricant is essential.

Generally the tractor required must be as near fool-proof as possible.

# Weights of 1921 Cars on Which Kansas Bases License Fee

Comparison of sedan and touring car shows that for 75 makes the average excess of the closed car is 362 pounds, the maximum difference being 655 and the lowest 200 pounds. Heaviest car in this record was a 1914 model brougham, weight 6200. Ford the lightest car listed.

**H**OW much should the weight of a sedan exceed that of a touring car? This and other interesting questions regarding the weight of the various makes and styles of automobiles have frequently been asked, but answers were impractical because weight data has been almost impossible to obtain.

Beginning in July, automobile licenses in Kansas are based on weight. The Secretary of State, upon whom the enforcement of the law was placed, asked all factories to supply him with the shipping weight of all styles of cars. In some cases this information was not supplied to him. His procedure in these cases was to weigh a car of the make and style desired when it was presented for licenses, and to deduct 100 lb. as an allowance for fuel, oil and extra equipment. This compilation of weights has been printed as a guide for those concerned with the issuance of licenses.

A study of this list is interesting. In the main, the weights increased slightly from 1912 to 1914, but since that year there has been a tendency to lighter cars. There are exceptions, of course, but chiefly the exceptions represent an increased number of cylinders and a larger car generally. In some cases the greater number of cylinders and increased wheelbase appears to have been accomplished without material increase in weight.

The heaviest car in this record is a brougham built in 1914, which weighed 6200 lb. The lightest car is the most numerous one.

It is quite interesting to note the difference of weight between the various styles of cars of the same make for 1921. The lowest added weight over the touring car for a sedan is 200 lb. The greatest is 655. The average of 75 makes of cars is 362 lb. The following weights for 1921 cars is taken from the Kansas compilation:

## A New Cushion Wheel

THE cast metal wheel shown in the accompanying cut has recently been announced by a manufacturer who has for some years made a similar type of wheel without the cushion feature incorporated in the new product. The cushion consists of rubber with air pockets and is placed between the felloe band and a second metal band on which the solid tire base is mounted in the usual manner. The wheel consists of four parts—the hollow spoked wheel, rubber cushion, steel locking ring, for locking the rubber cushion in place, and the retaining rim outside the cushion. The air spaces are interconnected with channels which permit air to circulate in the periphery of the wheel and thus convey heat generated to the metal from which it is radiated. The cushion wheel differs but little in appearance from other cast spoke wheels made by the same concern, Smith Wheel, Inc. The makers state that the design is such that the tires cannot be forced off by hitting an obstruction. Depressions in the cushion retaining rim prevent creeping of the cushion around the wheel. It is said that the wheel requires no attention until the tires are entirely worn out.

Sectional views of Smith cushion wheel

## Consolidation in Trailer Industry

Editor, AUTOMOTIVE INDUSTRIES:

Development of the trailer industry is now, and has been for several years, a sales problem. Mechanically the trailer is simple as compared with the motor truck, and the major engineering and manufacturing problems have been overcome. It will succeed in time, but the process is slow and made doubly hard by the present waiting attitude of industry and commerce for the anticipated turn in business conditions.

The industry has manufacturing facilities greatly in excess of present demands for its product and of probable sales possibilities for a year or two to come. Sales have doubled and tripled from year to year, but the increase has been more than equalled by additions to the number of manufacturers and increased productive facilities. Profitable operation of the plants therefore waits on larger sales.

This would be problem enough of itself under present conditions, but it is magnified by the fact that salability of the product is affected by manufacturing costs and the almost impossible necessity of getting the list prices down to a reasonable conformity with reduced truck prices. The prospective purchaser of a trailer mistakenly looks upon it as a mere assembly of truck frame, axles, springs, wheels and body, and feels that a price ranging from a third to one-half that of a truck of equal capacity is entirely too high. At the same time the trailer distributor and dealer take little interest in pushing the sale of trailers on an equal commission or discount basis with trucks, which are more easily sold and represent two or three times as much profit. Reduced prices of parts and materials and a lower wage scale will permit of some lowering of trailer prices, but the apparent disparity of list with truck prices will remain, as well as the problem of effective inducement to the distribution agencies.

High manufacturing costs are due primarily to the inability to get into quantity production. This is brought about by

1. Low volume of sales.
2. Division of sales among too many manufacturers.
3. Multiplicity of types, sizes and models.
4. Production of special designs to meet customers' wants.
5. Unsystematic operation of plants.

Most, if not all, of these faults are inherent in any new industry, and were very pronounced in the earlier years of the truck business before design came to be fully standardized and such variants as two and three cylinder engines, two-cycle and air-cooled engines, horizontal engines, friction and rope drive and other troublesome and inefficient designs were eliminated. Manufacturing cannot, of course, be on an economical basis until parts can be produced continuously in large numbers and assembled into the final unit in a systematic, progressive way that eliminates lost motion. Probably no better example of the advantages of this method exists than the manufacture of Ford cars, in which the concentration of all efforts on a single model permitted the fixing of a retail price that

led to a succession of increased annual sales followed by further price reductions. On one side of a certain but indeterminate line is the vicious circle of low volume and high cost, which react adversely on each other, and on the other side large volume and low cost, which affect each other favorably and lead to success. How to bridge the gap from one condition to the other is the problem that has wrecked innumerable manufacturing enterprises.

The most practical way of making this possible, in the opinion of the writer, is by a consolidation of the largest and best equipped companies now in the industry. There is no insurmountable difficulty in the way of accomplishing this; in fact, the possibility and advantages of such a consolidation are realized by leading trailer makers. A competent organizer from outside the industry, who could command or interest sufficient working capital, not necessarily very large, could put the deal across if he had a practical plan and was able to enlist the confidence of the industry.

Without attempting to outline such a plan here, it may be pointed out that about half a dozen of the most modern and best equipped plants now in operation have potential capacity to produce all the trailers likely to be sold during the next two or three years. Each plant, instead of manufacturing three or four types and as many sizes in each type, constituting a line of from one to two dozen models, could and should be confined to from four to six models, preferably of one type. For example, one factory should specialize in four-wheel models, another in semi trailers, another on pole trailers and a fourth on two-wheel balanced trailers. Or, the division could be made along the line of heavy-duty and light-duty models, in which standard parts and fittings would interchange to a considerable extent.

It is imperative that the total number of models should be reduced to the minimum consistent with good business policy and that these be standardized as to units. Many special parts of identical form and dimensions, as well as bolts, nuts, etc., can be used in several types of trailers and also in several sizes of the same type, since some oversize of these in the lighter models is not detrimental. This will reduce the number of drawings, patterns, molds, jigs, etc.

It is maintained by some of the manufacturers that trailers have not yet been developed to the point where standardization is practical; however, by selecting the best designs of all the companies that would be embraced in an amalgamation, very satisfactory and commercially salable models would result that would warrant standardization. One of the smaller plants could be maintained as an experimental shop for development of new patents and designs. This would avoid interruption of systematic production in the other factories.

Sales records of all the plants taken into the consolidation could be assembled, compared and studied to determine the trend of demand for different types and sizes and those eliminated for which there was relatively little sale and which were unprofitable. The reduction of models and standardization of those retained would increase the volume of each to be produced and greatly re-

duce the stocks of materials and parts to be carried by the factories and by the service departments of distributors and dealers. Much capital now tied up in such stocks would be released. Furthermore, adoption of standard dimensions of frames and axles would enable the frame and axle manufacturers to produce desired special designs for trailers and offer them to the trade at prices fairly comparable with such parts for trucks, whereas now the orders of individual trailer companies for any particular size and pattern are too small to justify the making of special forms for presses and forges.

The chief advantage accruing from a consolidation would be the pooling in one plant of all orders for a given type and sizes of trailers now divided among all the factories, with a resulting increase in volume that would permit continuous production in large lots, more extensive utilization of labor-saving machinery and progressive assembly.

A secondary advantage would be the possibility of eliminating much of the selling expense by consolidating or reducing the number of selling agencies in the different cities throughout the country and by reducing the percentage of advertising cost per trailer sold. It would be poor policy to curtail the aggregate advertising appropriation, as perhaps above everything else the trailer needs advertising and publicity, but the expenditures would be concentrated on fewer makes and models and as sales increased the cost per trailer would be less.

It would be desirable in a combination such as suggested to take in as many existing companies as possible whose product or whose business condition made their acquisition desirable. Stockholders in many of these companies would almost certainly be willing to exchange their holdings for an equivalent in stock of the new corporation. Others might have to be bought outright. The more companies taken in, the more competition would be eliminated and the more useful patents, sales data, goodwill, etc., would be acquired. It would be found advisable if, say, a dozen companies were embraced in the consolidation, to close about half of them, removing to the larger and better equipped factories such machinery and stock as could be utilized to advantage and disposing of the remainder, together with the land and buildings of the less efficient plants that were closed.

If assembling and sales plants were maintained in or near New York, at San Francisco, in the Middle West and at a Gulf port, large savings in freight could be effected on both domestic and foreign sales.

The present money market cannot be said to be favorable to launching such a consolidation, but there are so many strong arguments in favor of the trailer as an economical transportation medium that the favorable attention of capitalists and bankers can be obtained.

The personal factor must be taken into consideration in connection with the practicability of a trailer consolidation. Each company naturally believes it has the best designs and hopes to be among the successful survivors in the industry. All will admit, however, that industrial history indicates that not all will survive and that any one of them may be among the number that do not. They will also admit that efforts to reach voluntary agreements on standardization, reduction of models, exchange of patent rights, interchange of manufacturing and sales data, and pool advertising—all calculated to reduce manufacturing cost, increase sales and get the industry on a systematic, quantity production basis—have so far been ineffective and disappointing in their results. In normal times the trade might await the slow development of voluntary co-operation to bring these things about, but prevailing business conditions make such a delay unwise. Consolidation would make it possible to enforce economies

in manufacture and selling that would place the industry on a firm foundation ready to raise a towering and safe superstructure as rapidly as the business revival develops.

H. W. PERRY.

## Battery Life

Editor, AUTOMOTIVE INDUSTRIES:

I note in your issue of July 21 a reference to the probable basic reason for failures of storage batteries as supplied for starting, lighting and ignition.

At the outset, let me say that I write not only from the viewpoint of one who has used and sold, but who has built and installed storage batteries for sixteen and one-half years.

In the first place, the automobile manufacturer is responsible for the "eight to fourteen months" batteries now usually supplied, his instructions to his purchasing agent being: "Watch price and capacity." In the days when starting and lighting batteries were being developed, the lowest price, the greatest capacity that could be crowded into a limited space, and minimum weight, were the factors in demand. Battery manufacturers met the requirements by thinning down the plates and increasing the number. This results in high capacity, light weight, a short lived battery and one not able to resist the abuse it is subjected to; hence the inevitable result is warped or buckled plates, internal short circuits, heating up upon charge and rapid disintegration; and, finally, a new battery and a dissatisfied customer.

Also, there is a feverish desire on the part of some battery manufacturers to have their battery standard equipment. Price being the goal of the purchasing agent, cheaper production by the battery manufacturers, and sales at little or no profit, a speedy renewal or new battery bought by the consumer and at a profit covering the virtual loss sustained when original was sold.

I can recall when I was in competition with other manufacturers and upon submitting my price was informed that it was 50 per cent too high; that it would cost the automobile manufacturer for his entire equipment \$250,000 more if my battery was bought; but I am satisfied that \$2,500,000 would have been saved the consumer.

AUTOMOTIVE INDUSTRIES is partly right in stating that the \$40 battery to the consumer would not have cost the automobile manufacturer \$10 additional had he demanded a battery that would have lasted the consumer 2½ to 3 years.

To illustrate, I was asked by a certain purchasing agent to fix up his battery (starting and lighting) that had been in a popular car about three years. Knowing the battery very well, I advised looking into the cells, and upon examination found the plates in excellent condition but slightly buckled. The plates were straightened and new wood separators put in, and the last I heard of the battery it was four and a half years old. That battery did not cost the consumer \$40, but it was sold to the automobile manufacturer at a fair price and all the profit was not received from the consumer.

If the automobile manufacturer desires, he can demand and will receive a battery that will last 2½ or 3 years under ordinary circumstances, but he will have to pay a reasonable price for same, and probably leave a little more space and carry a little more weight, but it will give the service. And if the automobile manufacturer would pay a fair price, the battery manufacturer would not be compelled to get all his profit out of the car user, nor would the owner be compelled to pay \$40 for a new one at the end of three years. But even if he did, \$40 less the allowance for the old one extended over three years is reasonable.

## Accessibility and Maintenance Cost

**H**OW much is it necessary to sacrifice in accessibility to attain low cost in the production of automotive vehicles? Very little, we believe, if sufficient study is given to maintenance and repair problems when laying down the design.

It is of great importance, of course, to study production problems if the first cost of any piece of apparatus is to be minimized, and this is more apt to be given consideration than the cost of maintenance for the reason that the designer is usually in closer touch with production than with the maintenance problems.

It must not be forgotten, however, that most purchasers of cars, trucks and other automotive equipment have already had experience with the same general type of vehicle they are buying, and that such purchasers usually know very well that the cost of maintenance is nearly or quite as important as first cost. For this, if for no other reason, factors controlling maintenance and operating cost should

be given much closer attention than heretofore.

Some chief engineers make it a point to get the benefit of criticism of service engineering in various local branches before deciding finally upon a new design. It is a good practice and one which could be profitably followed in all cases. Whether this is done or not no design should be put into production until it has been given careful consideration from the standpoint of accessibility and serviceability under average conditions of use.

## Necessities, Not Luxuries

**I**T still seems necessary to occasionally point out that the automobile of to-day is a necessity and not in any sense a luxury. There are, of course, a small percentage of cars operated largely for pleasure by wealthy owners, which may fall in the luxury class, but even these are used more as a means of transportation than to give pleasure to the owner.

If any legislator doubts that cars are to be classed as utilities let him, for example, make a trip into any small town (more than half of our cars are used in towns of under 5000), and observe how and why cars are used for nearly all road travel in preference to horse-drawn vehicles. We recently had occasion to observe conditions in a New York town of about 500 inhabitants which is typical of thousands of towns in the East. Nearly every family had its automobile and could not do without it. The car carried milk to the creamery; it fetched cattle feed from the nearest railroad town 8 miles distant; it transported farm hands; it carried children to larger and better schools—to mention only a few uses. We were informed that less than a half dozen natives paid an income tax, yet men who should know better assert that an automobile is a luxury which no one with an income of less than \$2000 per year can afford to own!

The saving in time alone made possible by the use of a car often more than pays for it in the case of many owners.

A year ago some wiseheads predicted that the use of the automobile in common with other "luxuries" would be greatly curtailed during the current financial stringency, yet more gasoline was consumed in this country during the first six months of this year than during any previous six month period. Luxuries which are such in truth have been curtailed, but the automobile has long since become a utility of the first order, a necessity in our modern scheme of civilization. As such it can justly be taxed only as other necessities are taxed and in particular only as other means of transportation are taxed.

## Sound Future Development

**T**HE stability of the automotive industry and the sound basis present for its future development has been attested by every intelligent examination of authentic statistics. It is natural at a time like this that many persons will endeavor to predicate future trends on the basis of past statistics. This is an excellent tendency, despite its dangerous features, since

it indicates a desire to analyze the true facts of the situation and base future plans on sound data.

Among recent discussions along this line, the estimate recently made by C. A. Dana, president of the Parish Manufacturing Corp., is of interest. This executive estimates that there is a replacement market for 1,800,000 vehicles yearly on the basis of the present registration. This estimate indicates that there is a market for 83 per cent of the enormous 1920 production, even though no new buyers were developed. In discussing this estimate, Mr. Dana takes the sound view that we can look confidently to the future.

The best available statistics indicate a healthy growth for the industry. This growth, however, must be accelerated by careful analysis of markets and by intensive study of merchandising factors.

## Internal Combustion Turbines

EVER since the movement toward higher fuel economy in automotive engines started, a certain amount of interest has been shown in the internal combustion turbine, as possibly a more efficient engine than the Otto cycle piston engine. The hopes attached to the internal combustion turbine in this connection are undoubtedly based on the great economies effected by the use of steam turbines as compared with reciprocating steam engines. According to recent figures, the best efficiency obtained from reciprocating steam engines is in the neighborhood of 15 per cent, whereas large multi-expansion steam turbines give as high an efficiency as 28 per cent. That a similar improvement in results cannot be expected from the gasoline turbine is fairly obvious when we consider the difference in the conditions. In the case of steam we have in the boiler a fluid under pressure which can be supplied directly to the turbine, thus doing away completely with reciprocating machinery. In the case of internal combustion apparatus, on the other hand, the working fluid must be compressed and exploded before it can be fed to the turbine, and thus the reciprocating machinery cannot easily be done away with.

Another difficulty with the internal combustion turbine is due to the high pressures and corresponding high gas velocities which must be employed. It is a fundamental rule of turbine design that for maximum efficiency the blade speed must be one-half the speed at which the working fluid issues from the nozzles. In internal combustion turbines it is difficult to attain the desired speed because the high temperature of the gases greatly reduces the strength of the blade material.

A very thorough research of the work that has been done on internal combustion turbines to date and on the possibilities which the turbine holds out for aircraft applications has recently been published by the (British) Aeronautical Research Committee (Engine Sub-Committee Report No. 54, *The Internal Combustion Turbine*, by W. J. Stern). The conclusion is reached that the internal combustion cycle cannot be utilized in a turbine powerplant without large losses. These losses are largely of a mechanical nature and take place in the compressor and in the

turbine proper. Owing to the limitations of peripheral speed by the state of the metallurgical art, either very lean mixtures must be used or else water injection resorted to, both of which practices are thermodynamically wasteful. It is shown that the best thermal efficiency which can be expected from a turbine of large capacity and fitted with a regenerator is 20 per cent, which compares with 28 per cent of present large aircraft piston engines.

Looking at the subject from the standpoint of other branches of the automotive industry besides that of aircraft, there are other objections to the turbine besides low thermal efficiency. To judge by the various designs which have been worked out so far, very little flexibility can be expected from this type of prime mover, which is in reality a one speed machine. The high speed of revolution required for a fair thermal efficiency necessitates a very great gear reduction, which would involve additional losses of considerable importance, and undoubtedly appreciable noise as the gears became worn.

## Standards of Performance

GREAT benefits have accrued from the establishment of standards of performance, but untold difficulties have also arisen from the attempt to judge performance on the basis of inaccurate standards. Extreme care is always necessary in establishing a standard, for if it be set up as a measure of performance without being correct, it must of necessity warp the view of all the subsequent performances which are measured by it.

One important branch of merchandising seems to be afflicted by false standards. The true function and purpose of the publicity department of the automobile manufacturer has not been well understood.

In many cases it seems to be the policy of the management to judge the performance of their publicity man by the number of lines of "free publicity" he obtains, regardless of the quality of the material printed or the effectiveness of the mediums in which it appears.

In one case, for example, the management of a large company receives monthly reports from one of its publicity agents stationed in a city at a considerable distance from the home office. This report indicates the number of lines of publicity that have been obtained during the last month. When the number of lines shown in this report runs low, the publicity man is in for a "calling down." His natural reaction is to get more lines, regardless of how or where, since he is judged solely on that basis. Consequently he makes friends with the local newspaper men in the town in which he is located—a town comprising a small part of his territory. Through this relationship he puts over large quantities of publicity in these local papers, some of it good, some of it bad; all of it very limited in scope and effectiveness. But he is judged only by the quantity standard and gets praise for the number of lines.

A large part of the difficulty will be overcome when those in command fully recognize this fact, and set up sound standards of performance for publicity men.

# Sales Outlook Improves Steadily

## August Production Well Up with July

Better General Conditions Apparent—Farmers Coming Into Market

By JAMES C. DALTON

NEW YORK, Aug. 15—As the summer progresses the outlook for the automotive industry becomes increasingly encouraging. This applies not only to present but to future business. Manufacturers are not finding it necessary to curtail production schedules as sharply as had been expected and a considerable number of them have not reduced their output from the July schedules. Several companies are not able to keep pace with orders and their dealers are considerably behind on deliveries. Where it is not possible to meet the calls of all dealers, those coming from the agricultural districts, which were flat for many months, are met first.

It has become apparent that there is no dearth of purchasing power for automobiles either in the United States or other countries. The response which followed price reductions has amazed car manufacturers. They expected some stimulus to business, but nothing like what has followed. This is the reason why some of the more popular lines are behind in deliveries. They underestimated demand.

The effect of price reductions has been equally significant in England, which was much harder hit than the United States by post-war depression. One great American company which had its English warehouses filled with cars began to liquidate its stocks as soon as the prices were cut, and so heavy has been the demand in the short period which has intervened that new shipments are actually being made.

Reports from various parts of the United States are that August automobile sales promise to equal or eclipse those of July. A prediction to this effect would have been considered chimerical a month ago. Business is distinctly better in the agricultural sections and in the South. Crops are being harvested and the price of cotton has advanced. This promises well for the months to come when the harvest is completed.

It is known that reports received by the General Motors Corp. for the first week of August indicate that business for this month will exceed that of July. With cars in various price classes, this condition can be considered fairly representative of the industry. It is true of Dodge, Studebaker, Reo, Hupp and Ford. In fact, steady gains in employment are

being made in Detroit. For the week ended Aug. 2 the manufacturers there employed 1231 more men than the week before. Men are being taken on not only in the car factories but in the parts plants.

Five Cleveland companies—White, Chandler, Cleveland, Jordan and Templar—report larger production schedules. Winton, Peerless, Stearns and Grant state that their output is being maintained at the rate reached in June and July. White is selling more trucks than it is making.

Not only are car manufacturers finding August business beyond their expectations, but there are gratifying signs of life in the truck industry. With the general improvement in business and the consequent increase in freight movements there has been a substantial increase in truck orders, although they still are far below normal. Truck sales will move upward only as the general movement of goods expands in volume. As the need for motor transport increases, sales of new commercial vehicles probably will be retarded until the stocks of American-made trucks reimported from England and France are liquidated, but the number of such vehicles is not large enough to last long once business reaches anything like normal proportions. By that time it is probable congressional action will have curbed reimportations.

Close observers of conditions are more firmly convinced than ever that the truck industry really is in its infancy and that its expansion in the next few years will parallel that of passenger car development in the past decade. In spite of depression, there has been a surprising development in motor freight and passenger lines. In the passenger carrying end of this business the United States is lagging far behind Europe.

With the production of motor vehicles holding up surprisingly well, parts makers are beginning to feel the reflex, and the prospect for fall business is much brighter than it was two months or even a month ago. This is especially true of makers of unit parts. Probably the most encouraging feature of the situation is that both car makers and parts manufacturers have made very heavy reductions in the enormous inventories they had on hand when the slump came last year. This will necessitate soon a larger volume of orders from the vehicle factories and will send the parts companies into the market for materials.

Another trend of the industry which is arousing much interest and speculation is the demand for inclosed bodies. Indications now are that most companies will be flooded with orders for inclosed models in the next few months.

(Continued on page 342)

## Parts Sales Hold Up in Passenger Lines

Few Orders Booked from Truck Plants—Increases Expected in Fall

DETROIT, Aug. 15—Business with parts makers in the Detroit district is good or bad according to their degree of dependency on the truck industry. Those parts makers doing most of their business with passenger car makers find conditions holding up well; those relying chiefly upon truck orders for a large per cent of their activity are working along on a 50 per cent basis, some a little more, some less.

Truck parts makers do not look for real improvement in conditions until spring, though they expect a better business in the fall months due to farmer buying. Real improvement cannot come until industrial companies start using their trucks again, the parts makers citing their own cases to show that they are using only few trucks of their own fleets.

In the passenger car field business has been at a satisfactory if not normal capacity for the past three months. This same ratio is being maintained to-day and is expected to continue. Further than this it is impossible to forecast accurately owing to the prevailing tendency to hold orders to a thirty-day basis.

Practically all business now being done by parts makers is on the thirty-day basis. Though this has had a tendency to keep operations uncertain, it has resulted in a large amount of business being done and many standing orders have been greatly reduced, making certain a large amount of re-ordering soon to follow.

In quite a number of instances new orders are already being placed and many companies report inquiries which seem bound to develop new business. One condition which stands out prominently in the statements of parts makers, and which is the cause of genuine optimism, is that there are very few cancellations.

(Continued on page 340)

## STEPHENS FORCE NOW 400

FREEMONT, ILL., Aug. 16—July was the best month in the last 10 months, according to H. J. Leonard, general manager of the Stephens Motor Works, and prospects are that the August production will be 50 per cent greater than the July output. Four hundred men are on the payroll now and there are approximately 100 carloads of machines in advance of the present stock.

# Graham Bill Passes in the House

## Measure Important to Truck Industry

Reimports Legislation Said to Be Looked Upon Favorably by Senate

WASHINGTON, Aug. 15—From the viewpoint of motor truck manufacturers and dealers, the most important legislation acted upon in Congress since the war was the passage by the House by a vote of 186 to 83 of the joint resolution introduced by Representative Graham of Illinois which would impose an ad valorem duty of 90 per cent on all goods sent to France and England from the United States during the war and reimported for sale in this country.

Every effort will be made to get favorable action on the resolution in the Senate before recess is taken for the remainder of the summer. Senate leaders already have expressed themselves favorably on the measure.

While the resolution is not aimed specifically at reimportation of motor trucks, it will effectually end the unfair competition to which American makers and dealers have been subjected for the last six months. Sales, at practically half the list price, of reconditioned trucks which are new to all intents and purposes have made it difficult to find buyers for vehicles of the same type freshly made in this country.

### Sale Is Nation-wide

The Truck Company of America with headquarters in New York has gone into the sale of these trucks on a national basis and is appointing dealers in the larger cities as well as guaranteeing a supply of parts. This company alone is understood to have on hand approximately 2000 of these vehicles. Most of them were purchased from the Slough Trading Co., an English corporation formed to buy up surplus trucks from the British government.

The first of these trucks were placed on sale in Los Angeles and they are now to be found all along the Eastern seaboard. All of them are of standard make and in good condition. The average price paid for the trucks by the Truck Company of America is understood to have been \$1,000 and the company expects to make 100 per cent profit on each sale.

A considerable number of trucks of a similar character have been sent into the country from France and there is an enormous quantity of American made automotive equipment in that country which speculators have expected to sell in this country.

Early passage of the Graham resolution by the Senate would put an end to

**TRAILERS ARE VEHICLES, SAYS RULING, SO MUST CARRY LICENSES**

COLUMBUS, OHIO, Aug. 17—According to an opinion rendered by Attorney General John G. Price, trailers are classed as motor vehicles in the meaning of the registration law and must be provided with license tags in front and behind. This ruling was called forth because of the practice of some trailer owners of using but one tag on a trailer or none at all.

duty free reimportation of these supplies and imposition of a 90 per cent ad valorem duty would put them in a price class where established dealers could compete successfully for the business which will follow the gradual restoration of normal business conditions.

A clause inserted in the permanent tariff bill by Chairman Fordney of the House Ways and Means Committee was designed to cover the reimportation evil but with the passage of the tariff bill indefinitely delayed, the Graham measure will meet the situation much more effectively. Its passage by the House brings to a climax a long and sometimes discouraging fight made by some of the elements within the automotive industry.

### Scope Not Realized

For weeks after the first of the Slough trucks appeared on the Pacific coast, few persons within the industry seemed to sense the possibilities of this competition once truck sales again approached normal, but pressure finally was brought to bear upon Congress and leaders in both Houses began to see the seriousness of the situation.

The Graham resolution would cover vast quantities of war supplies of all kinds. The United States Liquidation Commission informed the House that this accumulation of materials was sold to France, England, Poland, Belgium and other countries for \$822,923,000. The original cost was \$1,739,189,302. Much of it was purchased by the governments themselves and later sold to speculators.

The bill will become effective as soon as it is signed by the President.

### STANWOOD PLANS TO GO ON

ELIZABETH, N. J., Aug. 16—Plans are being developed for the reorganization of the Stanwood Rubber Co., which now is being operated under a receivership. Although the plant has been placed on the market, it is understood that arrangements will be made for a resumption of business.

## Cameron Takes Over Greenville Factory

Implement Plant Will Be Used for Making Castings for Motors

NEW YORK, Aug. 15—Cameron Motors Corp. has taken over from Cass T. Wright the plant of the Greenville Implement Co. at Greenville, Mich., which will be used for the manufacture of castings for its motors and tractors. Cameron Motors recently acquired the plant at Sandusky, Ohio, of the Dauch Mfg. Co., making the Sandusky tractor.

Greenville is only about 200 miles from Sandusky and both towns are on the same railroad line, which will make the movement of castings convenient. The present capacity of the foundry at Greenville is 50 tons of castings daily and this output can be increased to 100 tons. Plans already have been prepared for an addition 80 by 150 feet. In addition to foundry work, Cameron Motors will use its new plant to make plows and other special equipment for the Sandusky tractor.

The consideration for the Greenville property is understood to have been about \$150,000. Charles A. Nevins, formerly of St. Johns, N. B., will be the engineer in charge of production at Greenville.

Cameron Motors has begun operations at the Sandusky factory and expects satisfactory business in the fall.

## Fisk Rubber Operating at 90 Per Cent Capacity

SPRINGFIELD, MASS., Aug. 18—With a production of nearly 10,000 casings and 13,000 tubes daily, the Fisk Rubber Co. is operating its Chicopee Falls plant at 90 per cent of its peak capacity, officials announce. At the bottom of the winter depression it was down close to a 30 per cent basis. The August production schedule upon which the factory is now working calls for 225,000 tires, an increase of 32 per cent over the July output of 170,000 tires, which, in turn, represented an increase of nearly 50 per cent over June. The May output was but 65,000 tires.

Every month since May has shown a sales increase over the previous month for Fisk. Not only that, but the last three months have been ahead of the same period in 1920.

Fisk is rapidly working off its high-priced inventory and on the readjusted basis of 20 cents per pound for crude rubber, it is predicted, ought soon to show some net profits.

## Japanese Motor Tax Hurts Orient Sales

**Business Confined Almost Entirely to 4-Cylinder Cars—See Complete Halt**

SEATTLE, Aug. 18—Until the excessive automobile taxes were initiated in April, six cylinder cars were the most popular type of passenger cars in use in Japan, while since April buying has been confined almost entirely to the four-cylinder, low horsepower cars, according to the latest information received here from the Orient. It is declared among motor dealers in Japan that there is no doubt but that the change has been brought about by the new taxes. Several of the largest importers of automobiles in Tokio report that they have sold no sixes since April.

The motor car dealers in Japan explain the attitude of the buyer as follows: A man may be willing to give eight thousand yen (\$4,000) for a motor car, provided that he believes this to be a fair price, but he will certainly strongly object to paying 850 yen (\$425) per year for the privilege of owning a motor car. Moreover, this tax does not depreciate with the value of the car, but continues at the same figure. Thus in three or four years, the tax is almost equal to the second hand value of the car, it is pointed out.

### 5000 Cars in Tokio

There are about 5000 motor cars in Tokio, a city of about 2,250,000 population. Tokio has fewer automobiles in proportion to its population than any other of the world's larger cities. Under ordinary conditions, an increase in the number of cars might be expected, but at present the number of cars is decreasing. It is feared that it will further decrease after the time when the first of the semi-annual tax payments is due, and motorists generally realize that the municipal authorities are in earnest about the tax.

Inasmuch as the vast proportion of the automobiles in use in Japan are of American manufacture, the feeling is growing among automobile importers in the country that American manufacturers, either individually or collectively, should launch an extensive campaign in that country to "sell" the general value of the motor car, as they are doing in the United States. Unless such a campaign is undertaken soon, it is believed that the movement of cars in Japan will be tremendously injured, if not halted.

### EDDIE HEARN WINS RACE

SANTA ROSA, CAL., Aug. 15—Eddie Hearn, driving a Duesenberg-Distil car, won the 150 mile automobile race which opened the Cotati Speedway here yesterday. His time was 1 hour, 21 minutes, 19.5 seconds. Roscoe Saries in a Duesenberg was second and Tommy Milton in a Durant Special was third.

### "OLD DOBBIN" FORMS BUT 1% OF TRAFFIC ON RURAL ROAD IN IOWA

WATERLOO, IOWA, Aug. 17—A count was kept of the traffic over Rainbow Drive, the paved road from this city to Cedar Falls for seven days from 6 a.m. to 9 p.m. and the number of vehicles was 14,032. It was estimated about 7000 passed over the drive later than 9 p.m., bringing the total to more than 20,000 for the week. The observations were made by Macy Campbell of the Iowa State Teachers College. He was assisted by members of his family in making the actual count. Ninety-nine per cent of the traffic was motor. "Old Dobbin" came in for the lone one per cent, which goes to prove that horse drawn vehicles in prosperous farming districts are fast becoming extinct. Only 164 horse drawn vehicles passed over the Rainbow Drive during that week. This drive is the first section of 85 miles of Black Hawk County roads for which paving has been voted. The cost was \$42,000 per mile, one-half of which was paid by the Federal Government.

## Monthly Inspections by Franklin Dealers

SYRACUSE, N. Y., Aug. 16—The H. H. Franklin Mfg. Co. of Syracuse announces that, effective at once, every one of the company's dealerships and sub-dealerships, 538 throughout the country in number, will make a monthly examination of all Franklin cars in their territory. This monthly inspection will, in the opinion of the officials of the company, go a long way toward placing in the hands of owners a correct understanding of the condition of their cars.

Particular attention will be directed to the fact that in many instances a trifling expenditure will correct minor mechanical ailments, which if allowed to run would sooner or later develop into serious defects, resulting in a large repair bill. Detailed plans for the operation of the inspection system have not been worked out but they will be perfected by a series of experiments.

### FRIEND MOTORS RECEIVER

DETROIT, Aug. 16—Friend Motors Corp. and Olympian Motors Co., both of Pontiac, have been placed in receivership by Judge Tuttle in United States District Court here. The Detroit Trust Co. has been named receiver in each case. Friend Motors has been in need of working capital and has been unable to dispose of stock in the recent market. The policy of the receiver has not been determined. Olympian Motors has not been functioning for a considerable length of time.

## Schools Purchase Many Motor Trucks

**International Harvester Orders Also Heavy from Laundries—Farmers' Sales Small**

SPRINGFIELD, OHIO, Aug. 18—Orders for the Springfield light speed motor truck, manufactured here by the International Harvester Co., are being received from various parts of the United States and also from several of the foreign countries. Shipments are going forward to boards of education and to laundry companies.

The demand for the high speed trucks are mainly from the cities and the rural school boards. Only a small amount of the business is coming from the farmers. It is stated that the farmers are unable to purchase trucks owing to the slump in farm products. In numerous instances farmers have two or three crops of grain on hand, and produce is only bringing a small price, compared to those of a few years ago.

The Springfield works of the International Harvester Co. recently shipped a fleet of trucks to Michigan for the use of laundry companies. A good sized shipment was also made to California, where the boards of education plan to operate bus lines this fall. The trucks for handling school pupils are mounted with special bodies having capacity of from 25 to 30 children seated. These trucks can be operated at the rate of speed from 25 to 30 miles an hour. It is stated that they can be run at a much faster clip, if necessary.

## Constantinople to See Tractor Trials Sept. 5

WASHINGTON, Aug. 16—Competitive tractor trials will be held at Constantinople on Sept. 5, under the direction of the Turkish Ministry of Agriculture. Assistant Trade Commissioner Gillespie, at Constantinople, reports to the Bureau of Foreign and Domestic Commerce that written application either in French or Turkish must be made to the Minister of Agriculture prior to Aug. 31. Sealed letters giving the approximate selling price, c.i.f. Constantinople, in Turkish pounds, must accompany the application. Working tests will consist of plowing at depths of 8, 18 and 25 centimeters, pulling harrows, seeders and empty or loaded trucks. All expenses are to be paid by the competitor.

### RECEIVERSHIP IS DECREED

INDIANAPOLIS, Aug. 16—Clarence Weaver has been appointed receiver for the Standard Automotive Corp. by Judge Moll in Superior Court here. The petition was filed by William E. Sanders, a creditor and stockholder. The corporation has a factory at Mooresville, where it is engaged in rebuilding automobiles.

## August Truck Sales Look Good for Coast

### July Totals Distinct Improvement Over June—Tractors Moving Steadily

SAN FRANCISCO, CAL., Aug. 16—The general condition of the motor truck distribution and selling business in northern California, from the Tehachapi Mountains to the Oregon boundary, showed a distinct improvement over that of June. Distributors and dealers in San Francisco, Oakland, San Jose, Sacramento and other centers of motor truck distribution estimate that sales were at least 20 per cent better during July than during June, and that July prospects, for purchases when the crops have been harvested and payment received for them, were 50 to 60 per cent greater than in the preceding month.

This increase in prospects means that sales will be considerably better along toward the end of August, and in September, than they have been during the months of the summer so far passed. August sales bid fair to be good, but the truck dealers are pinning their faith on the September business to make up for summer dullness. In general, in northern California, however, truck sales are not up to the standard the dealers and the dealers' organizations have set.

#### City Sales Are Best

Sales of trucks in the cities and larger towns have gained in proportion, on sales in the country. Six or eight months ago, about four times as many trucks were sold in the country, in proportion to potential users of trucks, as in the city. To-day, this ratio is only about three to two, instead of four to one.

Tractors are moving steadily, but slowly, and their sales seem to be lower than those of June only to the extent that these sales always fall off in the midst of the summer, when the farmer who could afford it has bought his tractor earlier in the year, and the farmer who is preparing to buy one is waiting, either to make a decision as to the one he will buy, or, more often, for the payment for his crops. All in all, however, the selling of commercial vehicles in northern California is in a fairly good condition, and the dealers are far more buoyant in spirit than they were eight to 12 months ago.

#### PLANT TO MAKE TRUCKS

TORONTO, Aug. 16—International Harvester Co. of Canada, Ltd., has announced that its wagon and sleigh plant at Chatham, Ont., is being equipped to take over the manufacture of International motor trucks. These trucks have hitherto been made in the United States and shipped into Canada. Demand now warrants their manufacture in the Dominion. First size to go into immediate production will be model "S" speed truck.

### FARMERS USING FORD CARS; FORD RAILROAD WOULD END LOCAL STOPS

SPRINGFIELD, OHIO, Aug. 17—Because motor cars are being extensively used by farmers, Henry Ford wants permission from the State Utilities Commission to discontinue stops at a number of small towns along his Detroit, Toledo and Ironton Railroad. Ford's railroad has been affected by his Ford motor cars, and as a result he desires permission to discontinue local service to these towns.

Shorter trains of freights, not exceeding 50 cars, are to be handled on this railroad under the efficiency plan adopted by Ford. Formerly much longer and heavier trains have been handled. Many trains handled on this railroad are made up of cars loaded with Ford automobiles. Lately the average has been five trainloads of automobiles daily from the Ford plant at Detroit.

### See 1000 a Month Ford Business for Mexico

DETROIT, Aug. 18—Ford Motor Co. shipments into Mexico are increasing at a rate which indicates that a business of 1000 cars a month will soon be realized by its Houston branch. All Mexican business is controlled by this branch with the exception of the States of Sonora, Sinaloa and Tepic. There are 180 dealers under the branch, which includes, besides its Mexican territory, the entire southern half of Texas.

Shipments from the Houston branch into Mexico were heavier in June than ever before. One trainload contained 248 cars and trucks. Most of the cars and trucks shipped by rail are knock-down. Cars going by way of Tampico by boat are shipped complete.

Representatives of the Ford company have just completed a survey through Mexico in which most of the important cities and towns were visited. Many dealers were appointed and the territory was thoroughly studied with a view to increasing sales and improving facilities in all parts of the republic. Many sections are fertile fields for tractors.

#### DODGE HAS NEW SEDAN

NEW YORK, Aug. 18—Dodge Brothers have made some changes in the design of the Sedan, the new models of which are just beginning to come through to dealers. The total height has been reduced 4 in., but the most conspicuous change is the use of steel disk wheels. The inside arrangements have been shifted somewhat, the divided front seat being eliminated and a solid seat used instead. This has resulted in a change in the door arrangement so that there are two doors and in addition to this the shape of the glass windows has been changed to a square type.

## Atlanta Will Have Novel Parts Depot

### \$2,000,000 Company Formed— Plans to Assemble Both Cars and Trucks

ATLANTA, GA., Aug. 17—With a capital stock of \$2,000,000 and headed by Walter T. Candler, vice-president of the Central Bank and Trust Corp., and one of the best known business men in the South, the Lullwater Co. has been organized and incorporated to establish an automobile industrial institute in Atlanta. Lionel J. Kahn, well known in automotive circles, has been named general manager of the corporation. Several prominent business men are connected with it as original incorporators.

The purpose of the company is to assemble under a single roof separate and individual industrial units of every kind connected with the automotive business. The idea is to make it possible to rebuild an automobile or a truck in this plant, or to repair any automobile or truck regardless of make. This plant will include complete paint shops, trimming and upholstering department, a silver and nickel plating department, and departments, each separate, for welding, boring, grinding, etc. In addition, the institute will accommodate tire, battery, accessory and automobile novelty dealers, and there will be a general parts department that will stock parts of every standard make of automobile in use in the southern States.

The new company has leased from Walter T. Candler one of the largest automobile buildings in Atlanta, which is located on Automobile Row and provides 114,000 sq. ft. of floor space. The building is five stories in height and preparations are under way to get the institute into operation at once.

#### RUBBER FIRMS BUY FABRIC

AKRON, OHIO, Aug. 17—Purchases of tire fabric are being made by virtually all the rubber companies in Akron except the "big four" which were caught with large inventories when the slump came. There is no expectation that fabric prices will be lower this year. The held over cotton crop in the South is of a quality not suited for tire fabric and the new crop is reported to be below expectations. The larger companies are ordering on their contracts but they will not work off their higher priced commitments before the first of next year and it will take Goodyear six months longer.

#### N. I. V. A. TO AID HOOVER

CHICAGO, Aug. 17—The National Implementation & Vehicle Association has appointed a committee of 12 headed by G. W. Crampton of the Deere & Mansur Works, Moline, Ill., as chairman, to co-operate with Secretary of Commerce Hoover on the standardization of farm equipment.

## Propose to Revise Liability Insurance

### Underwriters Call Conference— Reforms in Automobile Business Likely

NEW YORK, Aug. 16—General revision of automobile liability rates will be discussed at a conference to be held in the near future by members of the National Workmen's Compensation Service Bureau. The call for the meeting states that there are indications that coverages and rates are not properly adapted to present conditions. In this connection A. W. Whitney, general manager of the bureau, says:

"It has been evident for some time to the automobile committee and to us in the bureau that this season should see a thorough overhauling of our automobiling rating system. There are many indications that our coverage and rates are not properly adapted to the present conditions in the automobile field. We are working on the problem in this office and have, for one thing, participated in a recent joint conference in Detroit between the bureau, the Fire Underwriters' Conference and a committee from the National Automobile Chamber of Commerce. This meeting, which was for the purpose of discussing fundamental matters of common interest, was of considerable importance in itself and also because it paved the way for a relationship in the future which may do much to bring our practices into closer relationship with the needs of the business.

"We propose to start the work of the automobile committee about the middle of September with an intensive consideration of the general problem."

The call for this conference and the statement by Whitney would indicate that the insurance companies are beginning to take seriously the threat made by automobile interests through the National Automobile Chamber of Commerce that, unless radical changes are made in the present automobile insurance system, mutual companies would be formed for the protection of manufacturers, dealers and car owners.

Reports from various sections of the country show that insurance companies are beginning to take into account the "moral hazard" which has been disregarded in the past.

## Parts Business Good in Passenger Lines

(Continued from page 336)

Orders from manufacturers of light delivery trucks have gone a long way toward keeping business moving along as satisfactorily as it has. Parts makers feel that there is, for the present at least, a far greater opportunity in this field than in the heavy duty field, and expect a more general production of this class of truck than formerly. In their opinion too many truck manufacturers have neglected this opportunity in the past.

### HANSON SALES GROW

ATLANTA, GA., Aug. 16—Reductions in prices of all Hanson models announced Aug. 1 by the Hanson Motor Co. here, resulted in an influx of new orders the first week of the month following

the announcement, officials of the company reporting the sales record for the week exceeds that of any previous week of the past several months. Carload orders were received, some by wire, requesting immediate shipment, from New York, Boston, Pittsburgh, Louisville and Birmingham.

### KISSEL ADDS WORKERS

HARTFORD, WIS., Aug. 18—Since Aug. 1, the Kissel Motor Car Co. of Hartford, Wis., manufacturer of passenger cars and trucks, has increased its working force by 100 to 125 men who were laid off early in the spring. New business is developing so satisfactorily that it is believed possible to keep on increasing the force steadily.

### CADILLAC INCREASES FORCE

DETROIT, Aug. 16—Cadillac Motor Car Co. is increasing its working force to meet increased demand for its product from larger cities of the country. About 1000 men will be added, factory officials declare, bringing production up to 65 cars a day, or 75 per cent of normal output. New business is reported to be running about even as regards enclosed or open models, with the enclosed car a slight favorite. Though the principal source of the new business is from leading industrial centers, the company declares improvement is becoming general.

### DEMAND FOR NASH CARS

KENOSHA, WIS., Aug. 17—The Nash Motors Co. reports that the demand for its cars following the price cuts last month exceeded production by more than 50 per cent notwithstanding a considerable increase in the production schedule. Indications are that the heavy demand for cars will continue well in September. Dealers stocks generally are depleted and orders are being booked for future delivery. The demand for cars is divided almost equally between four and six cylinder models. Sales thus far in August have been fully as brisk as in July when Nash production was 2470 automobiles.

### INCREASE FORGE OUTPUT

INDIANAPOLIS, IND., Aug. 18—Announcement has been made by the officials of the Imperial Drop Forge Co. of Indianapolis to the effect that large orders have been received from the manufacturers of the Dort and Lafayette cars, which has enabled the company to increase its production to a point near maximum. Company officials say the orders are the largest that have been received since the peak of last year.

### HENRY L. INNES DIES

JACKSONVILLE, FLA., Aug. 16—Henry L. Innes, president of the American Motors Export Co. of this city, died here to-day. He formerly was connected with the Dodge Bros. Motor Co., the Chevrolet Motor Co. and the Parish & Bingham Corp.

## German to Handle Sales for Durant

### Leaves Olds to Join Ver Linden— Michigan Subsidiary Incorporated

NEW YORK, Aug. 16—Leon R. German, former comptroller and vice-president of the Olds Motors Division of the General Motors Corp., has been appointed sales manager for Durant Motors Corp. of Michigan, which is headed by Edward Ver Linden, former president and general manager of Olds. He will have charge of Durant sales in the territory between the Adirondacks and the Rocky Mountains and will assume his duties Sept. 1.

### Close to Ver Linden

German has been closely associated with Ver Linden since 1913, when the latter became works manager for Olds. When Ver Linden was appointed general manager in 1916, German was given a more responsible position and finally was elected vice-president. He has been in charge of operations at the Olds plant since the retirement of Ver Linden. Announcement that he would join his former chief was made in AUTOMOTIVE INDUSTRIES several weeks ago.

Incorporation papers for Durant Motors Corp. of Michigan have been filed at Lansing. The capitalization is \$5,000,000 in common stock with a par value of \$10. W. C. Durant, vice-president, holds 130,000 shares. The other incorporators are: Edward Ver Linden, president and general manager; Edmund C. Shields of Lansing, secretary and treasurer; Carroll Downes and C. F. Daly of New York, all of whom hold 100 shares. Downes is connected with the Durant Corp. and formerly held a responsible position in a Philadelphia bank.

### Plant Nears Completion

Work on the new plant at Lansing has progressed so rapidly that it is expected production of cars will begin by November. The Durant Four will be assembled in the meantime at the Long Island City plant.

Announcement is made at Durant headquarters that a complete line of six-cylinder automobiles, including five-passenger and seven-passenger touring cars, runabouts, coupes, sedans and limousines, will be made by the Durant Motor Co. of Indiana, which has taken over the Sheridan plant of the General Motors Corp. The directors of the Indiana company are Durant, T. W. Warner and D. A. Burke.

### OGREN CREDITORS MEET

MILWAUKEE, Aug. 17—At a meeting of 55 creditors of the Ogren Motor Co. a committee of five was appointed to ascertain the condition of the company and report at another meeting which will be held as soon as possible.

## Ford Plant in Japan Makes Speed Record

Car Assembled from 200 Parts  
Ready for Road in 1½ Hours  
in Yokohama

YOKOHAMA, July 30 (By Mail)—The Ford assembling plant established here by Sale & Frazar, who represent the Detroit manufacturer in Japan, has made a new speed record for the Orient. A complete car assembled from 200 parts is ready for the road in 1½ hours after the assembling begins. The work is carried on in a frame building 148 by 108 feet, where the crates containing the parts are unloaded direct from the docks to which they are brought by steamers from New York via the Panama Canal.

Once the Ford is uncrated it is handled by various shifts of workmen in the plant at Negishi, which was opened in July, 1920, and is in charge of H. F. Brett, who was connected with the Ford plant in the United States before he came to the Orient. His assistant is F. Bennett, who was in the Highland Park Ford plant for 15 years. Both men are enthusiastic over their present chief, E. W. Frazar, who has built up a huge importing and exporting business in the Far East. In the 15 acres which take care of his interests at Negishi he has the Ford assembling plant, a Fordson tractor demonstration field where Japanese army men buy tractors, a big storehouse for Ford parts and a lumber mill.

There are crews of men to handle each stage of the assembling of the car. This is a great departure from the way the work was handled a few years ago. The first step is to lift the body out of the big box, in which it is shipped, by means of ceiling chains. The frame, the rear springs, the running boards and brackets all come in order and the car passes up the assembly line on two rails very much like railway tracks and on the way takes on the control shafts, the front axle assembly, the rear axle and differential assembly. The motor has previously been tested and is in the car. The last step in the assembly is to lower the body on to the chassis.

Normally six cars a day may be assembled at the Negishi plant, which is the outpost of Ford efficiency in the Orient. Last month was a busy one and the workers at the Negishi institution were kept working at the highest rate of speed yet attained.

### LROYER MOTORS BUILDING

STOCKTON, CAL., Aug. 16—Completion of the Lroyer Motors Co. factory here will represent an investment of \$250,000, in 30 acres of ground and buildings, which are now well under way. The plant is to manufacture the Wizard four-pull tractor. Building has been stimulated noticeably in the Cherokee Lane section by the erection of this factory on that thoroughfare.

### Turning Out Fords at Yokohama

*Progress of Fords at the Negishi plant, Yokohama. The men are working on cars in comparative stages of assembly*

### British Makers May Cut Prices to Swell Sales

LONDON, Aug. 9 (By Mail)—Although there is some reason to be hopeful regarding the improvement of trading conditions in consequence of settlement of labor and other economic difficulties, it is doubtful whether the results of this year's trading and possibly even those of next year will be sufficient to wipe out the heavy losses suffered by some of the automobile manufacturers.

Before trade can be resumed on a substantial basis it will be necessary to mark down prices and further reductions are almost certain now that the engineers' union, embracing 1,500,000 men in various skilled and semi-skilled trades, has accepted a substantial reduction in the wage and piece rates. In view of this fact companies which have showed heavy losses probably will have all they can do to earn a covering profit on the coming year's turnover. Carry-over debts will have a serious effect on next year's net profit and may prevent the selling rate per car being made low enough to meet the reduced cost of U. S. cars.

### BRAZIL BUSINESS OFF

WASHINGTON, Aug. 15—According to reports from Sao Paulo, Brazil, conditions in the automobile market of that city are even worse than in Rio de Janeiro. Large consignments of cars are to be held by the banks by reason of the refusal of the consignees to meet the drafts covering their shipments. The latest statistics show that during December, 1920, 56 trucks and four chassis and 599 automobiles complete and three chassis were received in Brazil from the United States. During November of the same year 85 trucks and 15 chassis and 582 automobiles and 12 chassis were received.

### Australia Has Tentative Contract for Airplanes

WASHINGTON, Aug. 16—A tentative contract has been agreed upon for the construction in Australia of Australian parts of six airplanes to be used as training machines for the air force. The contract is to be let by the air council, according to Vice-Consul Ray Fox, and supervision and inspection is to be carried out by the arsenal branch of the defense department, while orders for the construction will be given to the Australian Aircraft & Engineering Co. of Sydney. At present steel of the required specifications is not manufactured in Australia, but it is anticipated that with the definite establishment of the airplane industry the necessary steps will be taken at the existing steel plants to comply with the special requirements. The company has been engaged in commercial construction of airplane parts and repairs for some time and proposes to undertake commercial as well as official construction work.

### GOODYEAR LAYS OFF 900

AKRON, Aug. 16—President Wilmer of the Goodyear Tire & Rubber Co. announces that 900 men will be laid off this week, but that the reduction in the factory force is expected to mean only a slight curtailment of production, because of the steadily increasing individual efficiency of factory operatives. Goodyear has been averaging 2500 tires a day for the last few weeks in the Akron plant and 3500 tires in the California factory. No further reductions are contemplated for the remainder of this month, although the usual dull season for the tire industry in September and October may mean a curtailment of production next month.

## Outlook for Sales Improves Steadily

### Truck Industry Only in Infancy Close Observers Say—Motor Freight Develops

(Continued from page 336)

The various plants of the Fisher Body Corp. has so much inclosed body work booked that they can accept no more orders for work of that character.

A dispatch to AUTOMOTIVE INDUSTRIES from its Cleveland correspondent says:

"Cleveland body companies, especially those making inclosed bodies, are gradually swinging toward normal production. Within the last 30 days orders have been booked in much larger numbers. A further increase is expected after Sept. 1, and there is every indication that business will continue good throughout the winter. Demand as a rule is far ahead of the pre-war record and in some cases it is running close to the record-breaking figures of 1920.

With business surprisingly good for midsummer, there is every reason to believe it will improve steadily as the year advances. Encouraging factors are coming more and more to the front. Railroad earnings are steadily climbing because of the larger freight tonnage. The crop movement at this time of the year is seasonal, but more freight cars are being used for the movement of general freight. The improvement noted in steel orders for the past three weeks is holding its own.

Harvesting is being done this year unusually early and farmers are eager to get their crops to market. The wheat harvest has stimulated business generally throughout the Kansas City district. The yield was larger than anticipated, and a big corn crop is practically assured. Wholesalers of various lines of merchandise report an increased demand, indicating that the farmers are coming into the market.

The Northwest, all the way to the Pacific Coast, has been pretty thoroughly deflated and the worst is over in that section. While business will not return to normal for several months, the trend will be gradually upward and there are signs that the turn has begun already.

A distinctly better feeling is apparent in the South with some degree of stabilization in the cotton market. There was a sharp curtailment in cotton acreage this year and the crop is not as good as normally. It is becoming apparent that the hold-over in warehouses is not as large as has been generally believed. For these reasons cotton growers are certain to get better prices for their crop than they expected. Increased diversification of crops in the South is another favorable factor.

Altogether, the outlook for the automotive industry is growing brighter day by day. Apparently it is going to escape the worst of the usual seasonal slump.

## Future Looks Bright, Is General Report

### LOUISIANA GAINS DUE

NEW ORLEANS, Aug. 15—Business conditions in Louisiana this fall will show an improvement over the first nine months of the year, although sales are not expected to reach the volume of last fall. The general impression seems to be that farmers in this section will be required to liquidate their bank indebtedness to such an extent that they will have little money with which to purchase automotive equipment but the country banker probably will assist worthy dealers in clearing actual sales although discouraging the dealers from stocking excess vehicles.

These bankers will handle some deferred payment paper but it will be more closely scrutinized than ever before and they will have to be assured that the purchaser is financially responsible outside the car itself. They also will require larger cash payments.

General business conditions show a slight improvement and inventories are gradually being worked down. Merchants are taking their losses and cutting expenses. There is confidence that better times are coming but the process of readjustment is slow.

### CHARLOTTE HOPES HIGH

CHARLOTTE, N. C., Aug. 15—Automobile business next fall and spring in this section is expected to be practically double that of a year ago. It is not likely however, that farmers who raise tobacco and cotton will be able to do much buying after they have liquidated their indebtedness. Indications are that country bankers will be very conservative in regard to handling automobile paper for the small town dealers. These bankers are loaded with notes given by farmers on last year's crops, which have not yet been sold and there is very little money in the smaller centers.

### NEBRASKA PICKING UP

LINCOLN, NEB., Aug. 18—Automotive equipment jobbers of this city who have been making a survey of business conditions report a slight but steady upward turn in buying and indications from most parts of the State that this will be continued. Farmers have begun to sell the new crop and are also disposing of some of last year's crops held with the hope of higher prices and they are starting in to spend the money. Retailers in the automotive equipment field are reported to be feeling more cheerful than for several months.

### IDAHO GAINS SLOWLY

BOISE, IDAHO, Aug. 16—Business conditions in Idaho are slowly beginning to pick up according to a survey made by Guy Flenner, secretary and manager of the Idaho Automotive Trade Associa-

tion. The State was hard hit by failure of last year's crops to bring profitable prices and some of the automotive men have suffered considerably through the transactions of dishonest dealers. With the turning of present season's crops into cash, buying again is on the upward grade.

### TEXAS OUTLOOK FAIR

HOUSTON, TEXAS, Aug. 15—While conditions in southern Texas still are bad, the outlook for general business for the next year is reasonably encouraging. Prospects are that it will be slow for the next six months but that after that there will be a marked improvement which will carry it rapidly toward normal. Few of the farmers in this section will have funds to purchase automobiles or tractors when they have finished paying off their indebtedness this fall but with the harvesting of another crop they will be back in the market for automotive equipment.

### CENTRAL OHIO GAINS

COLUMBUS, OHIO, Aug. 18—A slight improvement in the demand for trucks is reported in Columbus and central Ohio territory. This has been most noticeable since Aug. 1 and is especially marked in the lighter trucks and delivery wagons. Heavy trucks ranging from 2½-ton to 5-ton vehicles are still rather slow. Truck dealers are of the opinion that with a slow revival of business which is promised during the fall there will be continued improvements in the truck business. A better feeling is developing in farming communities as crop prospects have been improved by recent heavy rains. It is now believed that the worst of the slump in the truck business is now over and that business will show a gradual improvement.

### CARL VON POETTGEN DIES

DETROIT, Aug. 18—Carl S. Von Poettgen, senior member of C. S. Von Poettgen, Inc., advertising counsel of this city, died here this week. In his life he had an active part in the development of the automotive industry, his firm handling the accounts of many leading manufacturers of cars and parts.

### A CORRECTION

NEW YORK, Aug. 17—In a description of a new 1-ton Larrabee-Deyo truck in the August 4 issue of AUTOMOTIVE INDUSTRIES, through a typographical error this appeared as a six speed job where as a matter of fact the truck is a six cylinder model designed especially for higher speed.

The use of the hyphen instead of the comma completely changed the meaning of the sentence.

## Kansas City Plans Keen Bid for Sales

### Intensive Campaign Proposed— Farmers Are Liquidating Their Debts

KANSAS CITY, MO.—Two factors are operating to retard motor car and truck sales during August. One is the failure of the harvest returns to cover liquidation needs for farmers and merchants, and the other is the temporary depression into which retailers, and especially jobbers, have fallen, since reviewing the business of the first six months of this year.

The first factor is not as serious as it sounds, although it is generally admitted that the circulation of money has not reached the extent that had been anticipated for this month. Optimists had declared that the harvest returns would enable farmers to meet most of their back bills, and consequently merchants would be able to pay up their back bills, too. But this has not been the case. Many merchants will have to be carried over till winter on their 1920 overhanging indebtedness. They and the farmers are paying current bills promptly, but somehow the 1920 residue seems to stick in the unpaid files.

Wheat is not yielding the total revenue expected, but corn is turning out far better than expected, and other forage crops are in unusually good condition and volume. The total revenue of farmers, therefore, will be large for the year and eventually the volume of money will be adequate for normal present business and for the liquidation of the 1920 balance. There may be a few failures during the coming four months—but at last the readjustment is in sight.

The depression of merchants is due to their discovery that they have not made as much money this year as last.

In some cases the discovery has been of a very small profit for the six months or for the fiscal year. It has been a

strenuous period, with the necessity for extraordinary effort to secure a volume in money equal to last year, involving turnover of a great deal more merchandise. The merchants have been under a strain, and they have relaxed, often into melancholy, but an unusual number of them are on vacations, from which they will return with new vigor.

It is certain that merchandising in this community will be unprecedentedly vigorous this fall. Many merchants are known to have left orders for the preparation of big programs for selling, and it is notable that these programs do not involve special sales of bargains so much as special means of attracting attention to merchandise.

Merchants are swarming into Kansas City to buy merchandise, and it is obvious that about the same program of aggressive merchandising will be carried on throughout the territory in the fall. Motor car and truck dealers who adopt the "merchandise emphasis," who adorn their display windows, concoct original means of attracting attention, and get the spirit of pushing merchandise aggressively, on the assumption of a large purchasing power that minimizes price, will doubtless report later that trade has been wonderfully good this fall.

### Advisory Board Will Run Supreme Motors

WARREN, OHIO, Aug. 17—Creditors of the Supreme Motors Corp. have decided that the affairs of the company can best be conducted by the appointment of an advisory committee of creditors to act with the officers of the company. F. B. Whitlock, vice-president of the Interstate Foundry Co. of Cleveland, has been appointed chairman of this committee. An agreement has been formulated contingent on the stockholders raising at least \$125,000 to be disbursed under the direction of the advisory committee. Payment of all claims would be extended to Oct. 1, 1922, with acceptance by the creditors of 7 per cent notes for the amount due them.

## Coast Gas Cuts May Mean Labor Trouble

### California Expects Disturbances to Follow Coming Wage Reductions

LOS ANGELES, Aug. 16—The 2-cent a gallon cut in the retail price of gasoline in California may be followed by serious labor disturbances in the oil fields, according to predictions now being made. Gasoline now retails at 23 cents a gallon. The Standard and Union companies were the first to make the cut and independents naturally followed at once. It has been known for some time that these companies had an over-supply of the fuel on hand and were getting ready to enter into more severe competition against several organizations that have been shipping gas here from the Oklahoma and Texas fields.

It is being predicted that once again California will see a gasoline war. In the big producing fields there is much less activity than one year ago. When these producers were unable to keep up with the demand enormous supplies were brought in from eastern fields. Some companies have kept on importing and have built up a large trade. It is a self-evident fact that the California producers can market their product cheaper than it can be brought from eastern states if they see fit, and with an overstock on hand it is very likely they will take this opportunity to make it hard for the importers, according to views expressed by those in position to know.

Acting upon the claim of over-production and slackened demand, the cut in price of gasoline has been followed by an announcement that oil field workers will have to stand for a cut of \$1 per day in wages beginning Sept. 1. The workers will resist this cut bitterly, according to reports, and if they do it is not improbable that there will be some very interesting and serious developments.

## Statistics Given Hoover Show Increase in Rubber Tire Production

WASHINGTON, Aug. 15—The survey of current business for July issued by the Department of Commerce contains for the first time data on the production of rubber tires. This data was supplied by the Rubber Association of America. It takes November, 1920, as the basic month and shows a large increase each month since then except for December of last year, when there was a falling off in production. The table follows:

[Base Month in Bold Type.]

Pneumatic Tires.				Inner Tubes.			Solid Tires.			Raw Material Used.	
YEAR AND MONTH.	PRODUC-TION.	STOCKS.	SHIP-MENTS—DOMESTIC.	PRODUC-TION.	STOCKS.	SHIP-MENTS—DOMESTIC.	PRODUC-TION.	STOCKS.	SHIP-MENTS—DOMESTIC.	FABRICS.	CRUDE RUBBER.
	Number.	Number.	Number.	Number.	Number.	Number.	Number.	Number.	Number.	Pounds.	Pounds.
<b>1920.</b>											
November ..	<b>649,742</b>	<b>5,880,016</b>	<b>806,023</b>	<b>742,815</b>	<b>6,131,935</b>	<b>920,938</b>	<b>21,355</b>	<b>298,875</b>	<b>34,217</b>	<b>1,801,750</b>	<b>6,563,258</b>

## Automotive Industry to Bear No New Tax

### Additional Imposts Not Included in House Bill—"Stigma Tax" Remains

WASHINGTON, Aug. 16—No additional taxes were proposed for the automobile industry in the tax bill as reported by the House Committee on Ways and Means. The Federal flat tax of \$10 per car and other modes of assessment on automobiles suggested by the Secretary of the Treasury were not mentioned in the committee bill. However, the committee failed to remove the discriminatory excise taxes which are known in the industry as "stigma" taxes.

An amendment to the excise taxes relating to accessories, merely changed the wording of the subdivision. The amendment would make subdivision 3 of Section 900 of the Revenue Act of 1918, read as follows:

"Tires, inner tubes, parts, or accessories for automobile trucks, automobile wagons, other automobiles, or motor cycles sold to any person other than a manufacturer or producer of any of the articles enumerated in subdivision (1) or (2) or in this subdivision, 5 per centum."

#### "Depressing Influences"

Chairman Fordney stated that the committee was of the opinion that "the exacting of the present excessive sums of taxes from the country contributes in no small degree to the depressing influences under which business and industry in general are staggering as an aftermath of the World War. The reduction of the tax burden is essential to business recovery and such reduction can only be based on a rigid enforcement of a policy of the strictest economy in the running expenses of the Government."

There is strong evidence that the House bill was drafted more for political expediency than for practical purposes. The belief exists that the yield contemplated in the House bill will fall far short of the revenue necessary to maintain the Federal Government. There is a feeling that the House bill will be revised in the Senate in order to provide sufficient funds.

The Republican conference changed the proposal of the House Committee on Ways and Means in order that the repeal of the excess profits tax and the reduction of the surtax and the 2½ per cent increase in corporation taxes should become effective January 1, 1922, instead of January, 1921. This change means that merchants will be obliged to pay taxes on the calendar year, a period which has been characterized by depression.

The House committee had originally proposed that if a corporation made a return for a fiscal year beginning 1920, and ending 1921, the war profits and excess profits tax for the portion of the year falling within the calendar year of

### TRAILER PLANT SET AFIRE; BLOODHOUNDS ON TRAIL OF FIREBUGS

MILWAUKEE, WIS., Aug. 16—Wisconsin State fire insurance and fire prevention authorities are of the opinion that an incendiary is working to wreck the plant of the Highway Trailer Co. at Edgerton, Wis. On the night of July 4 fire destroyed an assembling building and warehouse, 190 x 960 ft. in area, causing a loss of more than \$250,000. Investigation developed suspicions of incendiarism. A short while ago another mysterious fire occurred causing a loss of \$25,000. Blazes were found simultaneously in several parts of the building. Officials of the Highway company immediately summoned the State fire marshal and several inspectors and provided bloodhounds, but the trail was lost on a road leading out of the city of Edgerton.

1921, would be an amount equivalent to the same proportion of a tax for the entire period computed under the revenue act of 1918, the portion of such period falling within the calendar year 1920, as of the entire period. They had also intended to credit any payments on account of the tax or refund but this will not be necessary under the agreement reached among Republican leaders of the House.

Because of the depression in the automobile industry during the latter part of 1920, and the early months of this year, the question of taking credit or deduction for losses against net profits is of the utmost importance. The House bill proposes to revive the net loss allowance in modified form by providing that if for any taxable year beginning after Dec. 31, 1920, it appears upon the presentation of evidence satisfactory to the commissioner that any taxpayer has sustained a net loss, the amount thereof shall be deducted from the net income of the taxpayer for the succeeding taxable year; and if such net loss is in excess of the net income for such succeeding taxable year, the amount of such excess shall be allowed as a deduction in computing the net income for the next succeeding taxable year.

Under a special rule, the bill will be passed Saturday and forwarded to the Senate, but the recess of the Congress until late in September, will delay the final enactment until October, and the same is true of the tariff bill.

#### TRAYLOR TRUCKS CUT

CORNWELLS HEIGHTS, PA., Aug. 17—Lower prices for all models of its trucks have been put into effect by the Traylor Engineering & Mfg. Co. The prices follow:

Model	Old Price	New Price
B—1½ ton	\$2500	\$2390
C—2 ton	3000	2850
D—3 ton	3500	3300
E—4 ton	4700	4450
F—5 ton	5100	4700

## Hudson-Essex Makes Third Cut in Prices

### Changes Take Effect Immediately —Hudson Coupe Drops from \$3,125 to \$2,770

DETROIT, Aug. 17—The third reduction in price since the readjustment process began is announced by the Hudson Motor Car Co. The prices, which are effective immediately, follow:

Hudson:	New Price	Old Price
Touring car.....	\$1895	\$2250
Coupe .....	2770	3125
Sedan .....	2895	3250
Essex:		
Touring and roadster..	1375	1445
Coupe .....	1880	1950
Sedan .....	2230	2300

Prices of the other Hudson models are: Cabriolet, \$2,495; touring limousine, \$3,120, and limousine, \$3,495.

## Pierce-Arrow Reduces Passenger Car Prices

BUFFALO, Aug. 15—Following is the price schedule on Pierce-Arrow passenger cars, effective Sept. 1 as compared with the old prices:

	New Price	Old Price
Touring cars.....	\$6500	\$7500
Roadster .....	7000	8000
Coupe, 3 passenger.....	8000	(new)
Coupe-sedan, 4 passenger	8000	8500
Town brougham.....	8000	8500
Sedan, 4-door, 4 passenger	8250	(new)
French limousine.....	8250	(new)
Limousine, 7 passenger...	8250	8750
Landulet .....	8500	9000
Sedan, 6 passenger.....	8500	9000

## General Motors Cuts Prices on All Trucks

PONTIAC, MICH., Aug. 17—General Motors Truck Co. announces price reductions, effective Aug. 17, on all its models. The largest cut is on the one-ton. The prices follow:

	New Price	Old Price
Model K 16 1 ton.....	\$1495	\$1995
Model K 41 2 ton.....	3000	3250
Model K 71 3½ ton.....	4250	4500
Model K 101 5 ton.....	4650	5100

#### KOEHLER TRUCKS CUT

BLOOMFIELD, N. J., Aug. 17—Price reductions averaging about \$500 on its trucks and tractors have been announced by the H. J. Koehler Motors Corp. The prices follow:

	New Price	Old Price
Model D 1½ ton.....	\$1885	\$2285
Model M 2½ ton.....	2875	3365
Model MCS 2½ ton.....	2975	3450
Model F 3½ ton.....	3985	4450
Model MT 5 ton, road tractor .....	2975	3450

#### REDUCE KING CARS

DETROIT, Aug. 17—The King Motor Car Co. has made substantial reductions in its prices. The list follows:

	New Price	Old Price
4 and 6 passenger touring	\$2225	\$2725
Roadster .....	2140	2740
Coupe .....	3125	....
Sedan .....	3235	4035

## Ver Linden Answers General Motors Suit

**Amplifies Statement of Counsel,  
Claiming \$709,037 by Way  
of Recoupment**

DETROIT, Aug. 16.—The answer of Edward Ver Linden to the suit for recovery of \$490,000 brought by General Motors Corp. as filed in United States District Court here, consists of a complete rebuttal of the allegations of the corporation, and announces that he will claim the sum of \$709,037 by way of recoupment. The case will be moved for trial when court convenes, but is likely to be long delayed owing to the heavy calendar of cases preceding it.

In setting forth his claims, Ver Linden amplifies the statement made by his counsel, Thomas, Shields & Silsbee, following the first filing of the suit by General Motors. The terms of his contract made under the Durant régime on Aug. 1, 1918, are set forth in the answer, showing that he was to receive \$100,000 a year salary and a percentage on earnings in excess of \$2,000,000.

Outstanding features in the contract quoted are:

On earnings up to \$5,000,000, the general manager to receive 5 per cent.

Earnings from \$5,000,000 to \$10,000,000, the general manager to receive 3 per cent.

Earnings \$10,000,000 to \$20,000,000, the general manager to receive 1 per cent.

In case corporation's earnings exceed or fall short of 30 per cent on the total capital invested, exclusive of good will, 2 per cent is to be added or deducted for each 1 per cent of excess or deficiency.

The amount of net earnings as determined by the corporation and set forth in its books shall be final.

Among other deductions or allowances from gross earnings shall be all necessary or proper reserves for losses, bad debts, insurance and other contingencies, suitable amounts for depreciation, besides all taxes, State, Federal or local, including Federal income and capital stock taxes, but excluding Federal war profits taxes and excess profits taxes.

Net earnings of division to be modified by rate of net earnings of the corporation.

One-third of the percentage earned at the end of the first year to be paid one-third in corporation's bonus stock, and in succeeding years two-thirds to be paid in bonus stock.

The aim of this form of compensation was to effect a large and continuing investment in General Motors stock by general managers.

Stock forfeiture clauses in the event of discharge or voluntary leaving were waived, the answer declares.

Money declared retained by the company to pay for bonus stock is as follows: 1918, \$108,080; 1919, \$234,230. Claim is made to \$166,727.33 as due for 1920 on basis of contract. An interest demand of \$2,916 on balance of 1918 salary held for two years is also made. To this is added \$100,000 as salary due for 1921, as per contract, and \$100,000 is added for probable share of earnings in 1921. Leave is asked to plead for such money as represents percentage on profit of Olds for 1921, when such can be ascertained.

## July Shipments of Cars and Trucks 61 Per Cent of July 1920 and 7 Per Cent Less Than June 1921

NEW YORK, Aug. 16.—Reports made to the National Automobile Chamber of Commerce show that July shipments of cars and trucks by its members were 61 per cent of July, 1920, and 7 per cent less than for June of this year. Last year shipments were 4 per cent less than in June. Shipment figures by months thus far this year are:

	Carloads		Driveaways		Boat	
	1920	1921	1920	1921	1920	1921
January .....	25,057	6,486	29,283	3,186	.....	93
February .....	25,505	9,986	43,719	7,597	.....	99
March .....	29,326	16,287	57,273	9,939	.....	75
April .....	17,147	20,187	64,634	14,197	.....	1,619
May .....	21,977	18,608	74,286	15,193	.....	2,381
June .....	22,516	20,269	60,746	18,834	8,350	3,947
July .....	23,082	19,470	52,342	15,320	8,702	3,725

## F. W. Warner Directs Durant Stock Sales

DETROIT, Aug. 17.—Fred W. Warner, former president and general manager of the Oakland Motor Car division of the General Motors Corp., has been placed in charge of the selling of stock for the Durant Motors Corp. of Michigan. Warner was the first of the General Motors executives to retire after the formation of Durant Motors, but he remained a director of the corporation, although it had been understood he intended to join Durant. He went with the Oakland company in 1914 as general sales manager from Chicago, where he had been manager of the Buick branch since 1911.

Warner is a native of Chicago. He began his business career with a retail hardware store in McPherson, Kan., where he remained until 1890, when he went with the John Deere Plow Co., Kansas City, as a salesman. When he left in 1904 he was sales manager. His next business venture was with a wholesale implement and vehicle house in Dallas, Tex., where he remained until he went with the Buick company.

## HOUSE REJECTS DYER BILL

WASHINGTON, Aug. 16.—Though the Senate passed the bill known as S. 2272 to amend the National Motor Vehicle Theft Act imposing a fine of \$5,000 or five years' imprisonment, the House failed to approve the so-called Dyer bill which proposes to amend the act by putting in the word "embezzlement" to prohibit interstate transportation of stolen vehicles. Congressman Garrett, Democrat, of Tennessee, has been the chief opponent of the measure and his objection defeated it in the House. Congressman Dyer, the author of the House bill, stated that automobile manufacturers, dealers and users were in favor of the legislation as it would fortify and make the automobile theft act stronger.

## SEAHOLM CHIEF ENGINEER

DETROIT, Aug. 17.—E. W. Seaholm has been appointed chief engineer of the Cadillac Motor Car Co., succeeding B. H. Anibal, who resigned to become chief engineer with the Collins Motor Car Co. Seaholm had been assistant chief engineer at Cadillac since 1913.

## Commission Proviso Out of Highway Bill

WASHINGTON, Aug. 17.—As the result of an eleventh hour change of front on the part of Senate leaders, the provision of the Townsend highway bill authorizing establishment of a Federal highway commission to direct highway construction and maintenance was defeated to-day.

It was this principle of control for which the automotive industry has consistently fought. The parliamentary movement proved a surprise to Senator Townsend as well as southern senators who had heretofore opposed any change in the distribution of Federal aid funds. It is stated that the majority leaders abolished the commission proviso because of the fact that reorganization of Government departments will be considered soon and the highway bureau would become a part of the Department of Public Works.

For a time it appeared that the "agricultural bloc" in the Senate had taken control of the highway bill but attacks of Senator Wadsworth and Senator Lodge indicated that it was a drive of eastern States against the Federal aid program as it passed the burden to States already owning improved roads.

Senator Lodge directed his attack on the amount of the appropriation and stated that in accordance with the economy program of the Administration, savings should be made at this time in highway expenditures as it was only fair. The Senate leaders want to keep Federal expenditures down to reduce taxes and as a consequence it is believed they will insist that the proposed appropriation of \$100,000,000 annually be cut in half. The bill will be passed this week with minor changes.

The commission plan was agreed to by unanimous vote of the Senate postoffice committee when it was reported out to the Senate as a compromise measure. It probably would have passed Tuesday night if Senator Pomerene of Ohio had not objected to a vote because he lacked knowledge of the bill's effects.

The Senate leaders decided on a thumbs down policy in the interim. It is understood that their action means transfer of the bureau of public roads from the agricultural department to the proposed department of public works.

## Receiver Named for Signal Truck

### Decree Issued for Dissolution of Maine Corporation—Assets Exceed Liabilities

PORTLAND, MAINE, Aug. 17—Federal Judge Hale has appointed Philip G. Clifford of this city receiver for the Signal Motor Truck Co., a Maine corporation, with its plant at Detroit. Judge Hale also issued a decree for the dissolution of the corporation. The action was taken on complaint of Milton B. Hoagland, vice-president and general manager. He began proceedings in accordance with a vote of the stockholders. While business depression resulted in the closing of the plant, it is asserted that the assets exceeded the liabilities.

The company was incorporated in 1916 with a capital stock of \$600,000 in common and \$200,000 preferred. There is outstanding \$348,000 in common and all the preferred. All the common stock was deposited in a five year voting trust expiring this year. The voting trustees are Hoagland, C. P. King and A. C. Burch. The company has a funded debt of \$190,000 in 7 per cent bonds and \$220,000 in 7 per cent gold notes. J. G. Heaslet is president and H. H. Emmons is secretary.

The company has manufactured five models of trucks ranging in capacity from one ton to five tons. The capacity of the Detroit plant is 1500 trucks a year.

## Colonel Colt, Rubber Chief, Dies of Stroke

PROVIDENCE, R. I., Aug. 13—Colonel Samuel T. Colt, chairman of the board of the United States Rubber Co., died to-day at his home in Bristol after a severe stroke of paralysis which he suffered a week ago. He was born in Paterson, N. J., in 1852. He was named after an uncle who invented the Colt revolver. His mother's family was one of the most prominent in Rhode Island in Colonial days.

Colonel Colt was graduated from the Massachusetts Institute of Technology at 21. He then entered Columbia law school and received a degree in 1876. He began practice in Rhode Island and soon became prominent in the politics of that state. In 1887 Colt founded the Industrial Trust Co. of Providence and while president of that company he entered the field of rubber manufacturing as a legal advisor and reorganizer.

The National Rubber Co. of Bristol was in bankruptcy when he took control and started the plant going again in 1888. Four years later the National company was merged with the United States Rubber Co., which had been formed by Joseph Bannigan. Colt took the presidency of the combination which he retained until 1918, when he became chairman of the board. He was a director of about 40 other corporations.

### MANUFACTURERS ORGANIZE "SAFETY CLUB" AT JACKSON, MICH.

JACKSON, MICH., Aug. 8—A safety club has been organized in this city with H. D. Fisher of the Hayes Wheel Co. as president. Practically all manufacturing companies of the city are included in the membership, which, in addition to planning safeguards in factory operation, will also look to decreasing street accidents. E. H. Ehrich of the Sparks Withington Co. is treasurer, the other officers including city officials and men representing other industrial interests.

## Seek Quick Action on Fisk Reorganization

NEW YORK, Aug. 15—Urgent notices are being sent to stockholders of the Fisk Rubber Co. calling their attention to the necessity for immediate action on the proposed reorganization and recapitalization plan. Another meeting will be held in the near future at which it is hoped definite action will be taken. Apathy on the part of stockholders was apparent at the meeting held last week at Chicopee Falls where the factory is located. The consent of 75 per cent of the preferred stockholders is necessary before they can consider the plan whereby the Fisk Co. would take over all the assets of the Federal Rubber Co. and the Ninigret Co.

It is understood that a banking syndicate headed by Dillon, Read & Co. is ready to underwrite a \$10,000,000 loan in the form of 20 year, first mortgage 8 per cent bonds.

## Willys Predicts Big Car Sales Next Year

TOLEDO, Aug. 17—Activity in the automobile industry will be greater in 1922 than ever known before, declares John N. Willys, president of the Willys-Overland Co., in a résumé of the condition of his company issued this week.

He points out that splendid crop prospects and relief for the railroads promises more in the way of prosperity for next year than we have had this.

"Many people who have been getting along with old cars will purchase new ones, while others who have never owned a car will be numbered among purchasers when the returning period of prosperity puts them in position to buy," declared Willys.

In analyzing the work of the company this year he points out that the production of motor cars for Willys-Overland for the second quarter of the year exceeded that of the first quarter by 150 per cent. Shipment of cars during the second quarter was two and one-half times what it was the first quarter.

He anticipates the usual slackened production for a few months, but is confident that 1922 will set new records.

## Stockholders Win in Standard Parts

### Judge Westenhaver Refuses Creditors' Plea for Sale of Assets —Orders Dividend Paid

CLEVELAND, Aug. 16—Stockholders of the Standard Parts Co., which has been in the hands of receivers nearly a year, won a victory to-day when Federal Judge D. C. Westenhaver ordered that the receivership be continued. Creditors of the company had petitioned the court for an order to sell the corporation's assets at once.

Under the creditors' plan they would buy in the plants, form a new company to operate them and the stockholders of the present corporation would be given the privilege of subscribing for a limited amount of stock in the new concern. The creditors would retain control.

The court also allowed the request of the receiver, Frank Scott, for permission to pay a 10 per cent dividend to creditors. Approximately \$1,000,000 will be paid out under this order. The company will have \$500,000 in the treasury after the dividend is paid.

Judge Westenhaver declared that the actual physical value of the Standard Parts Co. is between \$17,000,000 and \$19,000,000 as compared to the \$12,000,000 to \$13,000,000 value fixed by the creditors. Commenting on the earnings of the company, the court expressed the opinion that operating losses during the receivership were less than \$60,000.

He said he believed the plant was being operated economically and that to turn the properties over to the creditors would be inequitable. The court further said that probably none of the plants could be sold at this time, and that if opportunities developed in the meantime, the properties could be disposed of as efficiently through the receiver as under the creditors' control.

The company, under the receivership, has made money in recent months. August business is holding up better than the average August in the past, and the management expects even better business during the fall months.

### MERCER PLAN RATIFIED

NEW YORK, Aug. 16—Stockholders of the Mercer Motors Co. have ratified plans for the reorganization of the company as they were outlined two weeks ago. Theodore E. A. Barthel was elected vice-president and treasurer and George L. Catlin, assistant treasurer and secretary. W. A. Smith will be general sales manager. Reorganization of the company will be put into effect as soon as working capital becomes available through the new financing. The stock and bond issues proposed have been largely subscribed already, and it is not expected there will be any further hitch. Under the reorganization Mercer will be divorced entirely from Hare's Motors and will be operated as a separate entity.

## \$12,533,909 Profit for General Motors

Statement Shows Gain of \$10,-  
858,507 in 2d Quarter—  
Balance Sheet Filed

NEW YORK, Aug. 16—Net profits of the General Motors Corp. for the second quarter of 1921 were \$12,533,909 as compared with \$1,675,492 for the first quarter, indicating the remarkable increase in business which followed the first three months. Total profits for the first half were \$14,209,402, but this amount is cut to \$9,659,531 by a reduction of \$4,549,870 to take care of refunds given purchasers of automobiles under guarantees against price declines. The amount reserved for this refund shows the effect on sales of lower prices.

The statement of earnings and a consolidated balance sheet, filed with the New York Stock Exchange, was accompanied by a letter from Pierre S. du Pont, president of the corporation, in which he told of the progress made in reduction of inventories and current liabilities.

Inventories, which amounted to \$222,098,805 in October, have been reduced to \$147,502,086. Of this reduction, however, \$25,776,112 was accomplished by the writing down of inventories.

### President du Pont's Letter

During the same period of depression accounts payable, which had reached \$40,736,127, have been reduced to \$19,852,581, and notes payable from \$87,596,076 to \$68,808,250. In his letter, President du Pont says:

"The readjustment of financial affairs has been coupled with like improvement in the manufacturing part of the business. All factories have improved the quality and design of cars, so that the General Motors line is quite abreast with or in advance of the best construction practices of the day. The company is unique in its ownership of factories for the making of parts and accessories necessary for quality production at lowest price. Each part may be fitted exactly in workmanship, thus giving to General Motors cars a distinct advantage not enjoyed by cars built up of parts assembled from numerous uncontrolled factories.

"General Motors Corp. maintains a research laboratory that is without equal in the motor world. Here every part and assembly of parts is subjected to most rigid test and criticism, so that General Motors products, even when newly introduced, have been subject to practical proof. In this laboratory many new devices are being tested and much experimental work is being done toward maintenance of General Motors quality."

The consolidated balance sheet shows current and working assets of \$234,179,805, including \$49,363,653 in cash, \$5,547,867 in sight drafts against bills of lading, \$9,133,387 in notes receivable, \$21,042,606 in accounts receivable and trade acceptances and \$147,502,086 in inventories.

Current liabilities amount to \$110,060,804, including \$19,852,581 in accounts payable and trade acceptances, \$68,808,250 in notes payable and \$20,381,334 in taxes, payrolls and sundries accrued but not due.

## General Motors' Remarkable Gain

The income and surplus account for the six months ended June 30, follows:

	First Quarter	Second Quarter	Total Six Months
Net earnings.....	\$3,707,944.49	\$14,551,516.41	\$18,259,460.90
Less: Provision for Employees' Investment Fund .....	510,605.00	580,455.00	1,091,060.00
Interest on notes and trade acceptances.....	1,501,215.60	1,426,109.62	2,927,825.22
Employees' Housing Development.....	2,500.00	300.00	2,200.00
	\$2,014,320.60	\$2,006,264.62	\$4,020,585.22
	\$1,693,623.89	\$12,545,251.79	\$14,238,875.68
Less: Provision for Federal taxes and extraordinary expenditures.....	18,131.26	11,341.89	29,473.15
Balance equals Net Profits before deducting refunds made to customers under agreement of October, 1920, which agreement guaranteed customers against price reductions before July 1, 1921.....	\$1,675,492.63	\$12,533,909.90	\$14,209,402.53
Deduct total liability incurred under aforesaid agreement on account of 1921 sales due to price reductions made previous to July 1, 1921...			\$4,549,870.99
Balance .....			\$9,659,531.54
General Motors proportion thereof.....			\$9,605,675.60
Surplus, December 31, 1920.....			121,273,217.00
			\$130,878,892.60
Less: Preferred and Debenture stock dividends—6 mos.....			3,137,125.43
Common stock dividends—6 mos.....			10,230,975.25
			\$13,368,100.68
Surplus, June 30, 1921.....			\$117,510,791.92

## Britain Expects Trade with Russia again Soon

LONDON, July 30 (By Mail)—There is now definite evidence that general trading with Russia will again become possible in the near future. The great stumbling block has been the reluctance of the Soviet authorities to recognize the financial obligations contracted by Russia under the old regime. It is now reported on official authority that a conference will be held soon to determine the amount of the debt and that when this has been done a plan will be promulgated under which Russia will undertake to resume payments in 1925.

In the meantime business has been developing for the last year or two in the countries which broke away from the former Russian empire and now form the independent states of Finland, Estonia, Latvia, Lithuania and Poland. These states form the threshold of Russia and when Russia begins trading these border states will assume the function of the middleman.

### KENWORTHY FILES PAPERS

INDIANAPOLIS, Aug. 18—A schedule of assets and liabilities was filed in the Federal Court to-day by the bankrupt Kenworthy Motors Corp., of Mishawaka, showing assets amounting to \$124,433.38, and liabilities amounting to \$174,859.49. The concern recently admitted bankruptcy in answer to a creditors' petition, filed against it July 11 by the Auto Cape Top Co., the Western Brass Manufacturing Works of Chicago, and the Cleveland Pneumatic Tool Co. The Kenworthy corporation lists its excise tax due on automobile sales at \$6,980.77 and open accounts at \$119,652.14. Of the assets \$40,000 is in real estate and \$65,683.28 is in stock in trade.

## Registrations Drop in Southern California

LOS ANGELES, Aug. 17—July showed a loss over June of almost 1000 in the number of new car registrations in Southern California. The total for the month was 4290, while June reported 5223, according to figures that have just been made public. As an indication of conditions in the outlying territory, 3078 of the new cars registered were from Los Angeles County. There are 10 counties in what is known as Southern California. The number of trucks and commercial cars registered during the month was 405. The totals to Aug. 1 for the year are 24,788 passenger cars and 3251 vehicles.

### CANADIAN GARY FORMED

DETROIT, Aug. 17—The Canadian Gary Co. has been organized at Fort William, Ontario, to assemble and distribute Gary trucks in Canada and all British possessions. The company will take over the plant of the Canadian Steel Co. and expects to be in operation by Oct. 1. Officers of the company are: President, M. J. Neville; vice-president and general manager, C. Tremblay; secretary and treasurer, J. P. Kenney. The company is capitalized at \$500,000 and hopes to ship enough trucks before navigation closes on the lakes to keep the plant in operation all winter.

### ELGIN, ILL., GETS TRUCK FIRM

ELGIN, ILL., Aug. 16—The Elgin Association of Commerce has accepted a proposition from the Duty Motors Corp., Greenville, Ill., manufacturer of motor trucks, to remove its plant to the former city. A site has been donated to the corporation and suitable buildings will be erected this fall.

## METAL MARKETS

THE time appears to have arrived when the steel market is deserving of greater confidence on the part of buyers and this in their own interest. There are at this time in sight only two possible avenues leading to further downward revision of prices of more than fractional character. One of these is a reduction of freight rates which will come eventually but no one ventures to say when. The other road to a further cut in steel prices, lies along the path of a sufficiently enlarged demand to warrant the assumption on the part of producers that another reduction in prices will bring out a sufficiently large quota of orders to more than make up for such a concession to buyers by the thus augmented rate of mill operations and the corresponding reduction in the overhead per ton of steel produced. Present prices for most descriptions of steel are scraping bottom, especially if prevailing costs are taken into consideration. What relatively slight price movement is in evidence just now is largely a matter of a more rational readjustment of quotations for certain classes of semi-finished and finished steel on the basis of the recently established levels for the raw steel from which they are made. Not only are conversion costs always more or less debatable, depending upon individual plant equipment and management, but, in the present circumstances, there is also quite a range between minimum and maximum wage scales and, in addition, some sheet mills are rolling \$30 sheet bars, others \$35 bars and still others are striving to reduce their losses on \$40 stock as much as possible. Some of the more farsighted captains of the steel industry aver that the time has come to forget costs of high priced material and to proceed even now on the basis of the enlarged demand and lessened overhead costs expected to result from a sagacious price policy as the most efficient means toward bringing about such a condition. In the case of smaller mills with only moderate resources it is natural, however, that they are loath to operate unless an immediate return is in sight. While there is virtually no danger at this time of a prolonged reaction in the steel market's trend, it will be well for the steel buyer to bear in mind that if present endeavors on the part of steel mills to broaden the demand and thus increase operations this fall should prove abortive, a short-lived price rally is not beyond the range of possibility. Such a recoil is now being witnessed in the pig iron market.

**Pig Iron.**—A much firmer tone pervades the pig iron market. Two steel mills operating blast furnaces and being periodical sellers of pig have declared \$20 to be the minimum price at which they will sell No. 2 foundry and, as a result, concessions by merchant furnaces have disappeared. The resale market is also much less attractive to bargain hunters.

**Steel.**—Intensive competition prevails for what automotive sheet orders are hanging over the market. No really large tonnages are being contracted for, even those passenger car builders whose schedules call for relatively heavy tonnages of sheets splitting their orders up into small "trial orders." These are placed with the understanding that if material and deliveries are satisfactory additional orders will be forthcoming. At that, a few sheet mills claim to have a comfortable amount of automotive

sheet business for September shipment on their books.

**Aluminum.**—New Orleans advices state that the Aluminum Line of steamships operated by the American Bauxite Co. will cease on November 1 to bring bauxite from Dutch and British Guiana and that the sole American aluminum producer's bauxite requirements will be met from the Arkansas mines until after a tariff preventing the "dumping" of German aluminum products has been enacted. The market for aluminum ingots, alloys and sheets continues flat. American warehouse stocks of foreign aluminum are estimated at 15,000 to 20,000 tons.

**Copper.**—Although sentiment is slightly improved, the avalanche of supplies precludes anything like genuine recovery at this time.

**Tin.**—Speculative ups and downs feature this metal which continues attractive in price to consumers.

**Lead.**—Automotive battery makers are buying in routine tonnages. The market is fairly steady.

## INDUSTRIAL NOTES

**Modern Die & Tool Co.**, manufacturers of motor bearings, Indianapolis, reports business better than normal, and the plant of the company operating at the limit of its capacity, with production at the highest mark in the sixteen years the company has been in business. "We are booked into the future and are running at full capacity. In our particular line business never was better than it is right now."

**Biflex Products Co.**, Waukegan, Ill., manufacturers of the Biflex spring bumper, has announced its removal into a new and larger factory. It has twice the capacity of the former plant.

Portage Tire Asks for  
Federal Protection

**AKRON, OHIO, Aug. 17**—With the adjudication of the Portage Tire & Rubber Co. of Barberton as bankrupt by Judge D. C. Westenhaver of the United States District Court at Cleveland, officials of the bankrupt company have filed a bill asking protection guaranteed bankrupt companies by Federal insolvency statutes.

The Portage Rubber Co., parent company to the Portage Tire & Rubber Co., also has been thrown into bankruptcy, but creditors have not as yet selected a trustee. George D. Bates has been named temporary receiver of the Portage Tire & Rubber Co., which lists assets at \$1,795,262.39 and liabilities at \$1,031,286.24. These proceedings have halted the receivership of the Portage Rubber Co., which last week was placed in the hands of W. T. Akers as receiver.

According to M. S. Long of Akron, president of both companies, attempts were made last fall to refinance the Portage Rubber Co. and negotiations were proceeding satisfactorily when receivership was petitioned for and obtained by the Adamson Machine Co., the Wellman-Seaver-Morgan Co. and the Factory Oil Co. The claims of these three creditors aggregated about \$47,000.

## FINANCIAL NOTES

**International Motor Truck Corp.** reports for the three months ended June 30 last net profits of \$523,639, compared with a net of \$4,396 during the March quarters, when operations were recovering from the depression of December and January. The balance sheet as of June 30 shows cash of \$3,464,743, against \$3,125,694; accounts and notes receivable \$5,000,519, against \$3,472,348 on Dec. 31, 1920; inventories \$12,013,262, against \$15,599,848. Accounts payable are \$1,005,258. On Dec. 31, 1920, they were \$1,663,843. Surplus is \$10,406,546, against \$10,379,393.

**Denby Motor Truck Co.** proposes to increase its capital stock from \$750,000 to \$1,400,000 by the issue of 65,000 shares of 8 per cent non-accumulative first preferred stock at \$10 per share. A special meeting of the stockholders has been called for Aug. 26 to pass upon the matter, as well as upon \$300,000 first mortgage five-year 7 per cent bonds, \$100,000 Class A and \$200,000 Class B.

**Durant Corp.**, which is handling the distribution of the capital stock of the Durant Motors, Inc., has increased the price of the stock to \$24 a share. The company quickly disposed of the original allotment of 500,000 shares at \$12. But as the demand increased the price was gradually raised to \$18, then to \$20, \$21, \$22, and now to \$24. The stock is selling for \$27 on the New York curb market.

**Stewart-Warner Speedometer Corp.** for the three months ended June 30 reports operating profits before Federal taxes of \$601,945, compared with \$740,843 in the corresponding months of 1920. For the first six months of 1921 profits amounted to \$652,892, against \$1,470,147 in 1920. For the first half of this year the company charged \$440,000 to surplus for inventory readjustment.

**Federal Corp.** of Westfield, Mass., has filed a voluntary petition in bankruptcy in the United States Court at Boston after a vote of stockholders. Liabilities are \$282,908 and assets \$62,544. The concern manufactured automobile accessories.

**Maxwell-Chalmers Co.'s** committee on reorganization has sent a letter to stockholders of the Chalmers Motor Co. who have not deposited their securities which offers them another opportunity to do so without penalty prior to Sept. 15.

**McCord Mfg. Co.** has paid off 10 per cent of its \$4,500,000 bank and merchandise indebtedness, totaling, with interest, approximately \$600,000. The remaining 90 per cent will be extended to Feb. 11.

**Stevenson Gear Co.**, Detroit, has offered \$500,000 preferred and \$50,000 common stock in units of 2 shares each for \$25. It is a \$10,000,000 corporation.

Olds Plans 12,000 Output  
of 1-Ton Economy Truck

**LANSING, MICH., Aug. 18**—Olds Motor Works has outlined a production of 12,000 annually of its new 1-ton Economy truck. Increased sales possibilities have been opened by the remodeling of the truck to 1-ton capacity, officials declare, and business is on the upward trend. Car sales are moving at the rate of 70 to 80 daily, holding to the June and July production figures, while only optimism reigns concerning prospects for the future.

## MEN OF THE INDUSTRY

Norval A. Hawkins, sales director of the General Motors Corp., and previously sales manager of the Ford Motor Co., has been elected a director of the new Northwestern Casualty & Surety Co., of Milwaukee, organized with \$1,000,000 capital and \$750,000 surplus to write accident, health, workmen's compensation, liability, automobile, fidelity, plate glass, surety, steam boiler, burglary and theft, and casualty insurance, including property damage. It will begin business about Oct. 1 and for the present will specialize in Middle West and Northwestern territory.

W. E. McCarthy, formerly sales manager of the Owen Tire & Rubber Co., has joined The Dayton Rubber Mfg. Co.'s sales organization in the capacity of branch manager at Los Angeles, California. Since McCarthy has taken over the branch, the sales force has been increased materially. C. F. Faro, formerly Dayton branch manager, will direct the activities of the Kansas City and Denver branches. H. K. Simmons, formerly New York branch manager, will direct the activities of the Boston, Brooklyn and Philadelphia branches.

Lon R. Smith, vice president, directing sales and advertising manager of the Midwest Engine Co., Indianapolis, has left on his annual business trip to California. Although going to the Coast primarily to get in personal touch with the Utilitor dealer organization and to make an extensive investigation of markets, Smith also is making the trip in the interests of the Midwest heavy duty truck and tractor engine, at the request of truck and tractor manufacturers located on the western coast.

Harry A. Grubb has been appointed assistant sales manager of the Star Rubber Co., Akron, O. Grubb has long been associated in the tire industry with A. G. Partridge, newly elected vice president and sales manager of the company. Grubb's previous position was vice president and general manager of the Oldfield Tire Co., and prior to that he occupied various sales positions in the Firestone organization.

Capt. Eddie Rickenbacker has returned to Oakland to close up his affairs with the Sheridan Motor Co. of California and then return to Detroit, where he will make his headquarters. Rickenbacker is disposing of his interests in the Sheridan coast organization to R. C. Durant, son of W. C. Durant, who, with C. M. Steves, has been associated with Rickenbacker in the Sheridan enterprise since last fall.

E. A. Haertlein has been appointed sales manager of the Gemco Mfg. Co., Milwaukee, manufacturer of automotive equipment and garage fixtures. He succeeds George H. Treviranus, who resigned to become associated with a new concern now in process of organization in Milwaukee to engage in the manufacture of rowboat motors and other small internal combustion engines.

Wm. H. Herbert has been appointed general sales manager of the Denby Motor Truck Co., succeeding L. B. Graham, resigned. Herbert is one of the oldest members of the Denby organization, having filled such posts as special field representative, assistant sales manager, and more recently as manager of the company's Detroit branch.

Fred E. Castle, of the Fred E. Castle Co., Detroit, announces the termination, by agreement, of his contract with the Hayes Wheel Co., of Jackson, Mich. Castle is known to

the industry as one of the veteran sales representatives in the motor car equipment and accessory field. He has not made known his plans.

Guy W. Vaughn, who has resigned as general manager of the Van Blerck Motor Co., Monroe, Mich., will be the new vice-president and general manager of the Standard Steel & Bearings Co. of Philadelphia. He will remain as vice-president and a director of the Van Blerck company.

George Stowe, former manager of the New York branch of the Mitchell Motors Co., has been appointed general manager of the Reo Motor Car Co. of New York to succeed James J. Hunt. Stowe was New York manager for the Chalmers Motor Car Co. before going with Mitchell.

C. A. Brownell, former advertising manager for the Ford Motor Co. has returned from a long vacation in California and has assumed his position as vice president in charge of sales, distribution and advertising of the Wildman Rubber Co., Bay City, Mich.

C. P. Flisen of Racine, Wis., has resigned as district manager of the Burroughs Adding Machine Co., to accept the position of district manager of retail sales in Racine and Kenosha counties for the Mitchell Motors Co. of Racine.

Dr. Joseph W. Roe, secretary of the Railway Car Manufacturers Association and executive engineer of the Pierce-Arrow Motor Car Co. of Buffalo, has been appointed professor of industrial engineering of New York University.

J. E. Roberts has resigned as general sales manager of the Cole Motor Car Co. of Indianapolis to become effective October 1. He has not made known his plans.

Mason Tire and Rubber  
Working 24 Hours a Day

AKRON, OHIO, Aug. 17—The Mason Tire & Rubber Co. of Kent, near Akron, has increased its production from 1800 to 2000 tires daily and is now operating on a basis of 24 hours a day. In units, Mason sales are running four to one over the same month of last year, while the month of July showed an increase of 50 per cent over July of last year.

"Production of solid truck tires is heavy and increasing steadily, and owing to the fact that even now consumers and dealers are buying only current requirements, we look for business to hold up steadily throughout August and September and possibly October, which is a distinct reversal of sales conditions of recent years, when the peak has been reached in the spring rather than in the fall," said a company official.

## INSOLVENCY IS ALLEGED

INDIANAPOLIS, Aug. 16—A petition has been filed at Sullivan, Ind., for the appointment of a receiver for the Mutual Truck Co., with a plant in that city. The petitioners are the Electric Steel Co. of Indianapolis and Sherman & Pomeroy, Inc., advertising agents in Chicago. It is alleged that the company is insolvent and that it owes \$85,000. The capital stock of the corporation is \$500,000 and nearly all the stock is owned by residents of Sullivan County.

## BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.

NEW YORK, Aug. 16—As a result of unfavorable weather during July, there has been a material reduction in the estimates of the crop yield published by the Government as of August 1. The wheat crop, both winter and spring, estimated at 757,000,000 bushels, which is now practically harvested, shows a decrease of 52,000,000 bushels from the July 1 estimate, and of 73,000,000 bushels from the last five year average. The estimate of 1,137,000,000 bushels of oats is slightly higher than the July 1 estimate, but 296,000,000 bushels below the five year average.

The yield of corn on August 1 is estimated as 3,032,000,000 bushels against the July 1 estimate of 3,123,000,000 bushels, which may be compared with the five year average of 2,798,000,000. The decreases in the estimates for other grains are in proportion to that of wheat and corn. The decrease in the estimate for potatoes, however, is very large, 316,000,000 bushels on August 1, against 377,000,000 on July 1, but this estimated yield is considerably above the five year average of 271,000,000 bushels. These estimates, as a rule, are much lower than the yields of recent years since war demands stimulated agricultural activity.

Liquidation continues in our financial position at a rapid pace. The report of the Federal Reserve System for August 10 shows a decrease of \$90,000,000 in bills discounted (loans), while bills bought in the open market increased \$15,000,000, making the total bills on hand \$1,570,000,000. Discounted bills held by the Boston, New York and Cleveland banks include \$53,000,000 of bills discounted for the Richmond, Atlanta, Minneapolis and Dallas banks, compared with \$57,000,000 in the previous week.

A decline of \$18,000,000 took place in the deposits of the member banks' reserve account, and \$21,000,000 in Government deposits, which brought total deposits down to \$1,662,000,000. Note circulation declined \$16,000,000 to \$2,520,000,000. Gold holdings increased \$23,000,000, but other reserves declined \$6,000,000, total reserves being \$2,720,000,000. As a consequence of these changes, the ratio of total reserves to deposit and Federal Reserve note liabilities combined increased from 63.7 per cent on August 3 to 65 per cent on August 10, and the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, increased from 83.1 per cent to 84.9 per cent. Since Jan. 1 of the present year, the Federal Reserve Banks have gained a total of \$513,000,000 in gold and lost about \$46,000,000 in other cash reserves.

All classes of money hardened last week, which preceded large Government mid-month financial operations. Call money remained stationary at 6 per cent through the week, with very little activity in the market.

# Calendar

## SHOWS

Sept. 5-10—Indianapolis, Automobile and Accessory Show in conjunction with Indiana State Fair conducted by Indianapolis Automobile Trade Association, John B. Orman, Mgr.

Sept. 28-Oct. 8—New York, Electrical Exposition, 71st Regt. Army, Electric Equipment, Machinery and Vehicles.

Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.

January—Chicago, Automobile Salon, Hotel Drake.

Jan. 7-13—New York, National Automobile Show, Madison Square Garden, Auspices of N.A.C.C.

Jan. 28-Feb. 2—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.

Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville

Automobile Dealers Association.

Sept. 9 to 17—Ottawa, Ont., Can.—Ottawa Motor Show.

Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

September—Buenos Aires, Argentina, Passenger Cars and Equipment. La Pabellon de las Rosas. Automovil Club Argentino.

September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery. Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.

Sept. 5, 1921—Constantinople, Traction trials under the direction of the Turkish Ministry of Agriculture.

Sept. 23-Oct. 2—Berlin, German National Automobile Show, Auspices of German Automobile Mfg. Ass'n and German Automobile Club.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12—London, British Motor Show, Society Motor Mfrs. and Traders.

November 7-14—Paris, Seventh International Exposition of Aerial Locomotion in the Grand Palais of the Champs Elysees, Held by the Chambre Syndicale des Industries Aeronautiques.

March, 1922—Santiago, Chili, Annual Automobile Show.

May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.

Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

Sept. 14-15-16—Detroit, Credit Convention Motor and Accessory Manufacturers Association.

Oct. 12-14—Chicago, Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

Nov. 22—New York, Convention of Factory Service Managers, National Automobile Chamber of Commerce.

Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

## RACES

Labor Day—Uniontown, Pa., Autumn Classic.

## Aircraft Industry Is Sound, Declares Chief

NEW YORK, Aug. 17—J. K. Robinson, Jr., president of the Manufacturers Aircraft Association, Inc., reporting on the condition of the aircraft industry, stated to-day:

"The readjustment of the aircraft industry to a substantial basis, from which it can begin to build a solid and profitable commercial business, has been practically accomplished. The achievement is regarded as unique and should provide considerable encouragement to long established lines in other fields of transportation which have been suffering from temporary depression.

"This year, which has seemingly been marked by industrial depression generally, has witnessed an upturn in the aircraft industry. The 15 or 20 manufacturing plants have been readjusted to a sound operating basis. Experimental engineering has greatly improved the usefulness and safety of aircraft. The thousand or 1200 airplane operators have definite assurance in the President's message, that, before many weeks, an aerial code will be passed, thus giving the entire art a legal status.

"With this constructive legislation actually in sight, the aircraft industry is making renewed efforts to exploit commercial aviation and there is gratifying indication that the public is ready to accept aircraft as an expeditious means of transport supplementing the railway, steamship and motor car, and that forestry, agriculture, mining, banking, photography, surveying, fishing, advertising, etc., will pay liberally for the improved and unique service which the commercial airplane offers."

## Permanent Receiver for O'Bannon Corp.

NEW YORK, Aug. 16—Richard Le Baron Bowen, vice-president and general manager of the O'Bannon Corp., who has been acting as temporary receiver

of the company, has been appointed permanent receiver. The company manufactures artificial leather and rubber fabrics for automobile tops at West Barrington, R. I. It has outstanding \$1,000,000 in common stock and \$494,000 in preferred. It has no funded debt and its present difficulties are due to the general business depression. Dividends on both classes of stock were paid up until last year. The plant and equipment are valued at \$938,749 and trade-marks and patents at \$700,000. The balance sheet as of Dec. 31, 1919, showed total assets of \$5,348,905. T. M. Reynolds of Boston is president of the company. E. V. R. Thayer, New York banker, is one of the directors.

## Willys Subsidiary Changes Directors

NIAGARA FALLS, N. Y., Aug. 17—Four changes in the directorate of the United States Light & Heat Corp., a Willys subsidiary, were made at the annual meeting. The new directors elected were H. I. Shepherd and W. B. Stratton of New York, D. H. Kelly and R. H. VanNest of Niagara Falls. They took the places of J. R. Harbeck, J. A. Roberts, J. A. Smith and C. L. Lane. Lane was a vice-president and general manager. The directors elected Kelly a vice-president and Shepherd was made treasurer in place of H. H. Knapp. John N. Willys continues as chairman of the board. Confidence in the future was expressed in the report submitted by President C. O. Miniger. The financial statement soon will be distributed to stockholders.

## KALAMAZOO SEDAN TO GO ON

KALAMAZOO, MICH., Aug. 16—The stockholders of the Kalamazoo Sedan Co. have voted to continue the business. Sufficient funds will be available to pay all obligations and give sufficient working capital for immediate needs. The plant has been idle for the past four months.

## \$1,500,000 in Notes to Pay Seiberling Debts

AKRON, OHIO, Aug. 17—Under the terms of a \$1,500,000 mortgage recorded here and executed and delivered by the Prudential Securities & Realty Co. to the Union Trust Co. of Cleveland, 1500 \$1,000 notes maturing July 31, 1923, will be issued to liquidate the debts of F. A. Seiberling, founder and former president of the Goodyear Tire & Rubber Co. The Prudential Securities & Realty Co., recently was organized with George Steele of Cleveland as president, and A. W. Cannon of Cleveland as secretary, to act as trustee of the assets and liabilities of Seiberling.

The mortgage negotiated covers Seiberling's real estate, his personal property and his various corporate holdings. The mortgage lists 32 parcels of real estate in Summit County and several in Florida and Michigan, 125,701 shares of Goodyear common stock and 520 shares of Goodyear preferred stock, 9998 shares of stock in the Ladysmith Smelting Corp. of Seattle, Wash.; 3214 shares of stock in the Wellman-Seaver-Morgan Co. of Akron; 1696 shares of stock in the Whitman & Barnes Co. of this city and 1270 shares of stock in the Ohio Savings & Trust Co. The mortgage also lists 2,010,000 lbs. of raw rubber stored in warehouses and said to be pledged to secure the indebtedness of the Newcastle Rubber Co. now reorganized and known as the Lehigh Tire & Rubber Co.

Liabilities of Seiberling's estate are listed at \$6,000,000. According to the agreement between Seiberling and his creditors, the creditors have agreed to extend time of payment on their claims for two years.

## FORD PLANT IN FRANCE BURNS

DETROIT, Aug. 17—A message received by the Ford Motor Co. states that its plant at Issy-les-Moulineaux, a suburb of Paris, has been virtually destroyed by fire with a loss estimated at between 6,000,000 and 7,000,000 francs.

## *Standardization of Product*

Every executive in the automotive industry knows that "standardization of product" is the big essential today.

Motors have been standardized; axles have been standardized; so have transmissions, radiators wheels, even bodies are built to a certain standard.

But automobile body hardware never has, up to the present. It has been necessary to go here for window regulators, there for door hinges, somewhere else for windshields, and so on, constantly changing, constantly substituting and redesigning.

Now, however, it is entirely different. Ternstedt, with its new and immensely greater facilities, is in position to supply hardware equipment *complete* for all automobile body work, permitting the body builder to maintain a *uniform* standard of quality in each and every body built.

Window Regulators, Curtain Rollers, Sunshades, Door Panels, Door Bumpers, Anti-Rattlers, Windshield Wipers, Windshields, Window Sash, Strap Hinges, Concealed Hinges, Piano Hinges, Rear Deck Locks, Rear Deck Hinges, Rear Deck Lid Braces, Screw Machine Products, Channel and Shapes, Die-Castings, Open and Closed Body Door Locks, Other Miscellaneous Automobile Hardware. All Kinds of Stampings.

From the comprehensive Ternstedt line it is a simple matter to choose the *complete* assortment of hardware required for any type of body. In fact, Ternstedt engineers have carefully arranged a series of hardware groups to exactly conform with bodies for either the low, medium or higher priced cars. This service is purely for your convenience and may be entirely disregarded when making a selection, if desired.

Ternstedt Hardware is found as *exclusive* equipment in a large number of the foremost motor cars. Its worth is definitely established and needs no further mention here.

Consider carefully this idea of concentrating your entire body hardware purchases in Ternstedt. Buying *standardized* hardware will save you time, trouble, annoyance and money. Fundamentally right, the idea is good, sound business sense.

## Practical Data Gathered for Use in Selling Cars

N. A. C. C. survey gives facts of special value. Car buyers are chiefly influenced by practical performance features. Here is presented a critical analysis of results and their bearing on present practice.

By Norman G. Shidle

**T**HE need for more facts in connection with car merchandising is gaining recognition throughout the industry. In several instances, individual manufacturers are spending large sums of money and are making extensive efforts to obtain such facts and to correlate and interpret them correctly. The task of analyzing markets and of determining with some degree of accuracy how to sell to them is really only in its primary stages so far as automobile merchandising is concerned.

The interest taken by manufacturers, however, in every recent attempt to analyze the selling situation and to accumulate real merchandising facts indicates that definite progress is to be expected. Perhaps the most important recent effort along this line is the attempt of the N. A. C. C. to learn from car owners what factors influence the owner most in buying a car. More than two thousand replies were received from all parts of the country in answer to a questionnaire which asked the owner to indicate his preferences "in selecting an automobile, in order that the manufacturers may be guided by the advice of the consumer in building and marketing cars."

The general scope of the questionnaire is familiar to manufacturers. It covered the following points:

Appearance  
Appointments  
Comfort  
Economy  
Endorsements  
Endurance

Flexibility  
Hill Climbing  
Price  
Service  
Specifications  
Speed

The owners were also asked to indicate whether or not they were interested in slogans and whether or not their choice was influenced by emphasis upon some special feature, such as axles, engines, etc.

The digested replies give some interesting data upon which to base advertising and merchandising plans. In utilizing the replies for this purpose, however, the scope of the inquiry, its advantages and defects, and its limitations must be carefully considered. The usefulness of the results is unquestioned, however, provided they are used with a proper evaluation of the various factors involved.

The chart shown in Fig. 1, which was prepared by the N. A. C. C., indicates the importance given to the various factors by owners of cars in three price classes. Taking all the replies together it appears that automobile buyers, as typified by those replying to the questionnaire, are more interested in the endurance qualities of the car than in any other

characteristic. Economy of upkeep comes second, while the item of price takes third place.

Then follow in order comfort, appearance, service, hill climbing, flexibility, endorsements, specifications, speed and appointments.

Only a few aspects of this general analysis, however, are of much importance from a merchandising standpoint. Selling a middle priced car involves different methods and different variables than selling a high-priced car or a Ford.

But the great significance of endurance is attested by the fact that each of the three class of owners, as well as all the owners together rate it as the most important in influencing their choice of a car. The majority of men having money to invest in an automobile, whether the sum be \$415 or \$15,000, are chiefly interested in how long the car is going to last. At nearly every other point there is some divergence of opinion in each of the price classes.

This would indicate that greater selling emphasis should be placed upon endurance qualities than upon any others. The value of such studies as this is indicated by the apparent failure of car merchandisers to properly evaluate the various selling points in the past. A casual survey of some forty different passenger car advertisements, for instance, shows that in only one case was endurance the predominant theme, while it appeared as a subordinate point only two or three times.

This example in itself is an excellent indication of the need for some accurate data upon which to evaluate selling points; some standards by which to judge the selling appeal. Such data is not at present available except to a very limited extent. Every intelligent effort to compile such information is a step in the right direction. Exceptional results cannot be expected in a short time, because the accumulation of material of this kind involves the analysis of many human and psychological factors which cannot be readily determined and estimated. Considerable study and experimentation will be necessary before anything like accurate results can be obtained.

But definite, though limited, progress can be expected and can be made in each instance. The N. A. C. C. survey under discussion can be made immediately useful in a merchandising way. To do this, however, the limitations of the survey must be considered and its real scope defined. Then it will be possible to discuss specifically the relation of the results of this survey to past practices and to future methods.

The questionnaire was sent to 20,000 persons picked in blocks from automobile registration lists in every State in the Union. Replies were received from about 10 per cent of this number. The replies, however, were distributed in such a way as to be representative of the country as a whole. Ten per cent of the replies received were from Ford owners.

It was discovered, moreover, in analyzing the returns, that the law of averages began to work rather accurately after the first one hundred replies had been received: that is, the results obtained from the first 100 scattered replies were changed but little in the final returns. This would indicate that the survey represented fairly well a typical cross section of American automobile buyers. This assumption is further strengthened by the fact that one individual car manufacturer recently sent out a similar questionnaire to a different list of owners and the results were almost identical.

On the other hand, too much significance should not be attached to the actual position of the various factors in the list, because the predominance of one over an-

other was so close in several instances as to have little meaning. Returns from 20 States, covering more than 30 makes of cars, on the index basis of 100, for instance, give the following emphasis to the different points:

Endurance .....	15	Hill Climbing .....	7
Economy .....	14	Flexibility .....	6½
Comfort .....	9½	Endorsements .....	6½
Price .....	9½	Specifications .....	6
Appearance .....	8	Speed .....	5½
Service .....	7½	Appointments .....	5

These percentages are for the total group, and are significant chiefly as showing the importance given to endurance and economy in comparison with the other features.

The other factors necessary to consider when using this survey for merchandising purposes are more difficult to evaluate. The psychology of those answering the questionnaire must undoubtedly play a large part, however, in estimating the value of the results. A man does not always know accurately just what things do influence him strongly. Sometimes he is influenced by certain things, because he knows he can take others for granted.

Hill climbing, for example, takes seventh place in the total list. This low place may well be the result of the general opinion on the part of buyers that practically all American-made cars are capable hill climbers so far as average service goes. Such reactions on the part of the man answering the questionnaire must be considered. Then, too, a man does not always act in practice as he states formally he believes in acting.

With these and other similar limitations and variables in mind, the detailed results of the questionnaire can be adapted to present selling problems.

We have mentioned a casual survey of owner advertising of some forty different passenger cars. Though not scientifically accurate, this survey may serve as a typical cross section of present automobile advertising. To compare the points emphasized in these advertisements with the points considered important by typical owners, as shown in the N. A. C. C. survey will be an interesting commentary on present methods.

The matter can best be discussed by price classes as noted previously. Since Ford is the only car in the "below \$500 class," it is hardly worth while to attempt a discussion of this class in the present article. For comparative purposes, however, we may list the influence of the various factors as they appealed to Ford owners. The order was as follows:

	Per Cent		Per Cent
1. Economy .....	17	7. Hill climbing .....	6
2. Price .....	16	8. Flexibility .....	5
3. Endurance .....	15	9. Endorsements .....	5
4. Service .....	11	10. Speed .....	3
5. Comfort .....	9	11. Specifications .....	3
6. Appearance .....	7	12. Appointments .....	2½

The cars in the "over \$3,000" are also limited in number as compared with those in the middle price class as the latter is defined by the N. A. C. C. for purposes of this analysis. It is interesting to note, however, that the owners of this class, which has sometimes been considered largely a luxury class, are more insistent upon endurance than any other group, 19 per cent of those replying placing this quality first.

This high-priced group, moreover, rates economy as of practically the same importance as comfort, a point which apparently has not been fully recognized in the past in merchandising this type of car.

It will be noted, also, that the buyers of high-priced cars place about the same value upon appearance as middle-priced car users. A study of the results in connection with the replies of the owners of these high-priced cars, in fact, indicates that even this wealthy class of buyers is primarily interested in the practical and utility phases of the car they buy.

The results in this class are as follows:

Per Cent	Per Cent
1. Endurance .....19	7. Price ..... 7
2. Comfort .....11	8. Flexibility ..... 7
3. Economy .....10	9. Endorsements ..... 6
4. Appearance ..... 9½	10. Specifications ..... 6
5. Hill Climbing ..... 7½	11. Appointments ..... 5
6. Service ..... 7	12. Speed ..... 5

themselves to general statements concerning quality, wonderful performance, etc., the number in that class would exceed that of any other group. This point in itself is significant.

The replies to the N. A. C. C. questionnaire indicate one fact very definitely. Car buyers are interested in specific things when they consider buying a car. In this middle price class they evidently want to know how long they can expect the car to last and the reasons for such expectations.

The definite way in which the owners checked the N. A. C. C. query shows that they are fully aware of the things to be considered in buying a car. They are not specially impressed with the fact that a car is a "thorobred"; they want to know how long it will last, how

much it costs, and what are its riding qualities. They are not specially interested in being told how beautiful a car is; they can see that for themselves. They want to know what service they may expect from their investment.

It might seem that manufacturers have been dwelling too much on economy features. This is probably not true, despite the fact that economy ranks fifth in the middle price class list. It must be remembered that this survey has just been completed. The recent decline in gasoline prices has doubtless had a psychological effect upon owners. Men in the industry, thoroughly familiar with the petroleum situation, realize that economy of operation is to be one of the big problems of the near future. These facts are not apparent at present, however, to

the general run of automobile buyers; their thoughts are affected more by present price reductions than by thoroughgoing analyses of the gasoline situation.

The emphasis of speed and power which appears in many advertisements is out of proportion to its importance as estimated by the potential buyers. Speed is tenth in the list of buyers' opinions, while hill climbing is eighth. The buyer knows that he can buy practically any car on the market and be assured of enough power to fill all his ordinary transportation needs. As a result, he subconsciously relegates the power consideration to the background in considering a particular car.

Limited classes of the potential buying market, of

The line for middle-priced cars is the most interesting for merchandising discussion. To compare past performance with the standards set up by the results of this N. A. C. C. survey, we may list in parallel columns the relative selling importance of these various factors as estimated (1) by those answering the questionnaire and (2) by the survey of some forty different passenger car advertisements appearing during recent months. The line-up is as follows:

#### N. A. C. C. Buyers' Survey

1. Endurance
2. Comfort
3. Price
4. Appearance
5. Economy
6. Service
7. Flexibility
8. Hill Climbing
9. Endorsements
10. Specifications
11. Speed
12. Appointments

| 6. Endorsements  |                    |
| 7. Comfort       |                    |

Only very general deductions, of course, can be drawn from such a comparison. In some of the advertisements analyzed, for example, it was difficult to determine the predominant note. Many of them claimed perfection for the car in every particular.

If an additional classification had been made to include those advertisements which really emphasized nothing whatever of a specific nature; which confined

Fig. 1—Figures at left of chart represent the order of importance of the twelve buying factors—1 being of first importance; 2 of second importance; etc., i.e. the largest number of buyers placed endurance first. Classification by price class

Fig. 2—Figures at left of chart represent the order of importance of the twelve buying factors—1 being of first importance; 2 of second importance; etc., i.e. the largest number of buyers placed endurance first. Classification by geographical sections

course, is specially interested in exceptional speed and power, but the results of this questionnaire indicate very strongly that this class constitutes only a small part of the total of automobile buyers and owners.

That slogans and catch words have very little effect in selling cars is also indicated by the replies. Fifty-one per cent of those replying said they were not interested in slogans, while 40 per cent failed to reply to this part of the questionnaire at all. The other 9 per cent said they were interested in general motor transport slogans, such as "Drive Carefully," etc.

As regards special features, such as engines, axles, etc., 23 per cent expressed interest in such features, while 48 per cent said they were not. Twenty-nine per cent were non-committal.

The reaction of the owner on this point is specially interesting in view of the extended efforts that have been made to "sell" him along this line. The manufacturer and the dealer, of course, are vitally interested in the qualities and characteristics of the different units which make up the finished product, but the average car buyer is interested chiefly in the performance of the finished car. This fact is emphasized by a re-examination of the list for middle-priced cars.

The buyer of this type of car is interested chiefly in endurance, comfort, price and appearance in the order named—and his interest in economy will be a rapidly growing one. All of these factors effect the performance of the finished product.

There are several interesting points in connection with the N. A. C. C. chart shown in Fig. 2. The answers to the questionnaire were divided according to the sections of the country from which they came and the curves drawn accordingly. For the most part there is a striking similarity of opinion recorded from all parts of the country, but a few definite divergences do stand out. The Pacific Coast States, for instance, think more of appearance than of price, an opinion with which the Southern States seem to agree. The buyers in the Northeastern States agree with the general opinion until it comes to flexibility, which they rate above hill-climbing ability. This group also is influenced more by speed than by specifications.

In the case of the Northeastern States, however, the divergence from the average is scarcely marked enough to be of any special significance in any instance.

The relative importance given to service by the Rocky Mountain States, however, is worthy of note. While service stands sixth in the general average, it is considered as fourth in importance by owners in these States. This may be an indication that service is not up to par in this section, and that special efforts should be made along this line. Data of this kind, at any rate, are valuable in planning selling campaigns for specific territories. As accurate information is accumulated along these lines, the cost of merchandising can be ultimately reduced and one of the big factors of sales resistance overcome.

It would be extremely difficult—and perhaps dangerous—to comment upon the low rating given to endorsements of other owners by the people of the Rocky Mountain States. The Rocky Mountain line also takes a startling jump in rating appointments ninth instead of twelfth as does the rest of the country.

While the results of this questionnaire cannot be taken as final and accurate data concerning the points covered, they can well be utilized as a strong indication of which way the wind is blowing. The features of chief interest to the automobile buyer are rather strongly indicated, and the ineffectiveness of certain types of merchandising effort pretty well established as a result of the analysis. Thus the data accumulated from this questionnaire should be of definite sales value to the industry at the present time, if studied carefully and used with a full understanding of the limitations involved in its gathering and compilation.

Moreover, the significance of the survey as an illustration of what may be done along the lines of merchandising research should be fully recognized. Further data of this kind should be accumulated, correlated and analyzed.

Too much cannot be expected within a short time. Rome was not built in a day, nor can the intricate problems of merchandising be completely solved in a short time, since they involve so many intangible, as well as variable, factors. Immediate benefits can be derived from such research which will do far more than pay for the cost of research, while the ultimate benefits to be derived are very great.

# Crossley Building Chassis with Smaller Four-Cylinder Engine

225 cu. in. engine has several interesting features. Generator and fan are combined in one unit and driven by V-belt from pulley on magneto drive shaft. Convenient adjustment for both hand and foot brakes.

By M. W. Bourdon

**C**ROSSLEY has introduced an entirely new model which is put forward as a lower priced five-passenger to supplement the older four-cylinder chassis, which has a bore and stroke of 4 x 5½ in. (279 cu. in.) as compared with 3½ x 5⅞ in. of the new engine (225 cu. in.).

The new type has block cast detachable L-head cylinders. The usual head gasket is required to serve as a compression joint only, the water joints being made by double V-section rubber rings which are employed between side

passages formed in head and cylinder block, the bulges in the sides of the castings for this purpose being very slight. The cylinder block is separate from the aluminum crankcase, which is divided at the crankshaft center line, the upper half supporting the three bearing counter weighted shaft and having four point suspension from the main frame with integral webs between the arms to eliminate the need for an underpan.

Hollow shaft lubrication is used with a gear-type pump submerged in the oil in the sump and driven by skew gear-

ing from the camshaft on the left. The latter has an adjustable silent chain drive.

The connecting rods are H-section drop forgings. The hollow wrist pins float in the bosses of the cast iron lanterned pistons and in the rod end. Pump water circulation and a tubular radiator are used. The pump is driven by a forward extension of the camshaft. It is bolted to the front face of the distribution casing, but has an external gland.

On the right of the crankcase is the magneto. Its shaft is also chain driven and has the fan driving pulley at its front end. The magneto bracket, driving shaft, sprocket and fan pulley are mounted as a unit movable laterally for chain adjustment. The fan itself is mounted on the front of the armature shaft of the generator which is arranged high up in front of the cylinder block.

The five-jet Smith carbureter is also on the right, fed by the vacuum system and bolted to the flanged face of a transverse passage leading to a detachable manifold on the left, which is arranged close to but not actually in full contact with the exhaust manifold. The latter has its outlet branch at the front end, the pipe to the muffler passing down vertically through a hole in the crankcase web extensions.

Engine and gear-set are separate units. The latter is supported by a short subframe at four points and is connected to the cone clutch (which has a ball bearing pilot) by a coupling shaft with a pair of flexible disk joints. The gearbox has four speeds and is provided with a right-hand lever carried on a bracket extending from the top of the aluminum casing. The gear shafts are carried on ball bearings, but the pilot bearing is of the roller type.

Behind the gear-set is a contracting shoe type brake with face cam actuation. The drum has attached to it the

casing of the enclosed star universal at the front end of the open propeller shaft. The last named is solid and has a sliding block joint at the rear with renewable steel plates in its casing, the phosphor bronze blocks being backed by springs to prevent rattle.

The back axle is a steel casting with integral taper extensions. The detachable rear plate allows the spiral bevel gearing to be easily withdrawn when the driving shafts have been removed. The final drive ratio is 3.57 to 1. Drums for the expanding rear brakes have pressed steel hollow spoked detachable wheels attached to them on the semi-floating axle ends, the hubs running on parallel roller bearings with thrust races. Ball bearings are used to carry the differential. The brake camshafts at their inner ends have side-toothed plates attached to them, engaging with actuating levers having similar teeth at one side of their bosses, this arrangement allowing the angle of the levers to be reset as brake wear occurs, though a service wing-nut adjustment is provided at the ends of the pull rods.

Semi-elliptic springs are used back and front. The worm and complete wheel steering gear has its worm shaft mounted on eccentric bushes for mesh adjustment. Parallel roller bearings and ball thrust races are used for the front hubs, and ball bearings for the swivel pins. Oil cups are used throughout in lieu of grease cups.

The chassis weight is 2070 lb., the wheelbase is 124 in., and the track 55 in. Normal British practice is followed, though in detail it is more of a production job than the larger model which, it may be said, is a pre-war type modified first to meet the requirements of the Royal Air Force—by which it was widely used as a tender—and then remodeled for 1919 and 1920 as a five-seven passenger private car chassis.

## Double Drum Motor Truck Power Winch

**A** MOTOR truck winch designed to take the place of heavy steam hoists in construction work has been developed by the Erie Hoist Co. It comprises two winches on a single frame, with a single drive shaft. The winch is driven from the power take-off on the transmission by means of a chain and sprockets. Installation of the hoist back of the cab is said to be an easy matter. The small drum rope is fastened to the boom, whereby the latter can be raised or lowered to any desired position. When the desired position has been attained, the boom is locked by the ratchet pawl, and it can be held in this position indefinitely with perfect safety, it is claimed. The large drum line serves to handle the load.

This winch can be used for hoisting or pulling in two places, as the two drums are independent. Each drum is equipped with a band brake, ratchet wheel and pawl. The drums are driven through friction clutches of the cone type with double friction surfaces. The worm and

wheel are inclosed in a dust-proof housing and run in oil. A three-speed and reverse transmission can be fitted to this outfit, giving three additional speeds.

With a gear ratio of 42 to 1 the rope speed on the large drum is 34 ft. p. m.; with a gear ratio of 21 to 1, 68 ft. p. m. The drum capacity of the large drum is 1500 ft.  $\frac{3}{8}$ -in. wire rope; 1000 ft.  $\frac{7}{16}$ -in.; 900 ft.  $\frac{1}{2}$ -in. The small drum has rope speeds of 30 ft. p. m. with a gear ratio of 42 to 1 and 60 ft. p. m. with a gear ratio of 21 to 1; its rope capacity is 1100 ft. of  $\frac{3}{8}$ -in. rope, 850 ft. of  $\frac{7}{16}$ -in. rope and 650 ft. of  $\frac{1}{2}$ -in. rope. The rope pull of a single line is 7000 lb.; the weight, 1725 lb.; the space back of the seat, 19½ in., and the height from center of drum shaft to chassis, 19 in.

**T**HE two following publications of the Bureau of Standards, Washington, D. C., have just been released for general distribution: Circular 100, entitled "Nickel," contains 106 pages in which are included an account of the metallurgy, physical properties, effect of impurities, and the characteristics of the commercial alloys of nickel; Technologic paper 188 entitled "White Metal Bearing Alloys at Elevated Temperatures" describes the results of an investigation on bearing metal alloys of particular interest in the automotive industry, the temperatures considered in this investigation running up to 100 deg. C.

# Some Factors Affecting Carbureter Design and Operation

Deductions drawn by a carbureter designer from the results of tests conducted by O. C. Berry at Purdue University, lay stress upon need for enriching the mixture as throttle closes and load decreases.

By W. H. Weber\*

**A** FEW years ago Prof. O. C. Berry of Purdue University conducted a series of tests on "Mixture Requirements for Automobile Engines," the results of which are extremely interesting and important to carbureter designers. Although the results of these tests are not given in the most desirable form for the prospective designer, yet many valuable conclusions may be drawn from them. In fact, it is possible to design an efficient instrument from a serious study of mixture requirements.

Carbureter literature in general is not very enlightening. We are told by the makers that the law of liquid flow prevents the use of the combination of the simple suction controlled fuel and air jets, for the reason that the fuel flows faster in proportion to the air as the suction increases. We are further told of the successful manner in which each manufacturer overcomes this tendency through his special device, the inference being that the perfect carbureter is an instrument which will deliver a constant proportion of fuel and air under all conditions. As a matter of fact, this latter is not true.

There is a certain definite field which represents all conditions which a carbureter must meet. We may indicate the limits of this field by the graph, Fig. 1, in which the line OY represents the load carried from nothing to maximum and the line OX represents the engine speed, also from zero to maximum. The field formed, OYZX, embraces all conditions under which an engine may operate. It is this field which Professor Berry has very conscientiously covered. His tests may be briefly given in résumé thus:

1. Determination of best mixture at 1000 r.p.m., half load, for (a) best power; (b) best thermal efficiency.

\*Engineer, Claudel Carbureter Co.

Fig. 1

Results: Best power secured with .0775 lb. fuel per pound air; best efficiency secured with .063 lb. fuel per pound air. This test considered but one point in the field is marked 1.

2. Effect of speed on mixture requirements at half load, for (a) best power; (b) best thermal efficiency. Results: Best power secured with .0775 lb. fuel per pound air; best efficiency secured with .063 lb. fuel per pound air. The points considered in this test are marked 2.

3. Effect of load on mixture requirements at various speeds, for (a) best power; (b) best thermal efficiency. Results: Best power secured with .0775 lb. fuel per pound air; best efficiency secured with .0775 lb. fuel per pound air, at light loads; .062 lb. at heavy loads.

From test No. 3 we may immediately draw the following conclusions:

First—No fixed air, fixed fuel carbureter can be adjusted to deliver maximum power and operate at maximum thermal efficiency with the same setting.

Second—If such a carbureter be adjusted for maximum efficiency, some extra means must be taken to enrich the mixture for light loads.

Before laying down any rules for carbureter construction let us consider an actual engine in a passenger car. The maximum possible load is represented by the line XZ (Fig. 1). Points along this line will, of course, have different values dependent entirely upon the load the engine can carry at various speeds. Furthermore, this line must represent the maximum possible boundary within which the carbureter must function and is obtained with wide-open throttle, mixture adjusted for best power at all speeds. It is obvious, however, that the engine is not always operating under such conditions in the passenger car; as a matter of fact, we only touch this line when we want a maximum of some sort, such as quick acceleration, heavy pull, high speed, etc. If we now calculate the power necessary to propel the vehicle in which the engine is placed, along a level road with minimum resistance from lowest to highest speed, we can find the load necessary under this condition and plot it in Fig. 1, such as line O'Z. O'Z will then represent the low boundary within which the carbureter must function. Any point in the field below O'Z need not be considered, since the power developed at such a point is not sufficient to produce vehicular motion at that engine speed. We now have a new field, O'ZX, for carbureter consideration.

Professor Berry's test, marked 3, tells us that maximum thermal efficiency requires .0775 lb. fuel per pound of air under light loads and .062 lb. fuel per pound of air under heavy loads; we may draw an arbitrary line, MAP, dividing the field as shown, the region below MAP

representing light loads and above MAP heavy loads. The area O'AM, then, represents that section in which maximum efficiency accompanies .0775 lb. fuel per pound of air, and the area MAZY the section in which maximum thermal efficiency accompanies .063 lb. fuel per pound of air, and the combined area, O'AZYM, that section in which maximum power accompanies .0775 lb. fuel per pound of air. We need not consider the actual figures .063 and .0775, but rather their relation to each other to the extent that one helps to make a lean and efficient mixture, whereas the other helps to make a rich and powerful mixture. Different gear ratios will affect the curve, O'AZ, to the extent that A will move toward M when we lower the ratio or toward P when we increase the ratio, the point being that we need consider only a small part of the field OXPAM.

The following general statements regarding carbureters in actual use may be made: First, during much the greater part of his driving time the car owner is operating his car with the throttle not wide open. The throttle opening scarcely exceeds one-half of the maximum open position. Second, when the driver opens his throttle wide, he does so for a maximum: Maximum speed, maximum power on hills, maximum acceleration from low speeds, etc. Third, he wants good gasoline economy at all times, but he is willing to sacrifice a little in economy for the sake of maximum power during the small portion of time he demands power. On the other hand, during the greater part of his driving he is using only partial throttle opening, and he is willing to sacrifice a little power which he will never miss. These generalizations are rational and allow us to lay down some definite requirements for a carbureter which

will be a so-called "maximum" instrument in so far as we can mechanically make it so.

The fixed air, fixed fuel carbureter may be adjusted for either maximum efficiency or power or for a mean, but never for both extremes. We may then lay down the rule that to make as nearly perfect a carbureter as possible we must start with an instrument capable of delivering a constant mixture of fuel and air at all engine suction. This carbureter will satisfy either maximum efficiency or maximum power conditions in the field MAZY. A fuel jet placed near the throttle—such as an idling jet—so arranged that its flow will gradually diminish as the throttle is opened, will take care of the field O'AM when the carbureter is adjusted for maximum efficiency. Finally, it is desirable to add a mixture quality control to remain fixed for either of two conditions—namely, variable throttle and wide-open throttle. In operation we will be then able to obtain the following results:

Variable throttle (average driving) carbureter adjusted for maximum efficiency. When throttle is in idling position, mixture is enriched by idling jet. As throttle is gradually opened, mixture thins out until point A is reached, when mixture becomes constant until throttle is nearly wide open. The point at which idling jet cuts out may be varied to suit different engines, depending upon the position of point A.

Wide-open or nearly wide-open throttle (maximum demands), carbureter automatically becomes adjusted for maximum power. Idling jet is not in operation, and, since carbureter is capable of delivering a constant ratio of fuel and air, mixture will be set for maximum power throughout the entire range of speed.

## Improved Carbureter on Packard Cars

**T**HE Packard single sixes are now coming through with a two-range or double jet carbureter. Used in combination with the fuelizer, it is claimed that this carbureter greatly increases the gasoline mileage possible with the single six cars. The carbureter is designed to give automatically a mixture to suit the needs of either heavy or light pulling. The new two-stage carbureter is being supplied on all the single sixes at present, and is being provided without charge as rapidly as possible for cars already in service.

The two-stage jet carbureter is designed to give a rich mixture when it is needed and a leaner mixture for ordinary driving. This is accomplished by having two jets. The one for the richer mixture is placed so far above the float chamber level and the throat of the venturi that it will not work during ordinary running, but will respond to high suction from the engine which is created by a heavy pull. Referring to the sectional view of the carbureter herewith, the main jet used for general driving is the annular passage located at the throat of the venturi. The secondary jet is the central tube which extends upward into the mixing chamber of the carbureter above the venturi. This being away from the venturi, naturally the velocity head around it is considerably lower, and consequently the jet is not in operation at ordinary speeds. Furthermore, the jet being considerably above the level of gasoline in the float chamber, it is necessary for considerable pull to be exerted to lift the gasoline from this jet.

When a high vacuum exists in the mixing chamber, as, for instance, when the engine is pulling heavily, or when the velocity head increases to a high degree due to running at extreme throttle openings on a level road, the secondary jet will cut in. It is claimed that a considerable

saving in fuel is effected by the use of this carbureter, and in the testing room at the Packard plant, no engines are being passed until they can show an economy equivalent to 20 miles to the gallon under favorable conditions. The Packard fuelizer, which is put out as standard equipment, is an integral part of this new carbureter.

Sectional views of improved two-stage carbureter used on Packard single six engine

# A French Twin-Engined Armored Biplane

Lioré & Oliver plane is designed to protect pilot and gunners but is relatively light and maneuverable. Rotary engines and duralumin fuselage are employed. Can be operated with one engine disabled.

By John Jay Ide

**I**N designing the Lioré & Oliver armored biplane the principal purpose of the constructors was to fill the need for an airplane that was properly armored and at the same time light and maneuverable. It was not possible to inclose all vital parts in armor, as this would have resulted in a very heavy machine having a ceiling of about 5000 ft. and poor control. The designers were content to protect the pilot and gunner with armor and to use Lanser leak-proof fuel tanks. Rotary engines were adopted on account of the fact that during the war they had made the reputation of running even when hit by bullets.

The fuselage, which is of rectangular section, is constructed entirely of duralumin. A series of tubes forming Warren trusses is riveted to the longerons of the fuselage. The fuselage is calculated to withstand six times the normal load.

The pilot and gunner, who are in one compartment, are protected by steel plates 0.276 in. in thickness, riveted together. The weight of the armor alone is 661 lb. The gunner can either remain in his gun ring or seat himself behind the pilot and take control of the machine. To facilitate this the gun ring is mounted on slides and can be moved backward.

The engines are supplied from a main tank having a capacity of 72 gal., mounted in the nose of the fuselage, and by two gravity tanks in the top wing. All tanks are leak-proof. There is a pump for each of the gravity tanks. If one pump is damaged the other pump can be used for supplying both tanks by turning a tap in the pilot's cockpit. If both pumps should be put out of action the gravity tanks contain enough fuel for half an hour's flight.

A nine-cylinder 180-hp. Le Rhone rotary engine is mounted in a streamline nacelle on each side of the central fuselage. A fairing incases the central part of each propeller and masks most of the engine. Cooling is effected by an opening in the nose of the fairing, which permits air to enter and cool the crankcase and cylinder bases. The exit for the air is past the cylinder heads and also out of the tail of the nacelle. Each engine is held in place by duralumin tubes attached to the interplane struts and landing gear.

The method of truing up the wings is rather ingenious. At the base of each strut there is a system of double

The Lioré & Oliver armored biplane equipped with two nine-cylinder Le Rhone engines of 180 hp. each

screws with opposite threads so that adjustments can be made without any disassembling.

In the ordinary twin engine aeroplane having one power unit on each side of the center line, the stoppage of one engine necessitates holding the rudder hard over in order to keep on a straight course, granting that the machine can fly at all on one engine. In the Lioré & Oliver the angle of the fin is adjustable with reference to the longitudinal axis of the machine. This is accomplished by pivoting the whole stern of the fuselage. As shown in a sketch herewith there is a screw (a) controlled by a cable (b) and a handwheel (c). On this screw moves a bronze nut (d) integral with the fork (e), which forms part of the fin structure. In general a jointed tail does not inspire one with confidence, but in this case the fin has resisted a load twelve times normal.

The stabilizer has a variable angle of incidence and is controlled by a cable and handwheel in a similar manner to the fin. Referring to the sketch, the two halves of the stabilizer (a) and (b), connected by means of a sleeve and conical pins, form with the two tubes (c) and (d), the cross piece (e) and the two tubes (f) and (g) an absolutely rigid structure. The movement of the stabilizer is limited by the slides (h) riveted to the sides of the fuselage longerons. The variable angle of inci-

Diagram showing construction and control device for stabilizer and pivoted stern structure and control mechanism of Lioré & Oliver biplane

dence stabilizer allows the pilot to adjust the angle according to the load. The tail can even be made slightly lifting without danger as the pilot can always bring it back to 0 deg., or to a negative angle if the airplane glides too steeply.

The landing gear has been designed to have the least possible head resistance. Each wheel with its shock absorber is covered by a cowling and the axle is used as a spar for a small wing. The axle is composed of two forks, one sliding within the other. Each wheel cowling forms a mudguard and is quickly removable.

The skid has been designed to avoid fuselage strain. The vertical and horizontal stresses are absorbed by springs in a piston placed in the direction of the resultant of the stresses. The transverse stresses are taken up by leaf springs fixed to the stern of the fuselage to which the piston is attached.

The characteristics of the machine are:

Span .....	47.1 ft.
Length .....	27.2 ft.
Height .....	11.0 ft.
Wing area .....	509 sq. ft.

Stagger of upper wing.....	2.1 ft.
Wheel track .....	13.8 ft.
Weight empty .....	2,866 lb.
Useful load .....	1,322 lb.
Total weight .....	4,188 lb.
Total horsepower .....	360
Weight per sq. ft.....	8.2 lb.
Weight per horsepower.....	11.6 lb.
Speed at ground level.....	114 m.p.h.
Speed at 9,840 ft.....	108 m.p.h.
Climb to 3,280 ft.....	4 min.
Climb to 6,560 ft.....	8 min.
Climb to 16,400 ft.....	39 min.
Service ceiling .....	18,040 ft.
Theoretical ceiling .....	19,680 ft.

With one engine the machine has made a series of figure eight turns without losing height. In this test the full load of 1322 lb. was carried and a horizontal speed of 62 m.p.h. was made.

Without armor the useful load can be increased from 1322 to 1984 lb. That is 47 per cent of the total weight, a high figure for an airplane of this type.

## Poppet Valve Seat Grinding Machine

THE accompanying photographs show two views of a new grinding machine arranged for grinding the seats of poppet valves. The valves are held by a collet chuck which is operated by the lever shown at the side of the work head. The machine can also be furnished with a work head for grinding valve seats on centers. The work head can be set at any angle, to suit the angle of the valves to be ground, and has an automatic movement parallel to the wheel spindle, which can be set to move the required distance for the valve being ground.

The wheel head has a cross movement and is operated by the vertical lever directly in front of it. The hand wheel on the cam bracket is for taking care of the wear

of the wheel. It is provided with a micrometer reading. The lever to the left is for operating the diamond tool for truing the wheel; the lower lever to the left of the cross feed bracket is for stopping and starting the work head. A 3-hp. motor in the base of the machine furnishes the power. The weight of the machine, including the motor, is approximately 2500 lb.

The general construction of this machine is such that it can be arranged for grinding a large variety of small parts in factories where large production is required and the machine can be kept busy on one particular part. The machine is manufactured by the Fitchburg Grinding Machine Co.

Side and top views of Fitchburg valve grinding machine

# Adjustable Spring Shackles Take Up Wear and Prevent Rattle

Two methods employed by well known car manufacturers prevent noise which otherwise occurs when spring shackles become worn. In one case a coil spring automatically takes up side play and in the other an adjustable threaded collar enables convenient hand adjustment.

By J. Edward Schipper

**A** POINT which the majority of designers have overlooked is proper provision against rattle of spring shackle bolts. Experience has shown that on the majority of cars the first point at which rattle begins is the shackle bolt. This is particularly noticeable in a great many cars with the Hotchkiss drive, wear resulting in rattle begins at the spring pivot bolts in the front end of the rear spring.

This bolt receives stresses of a nature which are comparable in some ways to the stresses on the piston pin. It is an oscillating bearing subjected to shock as well as to static load, and consequently subject to rapid wear unless adequately lubricated. The road shocks are transmitted directly to this bolt, and wear is also caused by oscillation due to the deflection of the rear spring. The torque, due to braking the car, and as well as to acceleration, is also absorbed in the Hotchkiss drive through the bolt at the front end of the rear spring.

It is true that the oil cups, or grease cups, or pressure lubricating attachments now employed as stock equipment on up-to-date cars are more accessible at this point than they were in previous years, but even so it is unusual for this bearing to receive proper attention from the owner, consequently it is sure to be one of the most rapid wearing parts on the chassis, and bound to develop a rattle which is especially noticeable over cobble or wood block roads, or other surface which causes numerous small oscillations in the springs.

There are two ways of preventing rattle. One is by a method which automatically compensates for wear, and the other is by making the bearing adjustable. The

Jordan Motor Car Co. has adopted a method by which the shackle bolts are put under considerable spring pressure, thus automatically taking up wear which takes place between the sides of the shackle and the end of the spring eye or shackle bushing. Experimental cars have been driven in the neighborhood of 50,000 miles with this spring device without developing any rattles. The device was first incorporated on the front end of the rear spring where, due to the higher stresses of torque as well as suspension, wear was bound to develop. This proved to be so successful at this point that it has now been adopted for the rear shackles also.

The assembly at the rear spring front bracket differs somewhat in detail from the rear shackle assembly, although identical in principle. Drawings of each installation are shown herewith. A heavy coil spring of 250 lb. tension is fitted between the brackets and the bearing. This is contained in a cup or boot. The earlier installations were housed in a leather boot, but a metal cup has now been substituted. The drawing of the front bracket assembly shows a leather boot construction with a light spring to hold the boot in position. The rear installation has a metal cup, which acts as a dust housing and grease container.

On the front bracket assembly, springs are mounted on each side of the center line, while in the rear the springs are on one side only. This type of installation was made on a trial basis, as it was thought that the spring pressure might cause excess wear rather than prevent it. It has been found, however, that after running the chassis over thousands of miles of all kinds

Rear spring rear shackle assembly on the Jordan car, showing the coil spring installation for taking up wear and preventing rattles

Rear spring front bracket assembly in the Jordan car, showing the eye of the leaf spring between the two 250-lb. coil springs

Adjustable shackle on the Locomobile car. This clamp screw A is loosened and the adjusting washers B can be turned up. These are prevented from turning by the locking pins C

of roads, it has been impossible to detect wear. The coil springs are all interchangeable and are ground to a flat surface for good contact all around.

On the Locomobile car an adjustable collar, which is held in place by a clamp screw, is employed. When wear has occurred in the shackles with this arrangement adjustment can be made by loosening the clamp screw and turning up a threaded collar to another stop on a locking pin, which holds the collar in place and prevents it from rotating. The clamp screw is then tightened, locking the adjustment in place. This brings a new wearing surface into play and brings the shackle into closer contact with the end of the spring acting in a similar way to the coil spring utilized on the Jordan installation.

It is interesting to note the thought that is being given these detail parts, as it is a regrettable fact that we have not been up to European practice in this respect. American design has caught up to and passed European in a great many of the essential features of motor car design at the present time. This has been particularly true of

progress made since 1915, and if serious attention is going to be given to these detailed features, which have a great deal to do, not only with the life of the car, but the comfort of the owner, another step forward will have been made.

There are a number of these small points about the chassis which can be given attention with remarkably welcome results. The small item of spring shackle wear is only a minor problem as compared to many which have been solved, and yet, when no attention is given to this detail, the car is likely to become noisy after 5,000 or 6,000 miles. In some makes of cars it has become noticeable that spring shackle rattles occur after the first three or four thousand miles of driving, and there is no means whatever of removing the rattles except by re-bushing the shackles and probably fitting new shackle bolts.

With the self-lubricating bushings employed in the spring shackles by many manufacturers, some adjustable or compensating device for maintaining tightness at this point will prove a valuable addition.

## A Straddle Milling Machine for Facing Crankshaft Bearings

THE accompanying illustrations show a specialized type of machine for facing the crankshaft bearings of engine crankcases and at the same time milling the oil slinger groove. The bearing caps are removed while this operation is going on. The machine is of the rise-and-fall table type, being loaded and unloaded while at the top of the stroke, when it is in line with the conveyor system. The table is provided with hardened steel jib plates and with locating pins which are raised and lowered by the lever seen in front of machine, so that there is no obstruction to the free entrance and removal of the casting, clamping being done by the hand wheel clamps illustrated.

The cutter mandrel is driven from both ends and supported by bearings between cutters. The table is raised

and lowered by a cam providing slow feed and quick return.

The casting illustrated required eight cutters, all three bearings faced being machined on both sides, and there being an additional cutter for oil slinger groove and a small cutter for finishing the bore of the oil slinger groove. The production of the machine is 25 pieces per hour.

A larger machine of the same general construction is used for the same operation except with the caps in place. Spacing collars to give a variation of 0.002 in. are provided to hold the dimensions of the cutters. Provision is also made so that the rate of feed can be changed according to the use of the machine for cast iron or aluminum.

The straddle milling machine above described is manufactured by the Newton Machine & Tool Works.

Newton straddle milling machine for facing off ends of crankshaft bearings.

## A New Assembled Truck

THE Independent Motor Co. has brought out a new line of three trucks rated at 1½, 2½ and 3½ tons capacity. These trucks are all equipped with standard units including the Continental engine, Zenith carburetor, Eise-mann magneto, Fuller transmission, Ross steering gear, etc. The axles are Shuler in front and Timken rear for the two smaller types and Wisconsin rear on the 3½ ton. All of these trucks are worm driven and the present line is the result of developments by this concern since 1911. The engine sizes are 3¾ x 5 on the 1½; 4½ x 5¼ on the 2½ and 4½ x 5½ on the 3½ ton truck.

The trucks are supplied in chassis form only, the body equipment being optional and extra. The wheelbases for the three models are 148 in. and 160 in. The chassis are all of semi-flexible pressed steel construction with rigid cross-members. The trucks are designed to fill a wide range of transportation service and are being put out by this concern as suitable for mercantile, farming or manufacturing lines.

# The Development of the Roller Chain Drive

An outline of changes which have taken place in the design and construction of chains and sprockets, with special reference to standardization of the roller chain and of a new form of roller chain sprocket tooth which has many advantages over tooth forms employed heretofore.

By G. M. Bartlett\*

THERE was a time when gear teeth were nothing but "cogs" of indefinite form, and the fact that it was desirable to give them a particular shape in order to decrease the noise and increase their wearing qualities, was realized by only a few. It was many years before engineers and university professors discovered that the problems of odontics were of a high order, and well worth the attention of the keenest minds. When such men as Willis, Herrmann, Olivier, McCord, Bilgren and Lewis devoted themselves to this science the result was a succession of advances in the theory and practice of gear design and gear cutting machines which have played a most important part in mechanical history during the last half century. Gear teeth are no longer mere "cogs." Their outlines are curves mathematically determined and accurately cut by highly specialized machine tools; and many a genius has burned the midnight oil pondering over the fascinating problems that have presented themselves in this field.

The roller chain drive is a comparatively new mechanism and is still in its infancy. The exploration of the field of its possible applications has scarcely begun. A scientific study of the kinematics and dynamics of the chain drive has been pursued by but few men up to the present time. The literature on the subject is very meager, and while it cannot be said that the problems yet to be solved in the design of sprockets are of the same nature or as varied as those connected with gearing, they are as real, and they certainly require a type of analytical mind found more often among university professors than among practical engineers.

The chain drive belongs to that class of mechanical movements known as power transmission machinery, and it belongs to that particular sub-class designed to transmit power between two *rotating shafts*, and to that still more restricted sub-class confined to the transmission of power between two parallel rotating shafts. In accomplishing this result it is usually desired that the angular velocity ratio shall be maintained as nearly constant as possible.

The problems of transmitting power between two parallel rotating shafts and maintaining a uniform angular velocity ratio has been solved in four ways: (1) by the parallel crank mechanism, as in locomotive drives, (2) by flexible belt drives, (3) by spur gears, and (4) by chain drives. The parallel crank mechanism is applicable only to cases where the velocity ratio is 1:1.

The belt drive is applicable to cases where the center

distance is necessarily great, where noise is objectionable, and where a positive drive is either not necessary or not desirable. The spur gear drive is applicable to cases where the center distance is short, and where a positive drive and a very close approximation to a uniform angular velocity ratio is desired.

The chain drive is applicable to a variety of center distances between that required by spur gears and that required by a belt drive. It may be as noisy as gears or as quiet as a leather belt drive, depending upon the installation, the speed, and the type of chain used. The angular velocity ratio is constant for entire revolutions, and for parts of a revolution corresponding to the passage of a whole number of teeth; but there is usually a slight deviation from uniformity during the passage of a single tooth. The one exception to this being the case where the velocity ratio is 1:1, and the center distance is an exact multiple of the pitch. While it is desirable that sprockets should be in accurate alignment the drive will perform very satisfactory service when the two sprockets do not lie exactly in the same plane. Advantage has been taken of this flexible feature in connection with final drives for trucks and tractors, and formerly for passenger automobiles, where the chain accommodates itself very nicely to the sprocket misalignments which vary with the contour of the road or of the plowed field.

The action of a chain and sprocket is not like that of an ordinary belt and pulley. But if we conceive the pulley to be a polygon with as many sides as there are teeth in the sprocket, the comparison will be more nearly correct. The action of a chain as it travels over a sprocket with 8 teeth may be compared with the action of a non-slipable belt traveling over an eight sided prism. The action would not be as smooth as if the prism had 16 sides, nor would the action about a 16 sided prism be as smooth as that about a 40 sided one. This is the reason that sprockets with less than 12 or 14 teeth are usually discouraged by chain drive engineers.

The conditions which cause fluctuations in angular velocity are illustrated in Figs. 1 and 2; and the remedy is shown in Fig. 3, where the center distance has been so adjusted as to cause the rollers A and B at the two ends of the straight portion of the chain to rise and fall in unison. This condition may be stated as follows:

Maximum uniformity in angular motion, and hence maximum efficiency, requires that the span of the tight side of a chain must be an exact multiple of the pitch.

Actual efficiency tests have shown that in a drive in which 14 toothed sprockets were used the efficiency was increased 5.6 per cent by changing from 30¾ in. centers to 30 in. centers, the pitch being 1¼ in. The same experi-

\*Slightly condensed from a paper presented at the Fifth Annual Meeting of the Gear Manufacturers' Association. The author is connected with the Diamond Chain & Mfg. Co.

Fig. 1—Old tooth form. Pitch of chain too small. Proper action on follower impossible. Pitch line clearance greater than necessary for driver. Fig. 2—Old tooth form. Chain pitch length too great. Clearance not sufficient. Fig. 3—Old tooth form. Chain elongated. Clearance ample. When roller No. 1 is released No. 2 comes against the tooth with a snap. The motion of the sprocket will be jerky

ment performed with sprockets having 64 teeth showed an increase in efficiency of one-half of 1 per cent.

The following table shows the variations in angular velocity for various combinations of teeth and indicates the importance of avoiding sprockets with a low number of teeth as well as the effect of an adjustment of center distance:

Per Cent Variation of Angular Velocity with Change in Number of Teeth on Driving Sprocket

	6	9	14	21	30	45
Teeth on Driven Sprocket						
6	00.0 33.3					
9	8.5 22.9	00.0 13.2				
14	12.6 18.4	3.7 9.1	0.0 5.2			
21	14.3 16.6	5.3 7.5	1.5 3.6	0.0 2.0		
30	14.8 16.1	5.8 7.0	2.0 3.1	0.4 1.5	0.0 1.1	
45	15.2 15.7	6.2 6.7	2.3 2.8	0.7 1.3	0.3 0.8	0.0 0.5

The upper figure represents the percentage of variation in the angular velocity of the driven wheel when the span of the chain is an exact multiple of the pitch. The lower figure represents the percentage of variation when the span is an odd multiple of one-half the pitch.

Formula:

For upper figures—

$$100 \left\{ \frac{\cos \frac{180^\circ}{N}}{\cos \frac{180^\circ}{n}} - 1 \right\}$$

For lower figures—

$$100 \left\{ \frac{1}{\cos \frac{180^\circ}{N} \times \cos \frac{180^\circ}{n}} - 1 \right\}$$

Another method which has been used to counteract the variations in angular velocity due to a low number of teeth is the use of the so-called "equalizing gears" which consist of an elliptic pinion driving a gear whose pitch line contains as many waves as there are teeth in the attached sprocket.

Hans Renold of Manchester, England, is probably the father of the chain drive and the Nestor among chain manufacturers. So far as we are able to learn the first practical application of the chain drive was to the propulsion of bicycles and tricycles; and the first factory for the manufacture of chains was built in 1879 by Hans Renold at about the time the so-called "safety" bicycle began to supersede the high wheel. The type of chain then used, and still used to-day to some extent, was the *block center type*, consisting of a series of "B" shaped blocks which form the center links of the chain, these blocks articulating with side links by means of pins passing through holes in the blocks, and riveted to the side plates.

This chain was modified at a later date by substituting two rollers and two bushings for the solid center-blocks, thus forming a *twin roller chain* which could operate over the same sprockets, and which has been supposed to be

much more efficient than the solid block type.

The *standard type of roller chain* as used to-day differs from the twin roller type in that the pitch of the inside links is the same as that of the outside links, instead of being related as 6:4.

This allows a sprocket tooth for every chain link instead of one tooth for every two links, and the action is somewhat smoother.

In adapting the roller chain to drives other than the bicycle it is necessary to make a decided advance in design in order to meet the new requirements with respect to load carrying capacity and high speed. Parts had to be greatly strengthened without an undue increase in weight. This necessitated the use of alloy steel in pins; and where special conditions require it, as in the motorcycle, alloy steel is also used for rollers and side plates. The motorcycle chain is now the most highly specialized and the most carefully designed of all types of roller chains; the reason being that the power to be transmitted requires a very strong chain, while the high speed forbids a heavy chain. It is necessary then to keep the tensile strength high, the pitch short, and the weight low.

In the early years of the passenger automobile many cars were chain driven, and it was not until about 1911 that this type of drive practically disappeared from motorcars as a final drive. The main reason for abandoning it was the objectionable noise. Motor trucks and farm tractors use the chain drive to a considerable extent, and for trucks of over 3½ tons capacity it is undoubtedly the most efficient and effective of all types of final drive at present in use.

While formerly the chain business depended almost solely upon the automotive industries for its existence, this is no longer true, as the chain drive has found applications in hundreds of fields where belts and gears were formerly used.

With the increase in the variety of applications of chain drives there came a demand for a great variety of designs, until, about four years ago, one chain concern found itself with upwards of 130 models of various pitches, widths and roller sizes, exclusive of the many special chains for particular applications. A study of the situation showed that all practical requirements could be satisfied by reducing the total number of regular chain models to less than thirty, and standardizing with respect to the essential dimensions.

In 1917 the Council of the American Society of Mechanical Engineers appointed a committee on the Standardization of Steel Roller Chains, which held its first meeting on Sept. 14 of that year. Shortly afterward the Society of Automotive Engineers appointed a Roller Chain Division for the same purpose. These two committees held a joint meeting in December, 1917, since which time all of the work of the two committees has been co-operative.

Shortly after the first meeting in New York the British chainmakers formed themselves into an organization known as the Association of British Driving Chain Manufacturers, appointed a permanent secretary resident in

London, and immediately began the work of standardizing chains and sprockets. The British and American Committees corresponded for some time with a desire to arrive at common standards, and while not successful in reaching an agreement on all points, the approved standards of the two countries are the same in most cases, and where differences occur they are not sufficiently great to prevent American chains from operating over British sprockets.

Last year the Sprocket Committee of the American Gear Manufacturers' Association was invited to join the others in the work of standardizing a sprocket tooth form, and this committee met with the others at their last meeting in New York City.

The purpose of chain standardization is threefold:

(1) Interchangeability of chains of different makes on the same sprockets.

(2) Interchangeability of connecting links and spare parts.

(3) Reduction in the number of models, and hence reduction of costs.

The purpose of standardizing the sprocket tooth form is:

(1) To put the stamp of disapproval on tooth forms of the old type which provided for excessive pitch line clearance and encouraged hooked teeth, noise, and undue wear on the chain.

(2) To reduce the number of different types of sprocket cutters now being made by putting the stamp of approval of the engineering societies on one type which conforms to principles of good practice.

In order that roller chains of different makes may be interchangeable on the same sprockets it is necessary that

Fig. 4—Action of new chain on undersized sprocket. Fig. 5—Action when sprocket is cut too large, or when chain is too short

the pitch, the width, and the roller diameter should be standardized. And in order that connecting links shall be interchangeable on chains of different makes it is necessary that the pin diameters and the thickness of the inside plates should be standardized.

In order to bring about the standardization of these five dimensions the committees first adopted standard of reference, for each dimension in the shape of a formula, and endeavored to make the new standards conform to this as closely as existing practice would permit. These standards of reference were as follows:

**Pitches:**  $\frac{3}{8}$ ,  $\frac{1}{2}$ ,  $\frac{5}{8}$ ,  $\frac{3}{4}$ , 1,  $1\frac{1}{4}$ ,  $1\frac{1}{2}$ ,  $1\frac{3}{4}$ , 2,  $2\frac{1}{2}$ , 3, 4 in.

**Roller Diameter** =  $\frac{5}{8}$  P.

**Widths**, (defined as the exact distance between the inside plates) =  $0.41$  P and  $0.61$  P.

**Pin Diameter** =  $\frac{1}{2}$  roller diameter.

**Thickness of Inside Plates** =  $\frac{1}{8}$  P.

The standard proportions actually approved differed from the above in a few cases where present well established practice naturally had the preference over considerations more strictly classed as ideal.

In addition to the heavy series of roller transmission chains adopted by the S. A. E. a medium weight series has also been approved in which the same sizes of rollers, bushings and pins are used as in the heavy series, but assembled with lighter side-plates of the next higher pitch.

Thus a medium weight  $1\frac{1}{4}$  in. P chain would be  $\frac{5}{8}$  in. wide and have rollers  $\frac{5}{8}$  in. in diameter.

A study of chain and sprocket action during recent years has led to the discovery of some important facts:

(1) A light weight chain is more efficient than a heavy one.

(2) A chain drive is more efficient under a heavy load than under a light one.

(3) Increasing the number of teeth in the sprockets increases the efficiency.

(4) A chain drive is more efficient when the small sprocket drives the large one than vice versa. This is true also of gears.

(5) Other things being equal, increasing the pin diameter decreases the efficiency.

(6) Removing the rollers from a chain makes almost no noticeable change in the efficiency.

(7) High chain velocity is not as destructive to the drive as high sprocket speed.

Roller breakage is usually caused by high sprocket speed.

The maximum number of revolutions per minute that it is advisable to run the smaller sprocket is

$$\text{Max. R.p.m.} = \frac{2000}{P} \sqrt{\frac{L \times D}{W \times P}}$$

Where  $P$  = pitch;  $L$  = length of roller;  $D$  = diameter of roller;  $W$  = weight of one foot of chain. The constant 2000 was determined from tests.

(8) The design of the sprocket tooth affects the amount of noise and wear on both sprocket and chain. The old style sprocket tooth form so long in use in this country is rapidly giving place to one or another of the newer types which have been developed during the last eight or ten years.

The essential difference between the old and the new types is in the provision made for an elongated chain. Every chain begins to elongate as soon as it is put into operation. This elongation, due to the wearing of the rivets and bushings, continues as long as chain is in use.

To provide for this continual lengthening of the pitch the tooth gap in the old style sprocket is cut with clearance on the pitch line, thus allowing the rollers on an elongated chain to creep around the pitch circle without interference with the backs of the teeth. The result of this is that the whole load is carried by one tooth at a time; and when the load is transferred from one tooth to the next the chain comes against the new tooth with a snap, making the action jerky.

In the newer type of sprocket tooth the pitch line clearance is eliminated, and at the same time the angle of the tooth gap is increased so that when the chain begins to elongate the rollers will tend to climb the teeth a slight amount. The result of this is that the load is distributed among a number of teeth, the action in transferring the load to new teeth is smooth and quiet, and the tendency of the teeth to wear hook-shaped is greatly reduced. (See Figs. 4 and 5.)

The principle of this new tooth form brings up the subject of *pressure angles*, and the questions as to what pressure angle is best, and whether the same pressure angle should be used for a small number of teeth as for a large number. British chain drive engineers have decided in favor of a constant angle of tooth gap (space angle) of 60 degrees and a consequent variable pressure angle which is determined by the formula

$$\text{Pressure Angle} = 30^\circ - \frac{180^\circ}{N}$$

This gives 28 deg. for a 90 toothed sprocket and 0 deg. for a 6 toothed sprocket.

In the United States this system has not met with much favor, as it does not allow sufficient pressure angle for a low number of teeth. One system which has been widely used in this country for the past seven years employed a uniform pressure angle of 30 deg. for all numbers of teeth with excellent results.

During the past year the standards committees of the A. S. M. E., the S. A. E., and the A. G. M. A. have taken up the work of designing a sprocket tooth and a set of sprocket cutters which have been recommended for adoption as an American standard. This tooth form, as it now stands, is designed to combine the desirable features of the Renold, the Diamond, and the Link-Belt types. The pressure angle is 11 deg. for 6 teeth, increasing to 15½ deg. for 9 teeth, and to 24 deg. for 100 teeth. The salient features of the new standard tooth outline (Fig. 6) are as follows:

(1) A seating curve, consisting of a circular arc whose diameter is  $1.005 D + 0.003$  in. ( $D$  being the nominal diameter of the chain roller.)

(2) A working curve whose radius is 1.3 times the diameter of the chain roller and which is concave to the roller.

(3) A straight line portion.

(4) A topping curve which brings the tooth approximately to a point.

The object of making the working curve concave to the roller is to produce a softer contact between roller and tooth and to reduce the rapidity of wear.

Five cutters will be required to cut a range of sprockets from 7 teeth to infinity, graded as follows: 7-8; 9-11; 12-17; 18-34; 34 and over. Each cutter is based upon a number of teeth intermediate between the highest and lowest number to be cut, and the topping curve is such as to form a pointed tooth for the largest sprocket of the group, and a slight flat or "land" for others.

The outside diameter of sprockets are to be calculated from the formula

$$\begin{aligned} \text{Outside Diameter} &= \text{Pitch Diameter} + P \left( 0.7 - \tan \frac{90^\circ}{N} \right) \\ &= (\text{Approx.}) P.D. + P \left( 0.7 - \frac{1.592}{N} \right) \end{aligned}$$

The action of a chain running over sprocket teeth of

Fig. 6—Design of proposed American sprocket tooth

the new design is approximately as follows: When the chain is new and the pitch of the chain is exactly equal to that of the sprocket, all of the rollers will be seated. The load will be distributed among somewhat more than half of the teeth in mesh, with the greatest pressure on the first tooth, and the pressure on the succeeding teeth decreasing approximately in geometric progression until a point is reached where the slight pull on the slack strand of the chain produces a balance, and the pressure shifts to the opposite sides of the teeth. The pressure on the first tooth is

$$\frac{T \sin \frac{360^\circ}{N}}{\sin \left( 31^\circ + \frac{27^\circ}{N} \right)}$$

For an 18 toothed sprocket this formula gives a pressure of 63 per cent of the chain tension on the first tooth, 38 per cent on the second tooth, and 23 per cent on the third tooth, etc.

When the chain has elongated from wear there will be one and only one roller which will actually be seated at the bottom of the tooth space. This is called the "bedding down" roller. From that position the chain rollers take higher positions on the successive sprocket teeth in each direction, and in so doing not only distribute the load among a number of teeth, but also distribute the wear on the acting faces of the sprocket teeth and thus reduce the tendency to form hook-shaped teeth.

## A Ringless Piston

A PISTON which is said to have worked satisfactorily without rings is now undergoing tests calculated to determine its value for general automobile use. The piston, shown in the accompanying cut, consists of two parts, a central casting which includes the head and piston pin bosses, and a shell of cylindrical shape which forms the bearing surface in contact with the cylinder wall. The two parts are connected by a thread. The shell, it is

claimed, has no tendency to go out of round under the influence of heat and, according to those interested in its development, shows no sign of leakage when made with 0.003 to 0.004 in. or more clearance. The oil film, it is said, maintains the necessary seal. The head of the piston is made either convex or concave to minimize change in diameter with change in temperature. The piston is made by the Ringless Piston Co., Inc.

Tisler ringless piston

ACCORDING to Arthur Williams of the New York Edison Company, there are 52,128 commercial vehicles registered in the New York Metropolitan District, and 30,356 are on Manhattan Island and in the Borough of the Bronx. During the year 1920, the number of commercial vehicles in these two boroughs was increased by 6,000. There are 9,157 electric commercial vehicles in the country, of which 5,000, or about fifty-two per cent, are in the Metropolitan District. During 1920, 536 were added, or something less than ten per cent of the total of motor vehicles added here that year. It is estimated that 30,000,000 kilowatt hours are now sold annually in this territory for vehicle charging from which revenues of between \$750,000 and \$1,000,000 are now derived.

# Defining the Elastic Limit

The term "elastic limit" is used in more than one sense by various engineers. From a practical viewpoint it should mean the limit at which the proportional elasticity ends and the unproportional elasticity begins.

By William Ernest Dalby\*

THE difficulty of defining the elastic limit is due to the fact that the term is used in more than one sense by engineers. Without traversing the various uses of the term, it will be generally agreed that the term elasticity, in its broad sense, means the power of a material to recover its primitive form after loading has been applied and removed. Recovery may be partial or complete. The power of complete recovery is lost when the stress produced by loading has once passed beyond a certain limiting value peculiar to the material.

Below this limiting stress the extension of a steel test-piece is proportional to the load producing the extension. Above this limiting stress the extension increases at a greater rate than the load. This limit, therefore, is called the limit of proportionality, and the term elastic limit is often used to define this point. This use of the term, the most general one, would seem to convey that the elastic power of the material is exhausted when once the stress has passed beyond the elastic limit, and the material has passed into a plastic state. This is by no means true. The material possesses elastic properties right up to the instant of fracture.

If a test-piece, loaded nearly to the point of fracture, is watched in the testing machine, and the load is quickly removed, the test-piece will spring back and to all appearances behaves as a perfect spring. Definite measurement shows, however, that the relation between stress and strain is unproportional. The test-piece shrinks toward its primitive dimensions unproportionally and fails to get to its primitive dimension by the amount of the permanent set. I have used the term unproportional elasticity to describe the state of the material in these circumstances.

To illustrate this point and some others, I throw on the screen a diagram, taken automatically in one of my recorders. The test-piece was new material and in the proportionally elastic state. Starting from zero the spot of light moved along a straight line to the point marking the limit of proportionality. The line then bent away and then the material yielded. The inner state of the material alters as the stress passes through the limit

of proportionality. One state merges into the other.

If the loading be stopped at any point after this limit has been passed, and then removed and afterward reapplied, the process involves the doing of work on the inner structure of the material, and the record of the process is a loop, the area of which represents the work done. The curved boundaries of the loop record the act that in reloading the strain increases at a greater rate than the stress. And in unloading the material shrinks at a greater rate than the reduction of the load. The first elastic hysteresis loop described by the process of unloading and reloading is the first step toward the breakdown of the material by fatigue.

From a practical point of view, therefore, the term elastic limit should mean the limit where proportional elasticity ends and unproportional elasticity begins. Unloading from any load below this limit and reloading can be done without describing a hysteresis loop. Unloading and loading, once the limit has been passed is always accompanied by an elastic hysteresis loop.

I illustrate this by a few lantern slides of diagrams I have taken from various materials.

Diagrams of this sort provide new data for the engineer from which to estimate the quality of the material. The new data are the area of the loops and the rate of increase of area. I have taken a succession of loops on several materials up to the point of fracture, and find that the area increases at first rapidly in some materials and then tends toward a limiting value. A typical instance of this is shown in Fig. 1, herewith.

Inner structure and elastic limit are mutually dependent. The microphotograph [not reproduced] of the inner structure of a piece of mild steel containing about 0.13 per cent carbon, shows the blocks to be of enormous size. The L. E. diagram corresponding to this shows the low yield-point, and therefore low elastic limit of 9.2 tons per square inch. The material was suitably heat treated to refine the structure, and then the yield point leaped up to 18 tons per square inch.

High elastic limit steel is produced by heat treatment designed to refine the inner structure. The temperatures refining the heat treatment are not obvious of the same for all steels, in fact each steel requires special investi-

\*Condensed from a paper presented to the Institution of Civil Engineers by Prof. William Ernest Dalby.

Elasticity diagrams of different kinds of steel

gation of its thermal properties by means of cooling curves to find the regions of the necessary temperatures.

I should like to refer briefly to one point in conclusion. Proportional elasticity is destroyed by overstrain. A diagram illustrating this condition is reproduced in Fig. 2. The term overstrain means that the material has been loaded to the extent required to pass it into the condition of unproportional elasticity.

The behavior of irons and steels differs after overstrain. It is known that iron and soft steels tend to recover their property of proportional elasticity by mere lapse of time. And the state is reproduced in very short time by moderate heating as, for example, by mere boiling in water. But the hard steels and the alloy steels do not share this property. After overstrain they remain in that state without recovery indefinitely, and recovery can only be brought about by heating to high temperatures.

I cite one example. The material is nickel steel, the curves being shown in Fig. 3 herewith. The elastic line

of a fresh test-piece is shown at A. The piece was stretched 2 per cent and then a diagram taken, line B. The curvature shows a state of unproportional elasticity. Line C was taken after stretching to 6 per cent. Line D is a repetition test after a rest of 24 hours. In another test the lapse of time was one year. But in this example there was no restoration of proportional elasticity. Line E the diagram after boiling the piece in water—no effect. Line F taken after heating the piece to 550 deg. C. in a muffle for an hour. The elasticity recovery is perfect.

These few remarks will, I hope, show that the exact definition of the term "elastic limit," is a matter of some difficulty, because of the current use of the term in several cases. The term limit of proportionality may be used for the exact definition of one point in the load extension diagram, without interfering with the present uses of the term elastic limit. The limit of proportionality of a material is not a fixed point, but varies with heat treatment and vanishes with overstrain.

## European Tire Construction

**M**ICHELIN has just placed on the market a cord tire with steel studded band which appears to be the only one of its kind. During the past two years there has been a remarkable change in European tire construction, practically all makers having taken up the cord type, and as a consequence steel studded treads are used only on a very limited scale. In some quarters it has been claimed that the steel studded tread was destined to total extinction.

Michelin considers that the use of the steel studded tread should be encouraged, and has developed a metal non-skid with the cord construction. The tire is a development of the rubber tread cord tire known as the cablé which was brought out about two years ago. In the new type of tire the aim has been to combine all the advantages of the cord construction with the practically unpuncturable features of the steel studded tread. With a view to increasing the non-puncture qualities of the tire, the steel studs are made much broader and flatter than on old type steel studded tires. With a tire of this type there is a 90 per cent guarantee of the tire being used down to the cords without an accidental puncture by metal or loose stones. This is particularly advantageous on French roads which, while being fast, are often strewn with loose stones capable of going through an all-rubber tread. The cord tire with steel-studded tread sells at a price about 10 per cent higher than that of the same type with rubber tread.

The steel studded tire is excellent as a non-skid under

all conditions except dry granite sets, and it is for this reason that in the past the European practice was to use a steel-studded tread staggered on front and rear. Experiments have shown that when cars are fitted with four-wheel brakes there is no skidding on granite sets, and it is therefore possible on such cars to use steel studs on all four wheels, thus getting non-skid qualities under all conditions, together with a big guarantee against accidental puncture and the longer mileage of the cord compared with the fabric type. There are indications that in France at any rate there will be next season a sufficient number of cars with four-wheel brakes to make the use of steel-studded treads all-round quite a common practice.

The Pirelli Company of Milan, Italy, has just brought out a straight-side cord tire for racing purposes and made use of it for the first time on the Ballot cars in the French Grand Prix. No announcement has been made regarding the placing of this tire on the open market.

## An Engineering Employment Service

**T**HE wide and varied field of engineering activity has created the need of a clearing house of engineering services from which engineers of any specific qualifications may be obtained. In recognition of this want, the Federated American Engineering Societies, representing a combined membership of about 50,000, has established at 29 West Thirty-ninth Street, New York, an employment bureau for engineers of every variety of training and experience.

Applicants must be members of one of the Societies and submit a complete educational and professional record which is carefully classified, so that as the special requirements of any position are received, the records of men of suitable qualifications are submitted for consideration. The relatively large number of men with whom the Bureau is in touch, the comprehensive classification of records, and the fact that the services of the Bureau are free to employer and member alike, renders possible the selection of the right man for the services required. Negotiations may be confidential if desired. The Bureau will welcome inquiries from those seeking to build up or expand their engineering organizations.

# Minimizing Waste in the Handling of Lumber

A practical analysis of factors tending to cause deterioration of lumber and loss of time and money in handling, drying and storing this material. Causes of decay and the effects of improper drying, etc., are discussed.

By E. E. Collison\*

**T**HE necessity for cost reduction in all lines of manufacture makes it imperative that waste be eliminated, or at least reduced to a minimum. As wood is a large item in the cost of automobiles, it is well to look more carefully into our equipment for handling and caring for this material. Few manufacturers have really competent men to handle this end of the business.

Probably the greatest loss to the average woodworking manufacturer to-day is in the handling of the wood stock from the time it arrives at the factory until ready to be started through its course to the final finished product. The woodworking shop is often the last to adopt modern machinery and correct machine layout.

The cost of wood has risen until stock which would not have been considered at all a few years ago (such as poplar, gum, jack pine, etc.) is eagerly sought to-day, due to the prohibitive prices of the higher grades of stock and to the fact that the forests of the country are rapidly being depleted. There is good reason to install modern machinery and to make the stock pass through the proper machine at the proper time and in proper sequence. This eliminates the waste of time and labor which was formerly occasioned by moving stock back and forth during the process of manufacture. Instead of the slow processes and crude machines used heretofore, we find high-speed, heavy-duty machines doing the work.

The intention of this article is to show that there is need to concentrate efforts to eliminate waste in the yard and dry kilns.

## Unnecessary Handling of Stock

Stock is frequently handled first from the car to the wagon; second, from wagon to pile; third, from pile to wagon; fourth, from wagon to dry kiln; fifth, from the dry kiln to the dry storage, and sixth, from this storage to the cut-up plant. This procedure is all preparatory to starting the stock through the modern plant. Is it any wonder that the cost of getting the stock ready is high?

It is doubtful whether the cost of these several handlings is greater than the loss due to improper care of the stock for the reason that the ordinary wood man does not understand the substance with which he works. The need to-day is for technically trained men in these positions. We see stock coming from the yard with stains (such as blue sap stain, mildews and other dry rots), and yet, by some it is believed that this sort of thing always has been and always will be; hence, a fixed charge is put against this loss.

Any form of decay is caused from bacterial life or a fungus that thrives under certain conditions, but can be checked to such an extent that it becomes dormant. Bac-

teria increase under certain favorable conditions, such as proper warmth and moisture, hence the fungus is noticed more at one season of the year than at another.

The increase of life of any form of bacteria is effected by the propagation of spores or individual units. The spores are spread from one place to another by some carrying agent such as wind and water. Each spore of a form of bacteria contains all the elements which, when put under proper conditions, carry on the life and spread the fungus.

The spore lodges on a certain board, for instance, and as the three proper conditions, moisture, warmth and a slight amount of aeration, are at hand, life begins. The spores send out tubes or arms which thrive on the wood substances, such as starch, sugars, etc., until the very life is eaten from the wood, and eventually the stock becomes fine dust or powder, held together by a mere shell, with little strength left. As the arms spread out and increase, they at times come to the surface of the board at various places, and at these places spores are again formed, which are transported to adjacent boards, or further away, by the carrying agents. This is especially noticeable in hard and soft maple and elm. The process is similar to that which results from placing a rotten apple in a barrel of good, sound fruit.

It is evident that the fungus or disease is propagated by the spore, and further that, if the spore can be killed off or prevented from spreading, the disease can be controlled. This can be and is being done. The slight expenditure required to stop this form of life will result in big returns.

It is far easier to prevent the growth or life of the fungus than it is to eradicate the spores after they have been formed.

## Proper Yard Storage

If the stock is piled in the yard, the piles should be placed on piers made of a substance that will not itself become infected, such as concrete, stone, or brick. The tops of the piers should be 1½ or 2 ft. above the ground level, to allow ample circulation under the pile, in order to keep the lumber dry. Lumber should be piled on a high, dry spot or on well drained land, so that the ground does not cause the air to become moist or heated.

All infected pieces of lumber should be burned or segregated from the good stock, to prevent spread by contact. All loose chips and boards lying on the ground, or in favorable life conditions for the spore, should be raked up and burned. In other words, the yard should be kept clean.

Some mode of covering should be used—either a good shed or good cover boards, with the pile built on a slant, so that the rain will run off quickly and not drip on stock lower down in the pile. The pile should be built so that the ends of the boards are not exposed to the direct hot rays of the sun which cause a rapid drying of the exposed

\* Works Engineer, General Motors Co., St. Louis.

ends, and result in end checking by the subsequent shrinking of the stock at this point.

In all cases weeds should be cut down and all other conditions which prevent ample circulation under the pile should be corrected. The bottom of the pile should not be allowed to come into contact with the ground.

A good practice, found in many well-kept lumber yards, is to spread from 2 to 6 in. of cinders over the whole space, forming a well drained surface and preventing vegetation from taking hold.

Foundations should be of material other than timber, when possible, and should be durable, strong and solid. The top of each foundation should be level, and from front to rear the top surface of the parallel crossers should be in alignment, so that the lumber to be piled will bear equally upon each one. The foundation piers should be spaced not over 4 ft. apart, except for heavy stock, to prevent sag. The front piers of the foundation should be raised above the second, the second above the third, etc., to allow a slant in the stock of at least 1 or 1½ in. per ft.

Where the boards are of uneven lengths the overlapping ends sag. To avoid this condition, lumber of uniform lengths should be put on one pile, or else the longer lengths on the bottom and the shorter lengths above, to allow a bearing surface for the stickers, with no overlap. Boards in the several layers should be piled with a slight space between them for free air circulation. For the same reason, and also to facilitate fire fighting a space of at least 2 ft. should be allowed between stacks.

Stickers used in spacing the several layers of stock should be uniform in thickness, of course, and of proper thickness so that a standard sticker can be used throughout the yard, thereby eliminating hardships and mistakes on the part of the lumber handlers which would be caused by the use of several different sizes of stickers. They should be ¾ or 1 in. thick and a few inches longer than the width of the pile, preferably 6 ft. long. They should be placed one over the other in the pile, in order that a solid bearing surface is given, to prevent warping.

### Handling Lumber in Bulk

In the more modern yards, all the lumber is piled directly from the cars to the kiln trucks, and, as the whole yard is laid out on rails, whereby a flexible arrangement is secured, the piles on the cars are easily handled in bulk to the yard, back to the kilns, or directly to the kilns, and finally directly to the machines. All these operations are accomplished, not by the old method of piling and repiling each time, but simply by the transferring of the cars; consequently, the lumber is handled but twice: First, when it is piled on to the trucks from the car, and second, from the trucks to the machine on its way to a finished article.

In the larger yards, where thousands of feet are handled daily, power transfer cars are used rather than the ordinary push transfer car. This in itself cuts down the labor cost and increases the ease of handling, as well as shortening the time.

All grading should be done at the place of shipment when possible. This is a big paying factor in large operations, as it eliminates this slow operation at the plant in unloading cars, thereby reducing time and curbing the demurrage costs on freight cars. It also eliminates cull stock from shipment, which allows a greater useful shipping capacity and lowers freight charges.

The dry kilns should be the very best; that is, the selection of drying equipment should not be based upon initial costs, as the operating and time expense on drying will soon eat up the amount saved on the initial expenditure. Equipment that is the most flexible—one that can dry all grades, sizes and thicknesses—rather than one that is limited as to what it can do—should be procured.

The fundamental conditions for drying, requisite heat, proper humidity, and circulation must be obtained.

Any reliable automatic equipment for control of heat or humidity is a big asset to any dry kiln, in that the extra cost will soon be taken up by the improved quality of stock obtained, the decrease in time required for drying, and the avoidance of all worry on the part of the operator. There are many such contrivances on the market to-day, but the majority are too complicated and in many cases are purchased from outside agencies which are not dependable.

Controls should be conveniently located and equipment supplied for making the humidity readings without the operator entering the kilns. There is equipment of this kind to be had that is mounted in the face of the kiln wall. A person who has ever entered a kiln at a temperature of 160 deg. Fahr. will readily appreciate that the operator is not going to make any more humidity tests in the kiln than necessary. You simply pay the bill in unknown losses. Instruments, such as recording thermometers, hygrometers and testing machines, constitute a great asset in the furtherance of proper handling of lumber through the kiln.

### Dry Storage

Wood readily absorbs as well as gives up moisture, depending upon surrounding air conditions. If wood is dried down to 5 per cent moisture content and put into a shed in which the relative humidity of the air is not controlled, it will soon pick up additional moisture, the amount being dependent upon the exact climatic conditions. So much additional moisture may be accumulated in the stock that trouble will occur during the manufacturing process, or later, in the finished article.

A dry storage should be used in connection with the dry kilns, so that any surplus stock, or stock that has been kiln dried, may be held at the proper moisture per cent by controlling the relative humidity of the air in the building or room. Just a few heating coils, and ventilators in the roof of this building, are ample for this control.

The lumber on each car should be tested for moisture content when put into the dry storage, and a notation should be made on both the car record and on a tag that is tacked on the stock. Before the stock is used, another test should be made for moisture content, previous to the stock's being removed from storage. If the moisture content has accidentally risen, it is much easier and quicker to dry this off than it is to cull out many pieces during the process of manufacturing, due to checking and the like.

Body stock that is stored in a shed can be kept at 8 per cent moisture content indefinitely, if the temperature is held at 70 deg. Fahr. and the relative humidity at about 42 per cent.

Low humidities in factory buildings are often lost by the fact that windows and doors are opened, which soon allows the air condition to become the same as that of the outside atmosphere. Then again, humidities in various parts of units of the factory should be about uniform, as it is evident that the differential in humidity to which stock is subjected in passing from one unit of low humidity to another of higher humidity, or vice versa, will cause the stock to work. Inserting pet cocks on the steam heating coils, or putting in steam jets throughout the factory, will give a simple means of raising or lowering humidity.

Keep records of your operations, both for the purpose of bettering these records and for reference on future work. Standardize your operations. Standards are here, as everywhere, fundamental to progress and efficiency. You must have standards for supply and use of time, materials and equipment before you can determine what conditions are best. You must make use of records in order to determine the relative efficiencies of different trial conditions under investigation.

# Grinding in the Automotive Industry

## Part III—Grinding Engine Parts

In this instalment the application of grinding to specific parts of the vehicle is discussed. Tolerances before and after grinding are given together with particulars as to type of machine and grade of wheel.

By P. M. Heldt

**P**ERHAPS the best way of dealing with the application of grinding in the automotive industry is to take up in succession the more important parts of the vehicle in the manufacture of which grinding is used and briefly describe the processes employed.

In the engine there is hardly a part that does not have grinding work done upon it. The most important grinding operation in engine manufacture is the grinding of the cylinder bore. The power and efficiency of the engine depend to a large extent upon the accuracy and smoothness of the bore. The latter must be as nearly as possible a true cylinder; it must be perpendicular to the base and it must be smooth. It is impossible to obtain as smooth and accurate a surface by machining as by grinding. Cast iron is not of absolutely uniform hardness, and whatever hard spots there may be in the cylinder wall will spring away from the boring tool, causing a high spot, especially if the wall is comparatively thin, as it usually is in automobile engines.

The first machine to be used for cylinder grinding so far as recorded was a Brown & Sharpe grinder, but in 1905 the Heald Machine Co. began to specialize in the manufacture of cylinder grinders, and this concern has supplied most of the grinders of this type in service in the automotive industry to-day. It is interesting in this connection to note that the first order for a cylinder grinder was placed with the Heald company by Elwood Haynes, the well known pioneer of the automobile industry. The extent to which grinding is being used to-day for finishing the bores of internal combustion engines may be judged from the statement of one manufacturer of internal grinders that 84 per cent of all makers of passenger cars use engines with ground cylinders, and 91 per cent of all makers of motor trucks. Grinding is also used for refinishing the bores of cylinders after they have become scored or worn out of round.

### Cylinder Grinding Data

In one well-known engine plant from 0.008 to 0.012 in. stock is allowed in the cylinders for grinding, and tolerances of plus and minus 0.001 in. are called for on the finished bore. Twelve cylinder blocks having four  $4\frac{1}{2} \times 6$  in. cylinders each are finished per 8-hour day in one of the cylinder grinding machines.

In another plant individually cast cylinders of a large tractor engine are ground. The limits on the turned bore are 6.483

and 6.488 in. and the bore has a length of  $11\frac{13}{16}$  in. In the rough grinding operation 0.017 in. of stock is taken out, that is to say, the bore is enlarged by this amount, while the finish grinding operation enlarges the bore another 0.001 in., making the final limits 6.5025 and 6.5045 in. As in practically all cylinder grinding, silicon carbide wheels are used, of 36 grain and soft grade.

Cylinder grinding is done dry, because water played on the work would form with the metal dust ground off a mud which would choke the wheel. A certain amount of heat is generated in the course of the operation, depending on the hardness of the metal, the hardness of the wheel and the rate at which the work is pushed. To keep the working surfaces at a uniform temperature, cold water is usually run through the jackets of the cylinder block. The dust formed by the grinding operation is carried away dry by means of an exhaust fan. It has been suggested in the past to run hot water through the jacket so as to maintain the cylinder block at substantially working temperature while grinding it, and this plan has been followed to some extent. To-day most manufacturers are using cold water in the jackets, however. The reason is that cylinder bores must be inspected for accuracy after completion, and this inspection usually takes place an hour or more after the grinding operation has been completed, when the block has returned to normal temperature. The cylinders will distort somewhat during the process of cooling, and if they were exactly true after the grinding oper-

Cylinder grinding on a Heald grinder

Landis cylinder grinder

Heald piston ring grinder

ation they are sometimes slightly out after they had cooled, with the result that blocks which were ground with the highest accuracy by this method may be rejected by the inspectors.

#### Grinding Valve Sleeves

Cylinder grinders are also used for grinding the internal surfaces of the valve sleeves of Knight engines. In the case of the Stearns-Knight the sleeves are held in a cylindrical fixture which is cast with a double wall to form a water jacket, and water is circulated through this jacket to keep the sleeve at a uniform temperature. These particular sleeves are finished to an outside diameter of 4.6923 in. and an inside diameter of 4.250 in., and they are 13.125 in. long. The tolerance on the bore is 0.0005 in. and the production is about 50 per 10-hour day.

As an instance of the illogical practices of some firms in the use of grinding equipment, one manufacturer of internal grinding machines relates the following: One of the best automobile factories in the country obtains cylinder castings from two different foundries; unfortunately the castings from the two sources are not kept separate in going through the factory, and therefore every cylinder grinding machine has to handle castings from both sources in the same lot. It so happens that the iron of one foundry is very soft and easy to cut, its scleroscope hardness ranging between 18 and 20, whereas the iron from the other foundry is very hard, showing a scleroscope hardness of 38 to 40, and it is very difficult to find a wheel which will produce a smooth surface on it. Yet these people expect satisfactory work with these very unlike castings on the same grinding machine and with the same wheel. If they would only cast small distinguishing marks on the castings made in the two foundries it would be an easy matter to keep them apart, and by working on one lot on one day and the other on the next they could use a different grade of wheel for each and thus achieve much better results.

#### Characteristics of Cylinder Grinder

Cylinder grinding machines differ materially from plain internal grinders for the reason that most parts that re-

quire internal grinding are of plain cylindrical or other simple shape and can readily be held in a chuck and revolved, so that the axis of the wheel may remain stationary, but a cylinder block is so heavy and of such irregular shape that it cannot well be swung in the machine. The operation therefore called for a machine in which the wheel spindle, in addition to its axial rotation, has an eccentric motion to bring the wheel in contact with the entire circumference of the bore. The cylinder block is bolted and doweled to a fixture secured to the carriage of the grinder and one bore is ground at a time.

#### Piston Ring Grinder

Another special kind of grinder used in the automotive industry is the piston ring grinder, and this was introduced even previous to the cylinder grinder. Piston rings must be accurately finished on both sides and on the circumferences. The latter surface can easily be finished in an ordinary cylindrical grinder after the ring has been clamped on a mandrel. When the rings are turned off in the lathe a rough edge is almost sure to be formed, which prevents a gas-tight joint with the side of the ring groove. Moreover, when cutting off the rings from a pot with multiple tools, the different rings do not come of exactly equal thickness. It appears that all piston rings manufactured to-day are finished to thickness by means of grinding.

A machine for finishing the sides of piston rings by grinding was brought out in 1903 by the Heald Machine Co. A magnetic chuck was used for holding the rings, on a vertical axis, the rings being simply placed on the chuck. The grinding wheel, which was carried in a sliding head moving horizontally, would travel from the outside to the center of the chuck and back again. The same machine could be used for grinding disks, thrust collars and similar parts.

The plan of holding the rings in a magnetic chuck proved entirely practical, ensuring rapid operation and high accuracy. Almost any mechanical way of holding the rings would have caused distortion. It is claimed that rings can be manufactured in quantity in this way with a

Diagrams illustrating principle of magnetic chuck

limit of accuracy of 0.0005 in. as regards the measurements of different rings and in a single ring the tolerance around the circumference is held to 0.00025 in.

Piston ring grinding is a special form of surface grinding. In order to save time the work is not fed in a straight line toward the wheel, but is rotated around its axis. There are two general types of piston ring grinder; in one the grinding wheel grinds with its cylindrical surface and its horizontal spindle is mounted on an automatically reversing wheel slide; in the other the wheel is of the ring type and operates with one of its end faces. According to the diameter of the work, the wheel is set by a lateral movement of the wheel slide.

### Grinding Pistons and Piston Pins

Pistons are ground on their outside surface which bears on the cylinder wall, in order that that surface may be true and smooth. This work is done in cylindrical grinding machines. In one particular plant the pistons, which are 4½ in. in diameter, come to the grinding department rough-turned 0.030 in. oversize and are finished in a single operation with tolerances of plus and minus 0.0005 in. Aluminous wheels of 24 grain and medium grade are used. The output is 300 per eight-hour day. For holding the pistons in the grinder one end is centered, while a cap, placed over the open end, is held in position by a dummy piston pin which passes through the piston bosses and the shank of the cap. In another plant producing a high grade car the pistons have a number of grinding operations performed upon them. In the final cylindrical grinding operation from 0.004 to 0.007 in. is taken off the diameter, the skirt being brought down to a diameter of 3.375 in. with tolerances of plus zero and minus 0.001 in. In this case silicon carbide wheels are used, of 36 grain and soft grade. The time is two minutes per piston.

Piston pins are ordinarily of case hardened material and the common method of finishing them is by grinding. They can be ground either on a mandrel between centers or in a wedge type of steady shoe, the first method being preferable as far as results are concerned.

At first sight it might be thought that there would not be much chance for grinding operations on the connecting rods, but such is not the case. Grinding starts with snagging of the rough forgings and ends with the finishing of the outside surface of the piston pin bearing bushings which are of phosphor bronze. The end faces of the two ends of the rod can be faced off to advantage in a face grinding machine with magnetic chuck. A considerable number of rods can be placed in the machine at once and the chuck fed under the ring type of grinding wheel at a speed of about 25 ft. per min. All the advantages of surface grinding with magnetic chuck are here attained, including accuracy and rapid production. The plane surfaces of the joint between the cap and

the rod may also be ground if a high grade product is aimed at, and after the cap has been bolted in place the big end is bored out by means of a special fixture. These operations on the connecting rods are generally performed with vitrified aluminous wheels of 36 to 46 grain and soft grade. Grinding of the piston pin bushing is practiced by the Buda Co. The bushings are first bored, reamed and faced at one end in a screw machine and are then placed on an arbor and put in a grinder in which from ⅛ to 3/16 in. is removed from the diameter, the bushings being finished to tolerances of plus and minus 0.0005 in. Formerly the bushings were first turned in the screw machine to within 0.015 to 0.020 in. of the finished size, but now they are ground to the correct size directly from the rough. The production in the grinder is 600 per eight-hour day and it may be readily imagined that a good deal of work is saved by eliminating the turning operation on outside diameter.

STATE control of gasoline in France came to an end in August when the last of the army reserve stocks of gasoline were sold. From now on the importation of gasoline is free, with the exception that a certain percentage of the fuel imported must be kept in reserve for military use when required. The retail selling price of gasoline has been maintained at an artificial level by the law obliging importers to purchase government stocks of fuel to the extent of 50 per cent of their imports, these stocks being paid for at excessively high prices.

Outside Paris the minimum retail selling price of high-grade gas is now 9 frs. 40 per can of 5 litres, being equivalent, at current exchange, to 56 cents per American gallon. A further reduction is expected before the end of the year, but the determining factors now are exchange rates and freights. The American system of bulk storage and curb side pump distributing stations is making great headway in France, and particularly in the neighborhood of Paris. Dealers who stock gasoline in cans are obliged to cut their profit to almost vanishing point in order to compete with the pumps. The French motoring public appears to appreciate the time saved and the economy gained by use of pump-filling stations compared with the can system.

Grinding cylindrical surface of piston and piston pin (Landis)

# A New Principle Used in Machine for Producing Spur Gears

Multiple cutters are employed to form several teeth simultaneously. Operation is similar to that of a vertical shaper except that the tools are held stationary and the gear blank is reciprocated.

**A** DISTINCT innovation in gear production methods is employed in a newly developed machine for the production of spur gears in quantity. In the usual type of gear planing machine one tooth is cut in the blank at a time, a single cutter being used. This principle is departed from in a new type of gear cutter which has been developed by the Stevenson Gear Co., in which all of the teeth or a simple fraction thereof are cut at the same time. Evidently, if the number of teeth in the gear to be cut is a prime number, the same number of cutters as teeth must be used; if it is an even number, half the number of cutters can be used, and if it is divisible by three, one-third the number of cutters as teeth will do. The essential member of the machine is a special tool head which consists primarily of a series of radially disposed tools spaced about the circumference of the blank to be cut.

This machine operates in the same manner as an ordinary vertical shaper, except that the tools are held stationary and the gear blank is reciprocated past the tools. The mechanism of the machine consists essentially of a ram carrying a blank supporting arbor and the multiple tooled head for operating upon the blank. The frame of the machine is a casting of rectangular box section with a vertical cylindrical portion at one

end. The ram is mounted in the center of the cylindrical part of the frame and the tool head is mounted above the ram at the top of this portion. The crank shaft which drives the ram is journaled near the top of the rectangular section; it is provided with an adjustable crank head at the end next to the ram and is driven through back gears by an electric motor. The arbor which carries the gear blanks is not made solid with the ram but fits in a socket in a spindle which is journaled inside the ram and is free to rotate independently of the reciprocating motion imparted to it by the ram. An intermittent indexing movement is imparted to the spindle after each cutting stroke by an intermittent gear train. The machine is 7 ft. high, weighs 17,000 lbs. and when operating to full capacity is driven by a 100 hp. motor. Its capacity is for gears 12 in. in diameter, 6-in. face and 4 diametral pitch.

The tool head consists essentially of a flat steel disc 3 ft. in diameter, provided with a hole at the center and a number of radial grooves cut in its face in which the tool bits are arranged like the spokes of a wheel about the circumference of the gear. Successive feeding movements are imparted to the tools by an annular sectional cam ring. As the gear blank is reciprocated past the cutting tools, the tools are gradually fed in by successive cuts to the full depth of the tooth. At the completion of each stroke of the ram and before the next cut begins, the gear blank is indexed a space equal to one tooth, thereby presenting a different tool to each tooth from the one which made the previous cut. After the tools have been fed in to full depth, they are held stationary in that position while the cutting process continues until the gear has indexed one complete revolution, thereby giving each tool an opportunity to take one last cut on each tooth. This final complete index insures a uniformity of spacing of the teeth in the gear equal to that of the indexing mechanism. Uniformity of the tooth form is secured even though the tools themselves may be far from uniform for it is at once apparent that if any tool is longer or wider than any other tool, even though it be only a thousandth of an inch, that portion of it which is longer or wider will take one last cut on the corresponding portion of each tooth in the gear, thereby eliminating any variation which may have been caused by previous cuts. It is claimed that by this process of finishing all the teeth of a gear with a single

Fig. 1—Stevenson multiple cutter gear shaper

Fig. 2—Tool head for Stevenson gear shaper

Fig. 3—Bottom view of tool head

Fig. 4—Tool head, showing tools and feed cams

finishing tool, this machine attains great accuracy, and the speed is multiplied by the number of tools operating on the gear blank at one time.

Fig. 2 at the top of this page shows a top view of the tool head as it appears when in operation on the machine. Fig. 3 is a bottom view as it appears when taken off of the machine ready for disassembly or adjustment. In Fig. 4, the tool head is partly disassembled to show the principal details of the mechanism. When it is mounted on the machine, as in Fig. 2, the only working parts to be seen are the points of the tool bits surrounding the gear blanks and the small depth adjustment dial seen in the upper part of the illustration. The four pairs of T slots seen in this illustration are for attaching a piloting device which is used on extremely long and slender arbors which may need an outer support. Two tool heads are provided for each machine and while one is in use on the machine, the tools of the other are being sharpened and re-set ready for use after the tools in operation begin to dull. The tool head is held in place by 8 studs and nuts. When it is desired to set up a new job or to sharpen the tools, these nuts are taken off and the head is lifted off the machine and replaced by the other head. This arrangement permits the machine to operate practically continually with little loss of time on account of set-up and sharpening tools. As the tool head is taken off the machine, it is turned bottom side up on trunnions as shown in Fig. 3. The clamp gear and plate are then removed, exposing the tools and feeding mechanism as in Fig. 4.

The tool bits shown in Figs. 4 and 5 are rectangular in section, except the lower side, which is in the form of a "V." The gear tooth profile is formed at the inner end of this tool and is backed off to permit sharpening without changing the form. The outer end of this tool rests against a spiral cam surface and is ground in the form of an exact radius. A small pin near the back end fits in a groove which has an opposing spiral surface and retains the tool in close contact with the other cam surface to insure correct contact, as well as to withdraw the tools to their starting position after the cut is finished.

The individual cam lugs are mounted on a large ring which encircles the tool bits and spacing plate and are held down by T bolts which fit in a circular T slot in the ring. The tool bits are adjusted for depth independently by moving these cam lugs individually along the T slot relative to the cam ring and each other. Simultaneous feeding movements are imparted to the cam ring through the 2 idler gears seen in the lower part of Fig. 4 and are produced by a feed mechanism

which will be explained.

The final depth to which the tools are fed is determined by an adjustable stop which limits the rotary feeding movement of the cam ring. This feed mechanism being spring actuated, the position of the depth controlling stop can be varied within reasonable limits without resetting of the feed mechanism. This is particularly desirable during the operation of the machine in cases where the tool bits may not have been set to exactly the right depth in the beginning or in cases where the keen edge wears off the tools and they begin to cut gears that are uneven or oversize long before they are actually dull. The dial which controls this adjustment is seen in the upper part of Fig. 2 and can be reset quickly when desired.

In order to provide relief for the tools on the back stroke of the ram, a reverse feeding movement is imparted to the cam ring and before the beginning of the cutting stroke; the forward feeding movement of the cam is made great enough to compensate for the slight retraction for relief and also to provide the necessary additional feed for the depth of the next cut.

The large gear and plate shown in Fig. 3 are used to intermittently clamp and release the tool bits during the cutting and feeding operation. The lower central plate is mounted directly above the tool bits and is provided with adjustable set screws and lock nuts above each tool. The outer gear member is free to rotate about the central plate and is provided with screw threads which engage a corresponding threaded portion of the tool head base. A rotary reciprocating motion imparted to this gear by a cam operated segment clamps the tools during the cutting operation and releases them

Fig. 5—Tool bits used with Stevenson gear shaper

Fig. 6—Feed and clamping mechanism

during their relief and feeding movements. This clamping arrangement by forcing the "V"-shaped seat on the tool bit into a corresponding "V"-shaped seat on the spacing plate in the tool head serves to centralize and accurately locate the cutting point of the tool and in addition to take up clearance and looseness, so as to eliminate vibration and chatter.

The feed and clamping mechanism shown in Fig. 6 comprises the segments and cams for actuating the tool head feed cam and the tool clamping gear. The feed cam segment, which is shown near the center of this illustration, swings about the central stud as a fulcrum and is moved directly by a spiral cam. This cam is rotated intermittently by a ratchet on which it is mounted and can be adjusted to produce various feeding motions. It can be seen from the illustration that this cam has a

long gradual slope for the feeding movement and a sharp descent for quickly returning the tools to their starting position at the completion of the cutting operation. The slight retraction for producing the relief movement is accomplished by mounting the fulcrum stud eccentrically on a shaft, which is given a partial rotation by a face cam on the large driving gear. The tool clamping gear segment seen in the lower part of the illustration is actuated directly by a push rod in contact with another face cam on the large driving gear. The releasing movement is accomplished positively, but the clamping movement is effected by means of a spring, in order to eliminate the possibility of breaking some part if the clamping mechanism were accidentally adjusted too tight.

The indexing mechanism, as shown in Figs. 7 and 8, consists of a split bushing guide, one-half of which is attached to the ram spindle, the other half being attached to a revolving drum on which is mounted a worm gear driven by a worm and an intermittent gear train. The intermittent indexing movement is derived from a Geneva wheel and is transmitted through a set of change gears to the worm and worm wheel. By varying the ratio of the change gears in the train, indexing movements for any desired number of teeth may be obtained. Minute angular adjustments of the spindle position varying by one second of arc, for locating keyways, teeth of cluster gears, etc., are obtained by means of a differential clutch between the worm and worm shaft.

The main crank shaft is connected to the large back gear by a quick return crank of the drag link type, as seen in Fig. 1, which imparts a slow motion to the ram during the cutting stroke and a quickly accelerated motion for the return. The driving motor is mounted on a sliding base and drives through a single set of speed change back gears. The drive for the indexing mechanism is taken direct from these gears. The pump for circulating the cutting oil is driven from a small sprocket on the end of the motor shaft opposite the driving pinion. The motor is controlled by a push button switch, automatic compensation and solenoid electric brake.

# Educating the Truck Dealer to Sell Transportation

The dealer must be taught to sell transportation. He must learn how to make a detailed analysis of specific haulage problems; how to determine the truck units best fitted to perform efficiently in each case. Here is how one manufacturer is presenting transportation analysis to his dealers.

By Norman G. Shidle

THE future development of the motor truck industry depends largely upon the recognition by manufacturers of the broader aspects of merchandising problems. The truck is a unit of transportation and must be marketed as such. The truck manufacturer is selling transportation rather than motor vehicles. To properly sell transportation considerable data as regards operating conditions, operating costs, etc., must be developed. Principles underlying proper analysis in any given instance must be determined and tested. The task embodied in developing these features of transportation merchandising has scarcely been begun and the individual effort of all manufacturers will be necessary before sufficient data can be obtained to form the basis of any comprehensive study.

It is possible immediately, however, to discuss the factors entering into the analysis necessary in selling truck transportation equipment to the user. A few firms have recognized the importance of the problem confronting them, have developed certain principles and, in specific instances, have accumulated considerable performance data.

The manufacturer is likely to find that he will have to be the leading spirit in developing this idea of selling transportation, of outlining detailed methods of accomplishing it, and of instructing his dealers both in fundamentals and in details. For this reason the work of the Selden Truck Co. is of special interest at this time. This company has outlined for its dealers the various factors entering into a transportation analysis, has instructed its dealers in the use of the analysis and has shown the relation between the various factors involved. This analysis probably is not the last word on the subject, but it is far in advance of the methods common to truck selling to-day and constitutes an excellent example for study.

There are two main heads in the transportation analysis developed by this company. They are:

1. Basis of analysis; items to be known and considered.
2. Method of procedure.

The first division has to do with determining the conditions under which the truck will have to operate, the material it will haul, etc. The second division relates to the type of truck best adapted to the conditions outlined and the exact cost of operating that truck. The various divisions of the two main heads are worth discussing in detail.

The first division under the first head is the material to be hauled. Concerning this factor it is necessary to know the kind of material and the quantity in which it is to be hauled. It is also necessary to know the methods used in assembling the material for loading. It

often happens that inefficient methods of assembling the material increase trucking costs materially. This concern takes the attitude that the truck salesman should understand every factor affecting trucking cost, whether it relates directly to the running of the truck or not. Thus, if the salesman finds that the assembling of material is not being done in an efficient manner, he is expected to point out to his prospective buyer how those conditions can be improved.

Then road conditions must be studied. These will have a direct affect upon operating costs and consequently must be understood by the salesman before attempting to solve the particular transportation problem.

Next comes the problem of loading conditions. Loading devices may be applicable which would reduce appreciably the loading time and cost. The load must be assembled in the best possible manner taking into account loading and unloading time as well as safety of the load during driving time.

Routing conditions must be analyzed. The number and place of stops, the unloading conditions and the laws restricting unloading conditions all come in for consideration. The distance of the trip to be made constitutes another factor, while garage conditions are also important. The distance of the garage from the starting and stopping point of the regular runs is an important factor in operating costs, while the equipment of the garage will have an effect upon the way in which the truck will be serviced. All of these items, then, are to be known and considered before attempting to tell the man what truck equipment he should buy. Presented in outline form they appear as follows:

1. Items to be known and considered.
  - A. Material to be hauled.
    - a. Kind and quantity.
    - b. Assembly of material.
      1. Plant conditions.
      2. Can they be improved?
  - B. Road conditions.
  - C. Loading conditions.
    - a. Loading devices.
    - b. Load assembly.
      1. Plant arrangements.
      2. Devices for efficiency.
  - D. Routing conditions.
    - a. Routing of stops.
    - b. Unloading conditions.
    - c. Laws restricting unloading.
  - E. Trip distance.
  - F. Garage conditions.
    - a. Distance from loading point.
    - b. Conveniences for working.

This brings the analysis to its second stage, termed in the Selden outline, "Method of procedure." Under this head there are two main factors, namely, operations and

cost. Seven points are to be considered under "operations."

First the salesman—or transportation engineer, as he should be in fact, if not in name—must determine from the facts already considered the proper size of truck and type of body best adapted to economical operation under the given conditions. It will immediately be objected that this is easier said than done in many cases. That is true, but the salesmen of this truck are being materially assisted by a weekly data service which present them with actual figures and experiences of trucks already in use. This service is discussed more fully later in the article.

The next factors are the standing time and the running time. In connection with the former, loading and unloading time must be found, while the type of load and road conditions will be determining factors in the latter case. Then the total time for the various trips must be determined. From this can be computed the number of possible trips during each day. In making this computation delays should always be allowed for and the traffic conditions of the trip may have to be analyzed to determine what that allowance should be. The allowance for delays is analogous to the allowance made in time study work. The scientific analysis determines the theoretical possibilities of perfect performance and then allowance is made in the light of practical difficulties and experience.

The amount of material that can be hauled is determined. This quantity is given in barrels, gallons, pounds, tons, board feet, or in whatever units are common to the industry of the prospective purchaser. This is a point not always recognized by truck salesmen.

The purchaser is interested in how much of the material he deals in can be carried, and he is used to gaging amounts of that material in certain units. To tell a lumber man that the truck will haul six tons a day does not give him any mental picture of what is to be accomplished. The Selden company tells more than one story of sales gained or lost through failure to recognize this comparatively small factor of sales psychology.

Then the actual work done by the truck is determined. This work is usually expressed in unit miles, i.e. that number of units multiplied by the number of miles those units are carried. The actual computation is not made on this theoretical basis, however, since it has been found that practical contingencies render it improper for actual use. The rule used is as follows: "To determine a unit mile when loads are carried one way only multiply total loads carried by one-half the round trip distance. . . . To determine a unit mile when loads are carried both ways multiply total loads carried by actual round trip distance." The latter case, of course, is in accordance with the theoretical rule.

Special care is always taken to explain fully what a unit-mile is, since many purchasers are not familiar with the term and its usage. Often, in fact, it is advisable not to insist too strongly on this terminology where the prospective purchaser is unfamiliar with it. This completes the first section of this second main division. In tabular form its looks like this:

## II. Method of Procedure.

### A. Operations.

1. Determine from previous facts proper size of truck and type of body most economical.
2. Standing time; loading and unloading.
3. Running time; depending upon load and road.
4. Total trip-time.
5. Trips possible each day.
6. Amount of material hauled.
7. Number of unit-miles; work actually done.

After this careful analysis has been accomplished it is possible to figure the probable costs of operation. These must in turn be analyzed and subdivided so that the prospective purchaser may know accurately what to expect in the way of truck transportation costs. The first factor under cost is that of investment. This item includes cost of chassis, body, cab, freight charges, war tax, etc. It will be noted that the truck man has already done a great deal of constructive analysis work for the benefit of the prospective purchaser before the matter of original investment is discussed. This is proper not only from the standpoint of sales psychology, but also from the standpoint of good transportation. The initial investment—or any other costs for that matter—can be properly visualized only in their relation to other factors of transportation.

Next to the original investment come the fixed charges, the charges that must be expected continuously. These charges include interest on the original investment, insurance, garage, taxes and license. They are computed on a per year and per day basis. The transportation engineer in any territory must be thoroughly familiar with the insurance, garage and tax rates in that territory, as well as with the details of all the laws regarding trucks. Liability, fire and theft, collision and property damage insurance are included in the cost analysis, although the items are separated so that the prospective purchaser may eliminate any that he feels are unnecessary in his particular case.

Then there are the variable charges. These are computed on a per mile basis and include fuel, oil, tires, maintenance, depreciation. Here again the data service comes to the aid of the salesman in aiding him to determine accurately the variable charges in a particular case.

Drivers' wages are included as a separate item. Then the total cost of operation is computed and included as the final item under "cost." There are several steps in

Analysis of Selden Truck Operation and Costs	
Owner—Luger Furniture Co. Address—North St. Paul, Minn.	Business—Furniture Manufacturing Truck Capacity—2½ Ton ("A" Model)

38. Total for Period 8 mos..... 105.30	
Note Carefully	
This 2½ Ton Selden has operated with another Selden to connect two factories which are 28 miles apart. With railroad switches at the doors the factories suffered heavily because of four day trip necessary for shipping. The trucks have reduced this to a 9 hours trip, travelling an average of 50 miles per day at the cost of \$16.70. A remarkable low rate to pay for the services obtained. The total repairs for the 75 days was \$45.00 although an estimate of 2 cents per mile or \$100.00 was set.	

determining this total operation cost. First, the total variable charges are multiplied by the total miles traveled. To this are added the total fixed charges and the total drivers' wages. The result obtained is the total cost per day. From this the total cost per mile and per unit-mile can readily be computed. For greater clearness the various factors under the second division of "Method of procedure" may be tabulated as follows:

**B. Cost.**

- a. Investment.
- b. Fixed charges; per day and per year.
  1. Interest on investment.
  2. Insurance.
  3. Garage.
  4. Taxes and license.
  5. Total per year; per day.
- c. Variable charges; per mile.
  1. Fuel.
  2. Oil.
  3. Tires.
  4. Maintenance.
  5. Depreciation.
  6. Total per mile.
- d. Driver's wages.

In working out these costs, depreciation is figured according to the following rule: "To find depreciation per mile subtract cost of tire from total investment and divide this result by estimated life of truck in miles." Obviously there is room for variation in nearly every factor mentioned throughout the entire analysis. The aim, however, is to render the figures as nearly truthful as possible, for the cause of transportation—in which every truck manufacturer has a vital interest—is greatly injured every time inaccurate figures are given; figures which promise more than subsequent operation proves practically possible.

The advisability of trailers is also a factor to be considered. When they are necessary the type must be determined and 15 to 30 per cent added to operating costs.

Such an analysis as the foregoing, however, provides a sound basis upon which to base an accurate estimate of future performance, and indicates, as well, the factors to be considered in calculating past performances on the basis of actual records. There is great need in the industry for more data concerning truck operating costs under various given conditions. Such data can be compiled only by careful investigation over a long period of time and by many manufacturers. Some such system of transportation analysis, if taken up by a large number of truck manufacturers would accomplish several things, each important to progress:

1. It will build a permanent business for the manufacturer; it will enable him to sell more of his own trucks.
2. It will bring the motor truck more favorable notice as a real economic factor in transportation.
3. It will develop the use of trucks in a sound and economic manner.
4. It will make for the permanent progress of the truck industry as a whole.

The weekly data service used by this company has been mentioned. This service is of interest because of its function in connection with the foregoing transportation analysis and also because of its part in building up data on truck operating costs. Its points of contact with the transportation analysis have already been indicated, but the system itself has not been described.

**Weekly Data Service**

From all parts of the country the Selden company collects information concerning the performance of its trucks in various industries. The company asks men

who have been operating the trucks to write a few brief paragraphs concerning the conditions under which the truck has been performing, the type of loads it has been carrying, the routes it has been making and various other details of its performance.

In addition to this, it procures from the man operating the truck operation and cost records. This analysis sheet has two purposes. First, to provide a suitable form upon which the operation and cost data of Selden trucks can be tabulated as received from owners, presented to prospective purchasers that they might profit by the experience of the owners.

Second, to provide a suitable form upon which to list the various items of operation and expense which would be incurred by the prospective purchaser, if a Selden was put to work.

This material is all practical and accurate information. It should not be confused with the ordinary house organ "performance stories" which are so common. These are detailed studies of trucks being operated in various industries, of trucks performing regular routine hauling jobs.

Each week all dealer salesmen receive one of these data sheets; each week their files of data grow and on the basis of the figures and performances recorded elsewhere they are aided in making new analyses.

This does not mean that the figures of one performance can be used to predict costs in another case. Thorough analysis of each individual case is essential, but the general aid rendered by such a service can be easily understood. A sample of one of the analysis sheets which comprises part of one week's data service is shown in the accompanying cut. The value of data of this kind grows as more of it is accumulated and the value to the industry will grow as more companies begin to gather it.

## Number of Automobiles Licensed in Great Britain

**P**ARTICULARS issued by the Ministry of Transport indicate approximately the number of automobiles in use in Great Britain on May 31. The figures given apply to the number of vehicles for which licenses have been taken out and are issued primarily in connection with a return showing the yield of the new motor tax from Jan. 1 until May 31. This tax, which is applied in one form or another to private passenger cars, trucks, motorcycles and hackney carriages (otherwise public passenger vehicles) yielded £8,436,000 (about \$42,000,000). The number of vehicles licensed during the period mentioned as compared with the year ended March 31, 1920, was as follows:

	1921.	1920.
Private Passenger Cars	212,000	185,700
Motorcycles	370,000	278,600
Public Passenger Vehicles	95,300	71,400
Trucks	16,000	No Record
Agricultural Tractors	10,160	No Record

In arriving at the 1921 figures allowance has been made for the fact that in the case of private cars and public passenger vehicles quarterly licenses were taken out in some cases.

As giving some indication of the average horsepower of private passenger cars in use, the average yield of tax per license is of interest, for the tax in this class is at the rate of £1 per horsepower. The average yield per license was £17 6s, which indicates that the average horsepower is 17.3 by the rating adopted, namely .4D<sup>3</sup>N where D equals the diameter of the cylinders in inches and N the number of cylinders.

# The FORUM

## Variations in Tread

Editor, AUTOMOTIVE INDUSTRIES:

Referring to Mr. David Fergusson's letter in the Aug. 4 issue of the AUTOMOTIVE INDUSTRIES, there is little doubt that the 56 in. tread for automobiles was taken from the 56 in. standard wagon tread of the North, and his own statement that for fifteen years he has used this tread seems to establish this, and it is difficult to see how the standard was derived from the railroad tread.

As a matter of fact, the railroad tread was derived from the standard 56 in. carriage tread which was in use many years, both in this country and England, before the railroad was even dreamed of.

The suggestion that the 56 in. tread should be adhered to because trolleys have this tread is also equally bad, for if this tread is adopted and the automobile run on the trolley rails it is absolutely the worst tread that could be adopted, as the tires are apt to get badly worn and cut, as pointed out by Mr. Fergusson, as both wheels tend to run in the groove of the rail instead of on the flat surface. If slightly wider at least one wheel will run on smooth surface.

If any one will take the trouble to measure the width of the trolley rails to the center of the flat surface this will be found to be about 58½ in., and if the automobile was made with this tread both wheels would run on smooth and flat surfaces, except when crossing switches, and the tires would be preserved instead of being worn, and for this reason the writer in 1904 made 58½ in. as his standard tread (long before any automobile standards were adopted), for in those days, before there were any hard roads outside of the cities, running on trolley rails was oftentimes not only desirable but necessary for miles at a time.

The fallacy of a 56 in. standard is shown by Mr. Fergusson's own statement, that so prominent a company so easily departs from it, and if this is to be done it is just as easy to vary half a foot as half an inch.

Neither is it a fact that the dirt and clay roads have distinct ruts (except in the engineer's mind) until they are created or produced by the engineer's creation of a standard tread, as pointed out in my previous letter, and for this reason, if none other, should be abandoned. If it were possible the groove of the trolley rail would be made as large as the deepest rut of a dirt road.

Further, it is not a fact "that on hard roads almost every part of the road is traveled and there is no necessity for varying the tread" and many improved state roads have signs, "Do not travel in the same rut." As previously pointed out, until we had the cement or concrete road we have never been able to make an "improved" road that would not go in ruts where standard treads were used.

The advantage of varying the tread does not apply so much to hard roads as Mr. Fergusson seems to think in his reference to paragraph 21 as it does to soft roads as pointed out in paragraph 22.

Neither was it suggested to make cars (automobiles) 65 in. or 70 in., but from 48 in. to 63 in., as stated in paragraph 20. The wider tracks referred to trucks and

they exist to-day on the 3, 5 and 7 ton trucks and even if they are not 70 in. to the center of the wheel, on solid tires, they are more than this to the outside of the flat portion.

As Mr. Fergusson points out, "Unfortunately many of the latest improved highways are almost too narrow for cars of 56 in. tread," but this doesn't take the 65 in. to 70 in. tread trucks off the road, neither will it keep them out of the garage.

Admittedly the car would be much improved in appearance and have a better balanced appearance by being considerably narrowed in body width and vice versa—so long as the wider exists the same would apply to a wider tread; one is as logical as the other, and perhaps as easy to bring about, and it is up to some automobile maker to have the courage of his convictions and boldly adopt say a 60 in. tread or a 10 in. narrower body.

Either would have the same advantages as regards the problems of body construction, disappearing windows, appearance, riding qualities, mud guards independent of the body, etc.

In regard to external and internal brakes it is, I believe, a fact that not one European car or American truck is fitted with external brakes, and even the Pierce-Arrow trucks, which are of later design than the car, have this distinction. If internal brakes become inoperative from oil this could probably be overcome by an improved method of preventing the oil from escaping from the axle and certainly want of contact of surface is due to bad design. The difference in surface between an external and internal brake applied to the same diameter of drum only 3/16 in. thick is not so much. External brakes drag 75 per cent of the time more or less and, as pointed out, the soft braking material quickly cuts out. W. J. P. MOORE.

## More Accessible Emergency Brakes

Editor, AUTOMOTIVE INDUSTRIES:

I have been reading with much interest the recent discussions on four wheel brakes, as set forth in the Forum, and I should like to add another feature pertaining to braking and brakes. The great majority of car builders seem to be constantly overlooking the emergency brake.

It is almost a physical impossibility for the average driver to reach the emergency brake handle, since it is usually hidden under the dash, when occupied with one foot on the clutch and the other foot on the service brake, looking forward trying to avert an accident. It is in time of danger that such an important thing as an emergency brake should be within easy reach.

Less than half a dozen manufacturers have arrived at any definite improvement over the old style hand brake, which is usually difficult to reach in case of an emergency.

Generally speaking, the service brake bears the brunt of the braking effort applied to the rear wheels, and it is true (as Mr. Moore says) that about 75 per cent of these brakes are either dragging or are loose; what then about the emergency brake?

The active part of the emergency brake now seems to have degenerated into a wheel-lock used to keep the car

from moving while parked on an incline, but most drivers shift into reverse to utilize the braking power or inertia of a dead motor.

I have done some remodeling of brake handles on several makes of cars and I find that by cutting off the shank immediately above the pivot pin hole and welding in enough material to lengthen the handle to any desired height it may then, by bending it to conform to the dash, be placed within easy reach of the driver. The release rod and catch are operated the same as before with an extension welded into the rod. The action of the handle is improved by the additional leverage and so adds both a mental and physical security to the driver. It is surprising to note the psychological effect obtained by this simple remodeling, as shown by count of the number of times this remodeled brake handle is brought into use compared with its more obsolete form. This naturally results in a decrease in the constant wear on the service brake band.

I should like to hear from some of the manufacturers as to why some such changes are not made in the prevailing emergency brake handles; is it the cost of the change or pure negligence and indifference?

R. W. ORRELL.

## Some Features of Body Design

Editor, AUTOMOTIVE INDUSTRIES:

The letter of Mr. W. J. P. Moore in the *Forum* of July 28, mentions the capacity of the rear seat. Speaking from the body builders' point of view, we know that the rear seat cannot be made to accommodate three adults comfortably, with 56-in. tread, but we do know that the public, including the majority of special body buyers, insisted on the maximum seating width at the rear. With the increase in the number of bodies that eliminate the folding seats, the necessity of the additional seat room is greater than ever.

The writer received an inquiry from the Pacific coast last week asking if we could build a coupé body with room for three on a straight seat across. Think of what that means. The driver sitting back of the wheel occupies one-half the body width and by some magical means, the body builder is expected to arrange for seating two persons comfortably on the remaining half of the body.

Mr. Moore mentions 20 in. as the space for each person, but 17 in. is the maximum allowed by body builders, and public conveyances sometimes allow only 16 in. The maximum width on an open body rear seat is 51 in., and as the shoulders of those seated at the sides can extend beyond this, a fairly comfortable seat for three can be arranged. On a closed body the maximum seat width is 48 in. To seat three, a pillow may be used in the center that will put the shoulders of the middle passenger forward of those at the sides. This will be a very acceptable seating arrangement for most people.

The stock body furnished by the car manufacturer may at times be carried over to suit material on hand and manufacturing conditions, but as a rule manufacturers, except those who build the very cheap car, change the body models each season to incorporate the needs that their experience with the trade during the preceding year has taught them. The writers' experience as stated above, is that even the special-order bodies must seat three at the rear.

In paragraph 11 Mr. Moore suggests that all seats except the driver's seat be made movable and capable of being adjusted to suit different occupants. This has been tried in various ways and one manufacturer featured such an arrangement at the New York show a few years ago. The majority of car users do not take kindly

to anything that is adjustable. They don't want to even fold down the touring body top. All folding-top body designs except the cabriolet have been eliminated, and the cabriolet is used in limited numbers. Removable sides can be used to convert the California top into a closed body, but this design, which has excellent and substantial features, has not taken hold to the extent that was anticipated, due simply to the inherent dislike of the public to be troubled with mechanical devices that mean work, at a time when they look forward to doing nothing but drive or ride in the car. They will change a tire because there is no other way out, but the writer's experience has proven it better to leave all convertible and mechanically operated arrangements out of the body that you can possibly do without.

In paragraphs 12 and 13 Mr. Moore speaks of the seats and trimming. The idea of air cushions being a substitute for those now used may have commercial advantages. The increased tendency to roll would prevent the use of a single air bag, but the possibility of air cushions would be feasible if the cost can be made low enough.

As to paragraphs 15 and 16 the writer agrees with Mr. Moore that some plan of mounting the body and carrying it suspended, so that the distortions of the frame are not communicated to the body as shocks would be an advantage. The writer outlined a suggestion on this line in the June 16th issue of the AUTOMOTIVE INDUSTRIES. The advantage of some form of construction there outlined would be to eliminate the squeaks of the body and frame contact and permit the body to ride more evenly and without distortion from the frame.

GEORGE J. MERCER.

## Engine Cooling

Editor, AUTOMOTIVE INDUSTRIES:

Mr. Ludlow Clayden's remarks on "Improved Engine Cooling" in the July 28 issue are of interest. I am in the main in agreement with his comments in the engineering number regarding the relative positions of air and water cooling.

To state, however, that the present position of the air-cooled engine is analagous to that of the two-cycle engine is a deal more amusing than accurate. The success of the Franklin car I think demonstrates that air-cooling is by no means as undeveloped as suggested.

Mr. Clayden apparently entirely ignores the progress that has taken place in Europe with the large air-cooled aircraft engine cylinder, although it is admitted that the reports seem exaggerated to those who have not witnessed the results. However, it is but a matter of a short time before it will be demonstrated with cylinders of domestic origin that such reports are not flights of fancy and that claims to equality of brake mean effective pressure and of exhaust valve reliability, with the best water-cooled engines have some foundation in fact.

Mr. Clayden rightly says that the air-cooled engine is not waiting for any great invention to aid in its development. Its development in Europe has been the result of common sense and extensive careful research, the cylinders having been to all practical purposes designed on the test engine.

The lessons learned from the high-efficiency water-cooled engine are in the main applicable to the air-cooled engine if due allowance be made for the variation in the specific heat of the cooling medium.

S. D. HERON.

# An English View of American Industrial Relationships

Two keen British observers visited America recently, and, after returning to England, made some interesting comments regarding American industry. A few comments by Mr. Tipper serve as a background for their remarks. The labor problem is prominently discussed.

By Harry Tipper

**I**T is interesting at all times to see ourselves as we appear to other people, and particularly when the conclusions of the visitors are complimentary to us. Mr. E. J. P. Benn and Mr. F. Elliott recently reported to the Industrial League and Council of Great Britain their impressions of the United States, particularly in regard to the industrial development, after a visit to this country.

Their impressions were recorded in the *Daily Telegraph*, and there are many suggestions in the statements they made.

Viewed in this way, it is obvious that the conditions in the United States are so much better than conditions in the most stable European countries, that the troublesome difficulties are really very small in comparison.

Some comment should be made upon the statement as to the differences in the attitude of labor in this country and in Great Britain.

The long history of union development, the homogeneous character of the people, and their tendency to remain in one place have accentuated the political tendencies toward socialism by the very increase of uniformity in the course of these developments.

We are fortunate in this country to have a different standpoint, but the development of trade union, uniformity of pay, and uniformity of operation lead inevitably toward uniformity of production pace in the last analysis.

The great difference in the ownership of houses by the workers in the two countries is perhaps the most important difference in influence. The vast majority of workers in Great Britain do not own their houses and the possibility of ownership is hampered by the old land laws which still exist. The workers, therefore, have no stake in the stability of the country. The ownership of real estate demands a stability and safety not otherwise visible in their necessity to the worker.

Where rent is paid weekly, and all the items are weekly, and there is no visible connection between the worker and the community, there is less hesitation about employing experimental ideas and there is a more general tendency to radical movements.

Mr. Benn and Mr. Elliott are able men, close and keen observers, and the following comments on our industrial conditions are repeated here as worthy of attention:

Mr. E. J. P. Benn said he was in America five weeks—just long enough to appreciate that fifty years would be insufficient to grasp all that America had to teach one.

But upon one point he could be definite without any qualification; the need for the closest understanding between the English-speaking peoples as

the means of saving the world for civilization was recognized by the Americans with a depth of conviction which rivalled, if it did not excel, our own.

He confessed that he had returned a more confirmed individualist than when he set out. Could they imagine a land of 110,000,000 civilized persons without a political labor party; a land in which the workers, who had never heard the words "ca' canny," regarded restriction of output as a mythical madness? The policy which was known here as "9d. for 4d." was there expressed as "nothing for nothing." The differences between ourselves and our American friends in these industrial questions were so fundamental that little use could come from the discussion of matters of detail.

That veteran leader of American labor, Mr. Sam Gompers, claimed that so far from being fifty years behind England in matters of labor organization, America was 100 years ahead. He claimed that to estimate the success of a labor movement one must not judge by the violence of its political programme; a more effective test was to go to the homes of the people. Mr. Gompers pointed with pride to the 6,000,000 working-class homes which were either completely or partially owned by their workmen occupants; to the 12,000,000 automobiles among 110,000,000 people; and to the 15,000,000 owners of shares or other forms of property which existed in that wonderful country.

America, like the rest of the world, was having her revolution, but there it was taking the form of a transference of large blocks of industrial capital into the hands of the workers in industry. The most striking example was the Ford Works, where the workmen owned no less than \$6,600,000 worth of the company's stock. The force of this movement was further shown by the fact that savings banks at street corners were more numerous in America than public houses at street corners here. Mr. Gompers claimed that he was leading the only constructive labor movement in the world.

The whole force of public opinion in America, said Mr. Benn, was directed to teaching its people how to push, while here it seemed to be concerned to teach its people how to lean.

Having expressed the view that the vast accumulation of wealth in the U. S. A. would not flow to Europe as it should do until Americans regarded Europe as a safe place for the investment of money, he said that an American Senator told him that America looked with some apprehension on the light-hearted way in which we appeared to be conducting great and novel economic experiments, particularly in the matter of legislative enactments. This

Senator gave the following list of British inconsistencies:

- (1) Our demand for German indemnities and our refusal to take German goods;
- (2) Our need for industrial activity and our taxation, which, to an American, spelt nothing but industrial murder;
- (3) Our depleted wealth and our bragging of a higher standard of living;
- (4) Our centuries of economic experience, and our flippant economic legislation, which appeared to be enacted and repealed with equal regularity and levity;
- (5) Our surrender to lassitude, the natural result of the war, and our self-infliction of doles and dope which must inevitably accentuate the trouble.

In Chicago, proceeded Mr. Benn, he heard a speaker tell a brotherhood meeting of 2500 men that "no power in Heaven or in hell can prevent America from assuming the leadership of mankind." "I am here to say that is true," said Mr. Benn, "if we are going on in the way we have followed during the past couple of years. But if we can succeed in taking advantage of the one thing we have which America has not—the one thing which has given us the trade unions and other blessings; if we take advantage of our genius for organization and turn it to constructive instead of destructive purposes, then America can do all the leading of mankind she likes; she will have to come here to learn how to do it."

American wages were roughly two and a half times those earned in this country, but it was erroneous to suppose that American labor costs were dear. American labor, as a cost factor in production, was among the cheapest in the world. He watched a man earning 7s. 6d. per hour tending three machines, which in this country would each have required a minder and a laborer to care for.

If it were true that we had to face the consequences of cheap German labor we had also to face the good, healthy, straightforward competition of efficient, hard-working, economic American labor.

The theory that America was the land of the "Almighty Dollar" was true, but all depended upon what one meant by the dollar. The impression of Americans as a grasping, materialistic crowd of moneymakers was altogether beside the mark. We understood neither America nor the dollar. While we groveled in the depths of sophistry, getting more and more miserable as we failed to find the philosopher's stone in the shape of some mystic new system, the streets of America were thronged with happy, optimistic people who talked a great deal about dollars but more about service. Most mysterious of all, one found the two words used in association.

The American, being a sound economist, recognized that the proper measure of service was not that put upon it by the man who rendered it, but the measure calculated by the one who received it. The only measure which the receiver of service could use was the dollar, which explained America's attachment to it.

The underlying inspiration, the thing which gave the cheery life which characterized that wonderful people, was not the dollar, but service. The Declaration of Independence gave to the American citizen the right to life, liberty, and the pursuit of happiness; he found happiness, satisfaction, self-respect, and independence in doing good and useful work; in rendering service.

Mr. F. Elliott, who also replied, said the deepest impression that he formed of America was that it was a nation of capitalists. The country's wealth was rapidly passing from the hands of the big people into the hands of the many, and that transference

was being welcomed by the big leaders of industry, who saw in it a bulwark for civic stability and industrial stability.

When referring to the packing houses in Chicago, he said that Swifts had 40,000 shareholders, which included 14,000 employees. The shareholding averaged thirty-seven shares per individual, and it would require 900 shareholders to pool 51 per cent of stock and exercise control. In some firms bonds were purchased on the instalment plan, a system that would be good in this country.

The standard of living and dress was higher among the workers in America. In Detroit there was one motor-car to ten inhabitants. Here it was one to ninety-five inhabitants. Few signs of poverty were to be seen. Prohibition seemed to have been a good thing; it was certainly better to have the savings bank at the corner of the street instead of the public-house. He did not know whether it was due to prohibition, but America seemed to have passed through her industrial crisis with comparatively little trouble in the way of resentment, or poverty, or strikes. They had accepted wage "cuts" in a philosophical fashion. While he was there the steel-workers' wages were cut by 20 per cent. They studied and understood economics in America.

Rather than see the works of the American Manganese Company—which supported thousands of people—closed, the workpeople and directors met, and there was a voluntary offer to accept a cut of 40 per cent in wages. The directors agreed to that, and in return they agreed to reduce the rents of the houses in which the workers lived by 40 per cent.

Then the shopkeepers agreed to reduce the prices of necessities, a most practical effort at co-operation in bringing down prices. They had no old age pensions and unemployment schemes. The Secretary of State for Labor told him and his colleague that they thought the people of England were being pauperized by their methods of social reform.

The American worker said, "Give me the highest possible wages, and in return I will give you the highest possible output and look after my own old age pension."

The American was no more enamored of the bureaucrat than we were in England. He had a slogan, which Mr. Hoover invented, "Less Government in business and more business in Government."

ENGLISH aircraft papers report that owing to the steadily increasing use of the air mails the German postal authorities have found it necessary to establish a main aerial post office in the Konigstrasse, Berlin, in order to be able to properly handle the mass of aerial mail which leaves Berlin daily in connection with the regular air services.

The German Government now grants a subsidy of ten marks per kilometer to exclusively German companies for flights less than 250 kilometers and eleven marks per kilometer for flights exceeding 250 kilometers.

The official stipulations, however, require each subsidized company to declare its daily services in advance and to undertake the carrying of mails and passengers. Connections at specially indicated railway stations in order to link up with the railway expresses are also insisted upon, and every effort has to be made to link up with the international air services flying through Germany and making use of German aerodromes.

In regard to the occupied zone, motor bicycles carry the mails and passengers from the nearest points at which German aircraft are permitted to land by the Inter-Allied Air Commission.

## Truck Overloads Prohibited

THE tendency of users to overload trucks has been one difficulty met in truck merchandising. Truck transportation units often have failed to perform effectively in a given case because of continual overloading. Such failures, although not justly attributable to the truck manufacturer, have reacted against him because the user failed to understand the real cause of the poor truck performance.

Certain provisions of the Connecticut motor vehicle law are interesting in this regard. A complete file is being made in Connecticut of every commercial motor vehicle, its model number, type and carrying capacity. Motor vehicles are taxed according to total piston displacement and according to carrying capacity. To carry out this provision, Section 32 of the law prohibits the operation of an overloaded motor vehicle. A commercial motor vehicle, therefore, cannot be operated in Connecticut beyond the carrying capacity or rating of the manufacturer.

If such a vehicle is found on the road overloaded, the operator is arrested and prosecuted under this sec-

tion of the law. The state officials do not allow a two-ton motor truck to be rated as a three-ton truck simply because of the addition of a few spring leaves. To facilitate the operation of law, Section 42 requires that the maximum capacity, light weight and maximum speed in miles per hour be painted on the side of each truck.

This is one case, at least, where the state law would appear to operate to the advantage of the truck manufacturer in compelling the sensible loading and use of a truck of a given capacity.

## Variation of Power with Compression Ratio

THAT the mean effective pressure and the maximum output of an engine increase with the volumetric compression ratio used is well known, and in practically all engines the compression ratio is made as high as the character of the fuel to be used and the conditions of operation in the service for which the engine is intended permit. There is a theoretical formula for the variation of the mean effective pressure with the compression ratio, namely,

$$\text{m.e.p.} \left( \frac{1}{r} \right) y - 1$$

in which  $r$  is the compression ratio and  $y$  the ratio of specific heats, which latter for air has the value 1.41.

There is comparatively little experimental data available to substantiate this formula, because it is seldom that two engines are built exactly alike except for the compression ratio. It would be absolutely futile to try to substantiate or refute it by means of data from engines varying also in other respects, as the mean effective pressure is influenced by many other factors. Some years ago, however, the Benz company of Germany made tests on an aircraft engine with successively increased compression ratio, starting with a ratio of 5 and ending with 5.8, and the results obtained in these tests afford a means of checking the formula. In order to prevent preignition and knocking at such high compression as that corresponding to the ratio 5.8, benzol was used as fuel. The tests were even extended to cover the case of a compression ratio of 6, but it was then found impossible to prevent preignition, and the power fell off for all speeds.

For an increase in compression ratio from 5 to 5.8 the above formula indicates an increase in mean effective pressure of 6.3 per cent. In reality the increase was 16 per cent at 1600 r.p.m., 14.5 per cent at 1500 r.p.m., 12.5 per cent at 1400 r.p.m. and 10.9 per cent at 1300 r.p.m. That the increase should be greater than the theoretical is easily explained, because theory takes account only of the increase in pressure or directly due to the higher compression and neglects the gain due to the reduced cooling area. It is also clearly shown that the gain in power due to the increase in compression ratio is greatest at the higher speeds. For all speeds, however, the peak of the m.e.p. curve seems to lie very close to a compression ratio of 5.8 (for this particular case). The rate of

increase in m.e.p. with increase in compression ratio increases at first, then decreases and for a compression ratio of 5.8 becomes zero, while beyond this point the m.e.p. decreases. For gasoline the optimum compression would, of course, be lower. But the conclusion seems justified that for each design of engine operating on a particular fuel there is a compression ratio which gives the highest m.e.p. at all speeds, and that for lesser compression ratios the m.e.p. and the power output drop more rapidly than the theoretical formula would indicate.

## A Fool's Paradise

**F**EW men are better informed regarding the automotive fuel situation than H. Foster Bain, Director of the Bureau of Mines. In complimenting us for articles on the fuel situation which recently appeared in these columns, Mr. Bain says:

"I agree with you that it is not desirable to emphasize the impending scarcity to a point where people get nervous. We will find some way to supply what it is necessary to have when the time comes. It is well, though, that the industry should appreciate the difficulties that will have to be faced and not rest in a belief that the future will be as easy as the past."

Is the industry going to heed the advice of those who have made a thorough study of the fuel situation and take steps to economize in the use of remaining petroleum resources by building apparatus better suited for their efficient utilization, or will it prefer to live in a fool's paradise until the pinch comes and business suffers correspondingly?

Some far-sighted companies are looking ahead and planning their research work accordingly. Others continue to turn out apparatus, which is not only wasteful of fuel but gives trouble because no serious attempt is made even to vaporize present-day fuel, which is temporarily better than it was a year ago and far more volatile than it will be in the not distant future. This seems incredible if they realize that there is such a thing as a fuel problem.

## Shows and Congresses

**A** METHOD which is being successfully used in France for stimulating interest in new industrial developments might be profitably adopted in this country. Over there industrial shows are combined with so-called "congresses" at which are presented papers on the technical and economic problems to which the new development has given rise. Two such international congresses were held in Paris during the early years of the automobile industry, and no doubt helped materially in securing for France that pre-eminent position in the manufacture of automobiles which she enjoyed for a long time. Such international congresses are particularly opportune in the early stages of an industry when the movement in any particular country is not sufficiently advanced to be self-sufficient and when the people engaged in it are still eagerly looking across national boundaries for ideas and suggestions. But the plan can also be carried out on a national basis, as was shown on the

occasion of the Columbus tractor show last winter. At the meetings in Columbus it was quite obvious that the persons attending the conferences were very eager to learn, and had it not been for the poor acoustics of the hall in which the meetings were held the attendance would have been very good.

The average show visitor of the "ultimate consumer" type has only a very limited knowledge of the principles underlying the construction and operation of the apparatus shown, and while there is much information freely dispensed at the stands, it is not always of the character most desired by the visitor and, moreover, it is biased.

The French plan of international industrial congresses is, of course, materially different from the American plan of free lectures at industrial shows. The "congress" is partly independent of the show and its expenses are defrayed from dues paid by the members. Each member has the right to present to the Congress a communication on any of the topics covered by the program of the affair, and each receives in due course a copy of the printed "transactions." The aeronautical industry has reached the state where an international congress would meet with considerable support, and it is not surprising to learn that a congress will be held in Paris in October.

## Market Research Methods

**T**HERE are a number of very real dangers to be avoided in carrying out a program of merchandising research. Considerable emphasis is being laid upon such efforts in all parts of the industry and constructive progress is being made, but one point must be constantly born in mind. The object of merchandising research is to discover as accurately as possible the market for a given make of car or product and the best methods of selling that market. This object must not be confused with the mere obtaining of a formula or an answer that sounds plausible but does not bear close examination.

Final conclusions must not be based on insufficient evidence. Merchandising data are almost entirely lacking in the automotive industry at present, so that it will be necessary for some time to make temporary plans and adopt temporary policies on the basis of inconclusive data, as additional information is obtained. There is an immediate and practical value to be obtained from each bit of new marketing data that is gathered and compiled, but it will be necessary for a long while yet to carefully interpret the data so obtained in the light of the many variables and unknowns which still enter into the calculations.

Certain engineering and production problems have been puzzling engineers for years. Experiments and investigations are still going on in regard to these problems. Real merchandising research is comparatively a new development in the automotive field. Involving, as it does, the complex problems of human psychology along with other intangible and variable factors, final results cannot be expected in a brief time. Definite value can be derived from each step of progress when results are carefully interpreted and the relative value of the various factors understood.

## Firestone Reaches Peak of 1920 Output

Average Production Over 28,500  
Tires Daily With 50%  
Less Workers

AKRON, Aug. 22.—That which it has been freely predicted would never happen—namely, any of the major tire building companies of America returning to their 1920 records of peak production this year, has been accomplished by the Firestone Tire & Rubber Co. of Akron.

While other major companies in Akron are laying off men and curtailing tire production, Firestone has been adding men and steadily increasing production and this week had climbed back to an average production of over 28,500 tires daily which compares with the company's 1920 peak established a year ago last April, of 28,800 tires a day. The present Firestone record is 28,500 casings and 30,000 tubes daily.

### Others Laying Off

In the face of the Firestone report of steadily increasing orders, both from dealers and manufacturers, Akron's other two leading tire companies are reducing production. Goodyear in the past three days has laid off 900 men and curtailed production commensurately and Goodrich has dropped from 16,000 tires daily to 13,000.

The significance of the Firestone status is the fact that Firestone has wrested the tire production leadership from Goodyear and Goodrich, although in the past it has ranked third in the line of major rubber companies, and has now assumed the world leadership in respect to gross production of automobile and motor truck tires.

### Only 50 Per Cent of Workers

Another significant point is the fact that Firestone has returned to its peak production with slightly more than 50 per cent of its peak number of employees, and despite the fact that its factories are now operating on a basis of fewer hours of factory work a week. When Firestone reached the mark of 28,800 tires in April, 1920, it was running every department 24 hours a day and six days a week.

To-day Firestone is making the same production with a little more than half as many employees, and is running most of its departments only 18 hours a day on a six-day weekly basis. Most departments are operating two nine-hour shifts, and only a few are running three eight-hour shifts daily.

Goodyear up until the layoff of 900 men was turning out 25,000 tires a day. Steadily increasing individual factory efficiency, officials state, will mean only a slight modification of production, despite the heavy layoff of men.

The Miller Rubber Co. is operating on a basis of 4000 tires daily, as compared with a peak of 5200. The General Tire

& Rubber Co. of Akron is operating up to capacity and almost to peak production, making 1500 tires daily. Other smaller concerns are faring better than the larger tire building companies and are operating on a higher percentage of peak than Goodyear and Goodrich. The Goodyear peak was 31,181 tires and the Goodrich peak slightly exceeded 28,000 tires daily.

While other companies anticipate a slowing up of tire orders from now until next January, Firestone officials say they expect the present rate of business to continue, and are contemplating no production curtailment for several weeks at least.

## Illinois Sales Will Exceed 1920 Totals

BLOOMINGTON, ILL., Aug. 22.—Central Illinois automobile dealers report the volume of business this summer well ahead of the same period a year ago. Industries which were suspended last summer and fall are reopened in most instances and, while many are working with a reduced force as compared to the war period, there is a gradual increase in forces which is reducing the number of men out of employment and increasing the money in circulation.

With bumper crops farmers are becoming more cheerful. Wheat has been up to expectations and the major portion has been converted into cash. The money in most instances has been utilized in paying old obligations and in buying machinery and other necessities deferred from a year ago. The oats returns have been disappointing.

The corn crop promises to be the best in years. With the harvesting of the latter cereal the farmers will again be in a position to spend money and the men who handle tractors are preparing to interest them in a machine. Tractor demonstrations are being arranged in many sections in Illinois, which is a healthy indication of a revival in power farming business.

## Chicago Rural Sales on the Upward Trend

CHICAGO, Aug. 19.—Sales for August in Chicago and controlled territory are not as brisk as they were through July. There has been a decided falling off both in actual sales and inquiries. July business was unusually good, so that with the noticeable drop in sales business may still be said to be satisfactory. August this year compares favorably with the same month of last year.

The one bright spot as pointed out by Chicago distributors is the strong upward trend of rural business. Country dealers are finding more business than for many months, and the prospects are for fall business that will be very satisfactory.

Trucks are not moving, excepting for a light turnover of light machines. Tires are keeping up an active market and accessories are speeding up.

## Manufacturers Say Business Is Better

Indianapolis Reports Reductions  
Have Had Good Effect on  
Sales Everywhere

INDIANAPOLIS, IND., Aug. 20.—Reports from the various automobile manufacturers here show that business in the cars made in Indianapolis remains about the same throughout the country. It is significant to note that the reports show no particular territory far behind, with the exception of some sections of the south. Reports of sales made by dealers show that the eastern business is picking up slightly and the Pacific Coast sales appear to be a little stronger. No change has been noted in production schedules at the different plants. The H. C. S. Motor Car Co. now is working under its schedule of five cars a day. While some of the manufacturers here reduced prices with "mental reservations" it having been their private opinion at the time reductions were made that the result would be only a temporary increase in sales, they now have had time to see the result and they do not hesitate to say that the general reduction has stimulated business.

The sales forces here have been extremely active during the past week in an effort to cause August sales to equal the July sales. Present indications tend to point to an equal month with last month. The higher priced cars have had a good demand during the past week, which has heartened up the dealers considerably. Dealers in the Dodge, Chevrolet and Ford are confident there will be no slump during the month. This is considered remarkable in view of the fact that this is the big vacation month and hundreds of persons are out of the city. Accessory dealers also are having a good business, but it is not thought that this branch of the trade will equal the sales made in July. Tire dealers report a good business for August, but the volume will likely not be so large as in July, due to the cooler weather, they say, which has reduced tire wear.

### PLAN TOLL HIGHWAY

CHICAGO, Aug. 24.—Alfred E. Case, head of the brokerage firm of Case, Boyd & Co. of this city, is having plans drawn for a private toll highway between Chicago and Milwaukee, the road to be 200 feet wide and to be laid in six one-way traffic sections. The base of the roadway is to be of concrete with asphalt surface, if built as planned. Branch roads leading to the lake regions of Wisconsin are to be part of the system. Two of the six sections planned are to be for motor bus express; two to be operated as toll lines for private passenger cars and two as freight roads. A \$5,000,000 company has been organized with an authorized bond issue of \$10,000,000.

## Cleveland Demand Far Above Average

**Retail Dealers Believe August  
Business Will Surpass  
Same Period 1920**

CLEVELAND, Aug. 22—Statements of retail automobile dealers here that after harvest sales this year are exceeding those of a year ago for the month of August is borne out by conditions in industries that sell to the automobile trade.

August according to local leading retailers is running far better than August, 1920. Now that the harvest is about ended the farmers are commencing to receive money for their crops; sales of automobiles are increasing in the rural sections around Cleveland. The demand in this city is far above the average for August in the past.

### Steel Buying Better

Buying in the steel trade in the Cleveland district is better during August than it has been for many months. A large part of the buying is being done by manufacturers of automobiles, and this is taken as evidence that production will increase greatly in the fall. The buying movement in the steel industry reflects the low ebb that manufacturers have let supplies reach and also that it is generally understood that prices have reached rock bottom. Some of the newcomers into the automobile sheet field have made concessions of several dollars a ton to get trial orders.

The Wills Sainte Claire agency here, a newcomer to automobile row, reports that August business is running close to July figures, and that was a banner month. Floormen state that persons visiting the salesroom daily run from 60 to 100. There is a healthy interest in this car and the management reports that sales exceed expectations.

The cut in the price of the Hudson has greatly stimulated sales at the Stuyvesant agency—distributors of the Hudson and Essex. The price cut from present indications will send the record for August way above the average for the month and also will enable the company to do some nice business September, October and November.

### Dodge Going Good

The Dodge car is still selling at the same clip that made July this year one of the largest months in the history of the local agency, which is now the Barnes Motor Co. This firm will sell around 250 cars in this city during August from present indication.

The Chevrolet agency, which started a whirlwind business with the last cut in prices, has not experienced a let down in August. Other agencies also report a healthy demand.

Additional evidence that business is healthy in this city came when directors of the White Co. declared the regularly

quarterly dividend of \$1 a share payable Sept. 30, to stock of record of Sept. 15. Sales of trucks, especially in July, have been of a satisfactory nature and because of the generally improved conditions, the directors felt justified in declaring the regular dividend. It became known here that the White Co. had reduced bank loans \$2,500,000 since March 31.

The Ohio Committee on Public Utility Information reports that a survey of power users discloses a good increase recently in production. Electric power consumption in Cleveland the last week in July was 14.1 per cent higher than during the first week of the same month, the totals being 8,773,926 kilowatt hours the first week and 10,013,931 for the last. Gains also were reported for Akron, Lorain, Warren, Dayton, Columbus and Cincinnati. Automobile plants are among large users of electricity.

## Plants in Milwaukee Maintain Production

MILWAUKEE, WIS., Aug. 22—From the manufacturers' standpoint the automotive industries in the first half of August maintained, generally speaking, the production rate reached at the close of July. A few manufacturers of parts and equipment were successful in placing business on the books sufficient to warrant increase in working forces, but others made no headway or were obliged to make small cuts owing to extension of old orders due to somewhat lesser output by passenger car builders.

The situation is considered satisfactory, in view of the slight slackening of activity in some other centers. Locally there is no expectation of increased activity until the State fair season in the Middle West is in full swing and distributors and dealers begin to book new business on dealer contracts for 1921-1922 or retail orders. Farm demand, at present very slack, is counted upon to produce a revival as the harvest season comes to a close and stimulus is lent by agricultural expositions, State and county.

### DURANT BUILDS SALESROOM

DETROIT, Aug. 22—Ground has been broken at Lansing for the Durant Motor Co.'s garage, office and salesroom for the display of the new Durant car. The cost will approximate \$30,000 and the building will be the property of the Durant Motor Sales Co., a corporation distinct from the manufacturing organization.

### BRIGGS OUTPUT BRISK

DETROIT, Aug. 23—Business at the Briggs Mfg. Co., manufacturer of enclosed bodies, is running fully up to the height of business a year ago and practically at capacity. The office force at the factory has been doubled and almost as many men are at work in the factory as there were in 1920.

## Good Crops Swell Southwest Sales

**Many Dealers Report Business  
Back to Normal—Trucks  
Doing Better**

DALLAS, TEX., Aug. 22—The automotive business in North Texas, Oklahoma, parts of Louisiana, New Mexico and Arizona, supplied by Dallas dealers and jobbers continued to show some improvement during the first half of August. Many of the retailers in Dallas and other parts of the trade territory reported their business back to normal.

The selling of cars has been augmented by the presence of some \$100,000,000 from the grain and fruit crops. This money is now in general circulation and the buying has been rather brisk. Retailers have noticed also that buyers are paying cash, or considerably more cash for cars than they have been for many months.

Accessory men from all sections of the territory report brisk business and tire dealers claim their business was never better. One thing making the accessory and tire business so much better than it has been for months is the thousands of cars from other states which are now touring Texas.

Trailer and truck dealers have also found business increased and prospects generally brighter, especially in the grain and cattle belts.

The gathering and marketing of the cotton crop will begin before the first of September. For months the automotive business has been dull in the cotton belts of Texas because the farmers were without money. Retailers, accessory and tire men are ready to invade these cotton belts as soon as the crop begins to move.

## South American Trade, Better, Say Ford Agents

NEW YORK, Aug. 22—Distinct improvement in trade in some sections of South America is reported by Charles T. Lathers and George R. Brubaker, representatives of the Ford Motor Car Co., who have returned to this country on the Munson liner *Aeolus* from Buenos Aires after a study of business conditions. Their main purpose in making the trip was to effect changes in the management of the Buenos Aires branch of the company.

The Ford policy of cash against documents is working out very favorably, Lathers and Brubaker report. The branch has no bad debts, although there are about 300 machines in Pernambuco which have not been accepted.

Brazil is developing its highway systems, and the extension of improved roads is expected to have a substantial influence on the possibilities for American cars in that republic. Licenses, however, are too expensive.

## Automotive Bureau Planned for Mexico

### Expect Stabilization to Follow Move of American Commerce Chamber

MEXICO CITY, Aug. 10 (Special correspondence)—The American Chamber of Commerce has undertaken the organization of an automotive division and it is expected that the division will take up important work in an energetic effort to stabilize the business situation and to promote still further the demand for automobiles and automotive equipment in Mexico.

Improvement of existing roads, and the construction of new roads are going on rapidly. It is certain that the present activity toward good roads will result in continued efforts of the National Government, together with various State Governments, to improve materially the roads throughout the country.

Ford has opened a number of new agencies throughout this country. The third Ford agency in Mexico City has, in fact, just been given to A. F. Robertson, former manager of the Mayfield Auto Co. here. The new company is named the Robertson Motor Co. A. J. Sewall, a former Ford dealer under the Dallas, Tex., branch, has taken over the dealership at Guadalajara. The Dodson Manufacturing Co. is the new dealer at Torreon and Suess y Garcia Narro has opened a Ford agency at Zacatecas.

Effective Aug. 1, duty was placed on vehicles amounting to 75c. per kilo up to 250 kilos in weight, 60c. for the next 500 kilos and 50c. per kilo for weight in excess of 750 kilos. This does not apply to automobiles but it is rumored that the automobile industry may be affected by reinstatement of the old tariff on motor cars and it is possible that this may be put into effect as the present government needs additional revenue.

## Gilland Lock Builds Factory in Michigan

DETROIT, Aug. 23—Gilland Auto Lock Co. is building a factory at Fenton, Mich., which is expected soon to be in production of a patented lock for automobiles which operates by a system of buttons attached to the dash. The buttons provide for hundreds of combinations. The ignition system is automatically cut off when the engine stops and can be started only on pressure of the buttons forming the combination. Pressure of the wrong buttons sounds an alarm either by horn or gong.

### BOLLSTROM HAS RECEIVER

DETROIT, Aug. 22—S. O. Burgdorf has been appointed permanent receiver of Bollstrom Motors, Inc., St. Louis, Mich. The company's affairs will now be closed up.

### 5800 BUICK CARS SHIPPED DURING FIRST HALF OF AUGUST

DETROIT, Aug. 22—Shipments of Buick cars for the first half of August reached 5800, or approximately one-half of the 11,750 production schedule set for the month. With the fulfilling of this schedule the company will come within 250 cars of the biggest month it ever enjoyed. Present indications are that production will exceed this figure and probably set a new record. The shipments include all models, a large part being the new four-cylinder car.

## Malleable Iron to Open Plant in Indianapolis

INDIANAPOLIS, Aug. 23—The Malleable Iron Co., a new organization in a new plant in Kokomo, opens next week to supply the Haynes Automobile Co. and the Service Motor Co. of Wabash. The opening of this plant provides employment for 500 men. The Haynes company will average full normal production this month, although at times it has exceeded normal production. The Kokomo Rubber Works has been busy and other automotive plants in northern Indiana are getting back to nearly capacity operations.

In the southern part of the State motor car and motor vehicle body manufacturers report very satisfactory increases in business.

The Lafayette Motor Co. is making five cars a day. Stutz has resumed on a small scale and the Nordyke & Marmion Co. is operating to near capacity.

General conditions in the State have become encouraging, the building trades showing much activity. Crops have been fairly good but nothing unusual.

## Raleigh to Produce New Passenger Car

NEW YORK, Aug. 22—A new passenger car to be known as the Raleigh Standardized Six, which has been undergoing development for over two years, is shortly to be produced by the Raleigh Motors Corp. in Buffalo, N. Y.

The car is an assembled product using a six-cylinder 3¼ x 5 in. Herschell-Spillman engine, Borg & Beck clutch, Grant-Lees transmission with Kellogg tire pump, Merchant & Evans universals, Columbia axles, Sharon frame, Gemmer steering gear and American Body Co. aluminum body. Westinghouse starting and lighting equipment and Bosch magneto ignition are employed. Fuel is fed to the Stromberg LB-2 carbureter by Stewart vacuum system of the 2 qt. "industrial" type system from 17 gal. tank at rear of frame. The wheelbase is 122 in. Hotchkiss drive through 54½ x 2¼ in. semi-elliptic underslung springs is employed. Wheels are Harvey disk type.

## Export Situation Improved in July

### Figures Undoubtedly Increasing —Decline Shown Comparing With Same Period 1920

WASHINGTON, Aug. 22—A bright spot appeared in the automotive export situation during July. There has been a slight increase in the volume of passenger cars and motorcycles exported to this country. These figures are undoubtedly increasing at this time despite the fact that there has been marked declines in foreign sales of other automotive products. The records of the Bureau of Foreign and Domestic Commerce, for July, show that 2224 passenger cars were exported, representing an increase of 260 over the previous month. Shipments of motorcycles amounted to 441, or 103 more than in June. In every other item the decreases during the month were noticeable. The value of automotive parts, not including engines and tires, fell off \$259,003 since June, while shipments of trucks were 109 less than the previous month, and the total number of engines declined by 845, as compared with June.

Compared with July, 1920, the figures for the same month of this year show a tremendous decline in the volume of automotive exports, for instance, during July of 1920, 2042 trucks, valued at \$3,434,070 were exported, as against 399 commercial cars with a value of \$314,237, for the corresponding month of this year.

Passenger car exports for June, 1920, amounted to 13,320, valued at \$16,220,965, and for the same period this year, 2224 cars valued at \$1,873,368, or a decline of approximately \$14,500,000.

There is a slump amounting to \$75,816,548 in the total value of passenger car exports for the seven months ending July, as compared with last year. The decline in the volume of engine exports was very marked. These figures indicate that the foreign trade department of the Government and the industry have a difficult problem on their hands to develop foreign markets.

## Goodyear Officials on Inspection Tour

AKRON, Aug. 22—Officials of the Goodyear Tire & Rubber Co. have started on a month's inspection tour of the company's subsidiary corporations. In the party are E. G. Wilmer, successor to F. A. Seiberling as president of Goodyear; Vice-President and Factory Manager Paul Litchfield and General Sales Manager L. C. Rockhill.

The three have gone first to the Goodyear plants at Bowmanville and Toronto in Canada. From there they will proceed to California to inspect the Los Angeles tire plant and will then visit the Goodyear 56,000-acre cotton plantation near Phoenix, Ariz.

## Registrations for Bay State Increase

**Figures for Three Months Exceed  
1920 Period by Over 5000—  
Trucks Gaining**

BOSTON, Aug. 22—An analysis of the registration figures by the motor vehicle department for the year up to Aug. 1 shows a tendency toward buying for the last three months.

For May, June and July there were registered 55,081 cars. For the same period last year there were 50,842 registrations. And last year was regarded as an exceptional year until the slump came along in the fall.

For the entire period up to Aug. 1 there were registered a total of 266,342 cars while for the same period a year ago there were 220,799 giving an increase this year of 45,543. Of course a large number of these 1921 registrations were used cars.

### Figures for Months

In 1920 there were 33,417 registrations in April. May they dropped to 21,771. June they figured 15,128 and July 13,943. This year there were 37,447 in April. The drop in May was to 20,687, or 6760 against the last year drop of 11,646, a balance of 4886 in favor of 1921.

June of last year showed a decrease from May of 6643. In 1921 for the same months the decrease was but 1857, or another balance for this year, this time of nearly the same as the preceding month, or 4786. This July showed a larger falling off than a year ago, for the decrease in 1920 was 1185 while for 1921 it was 3266.

What is happening, apparently, is that buying is going along like a series of waves, up and down. About every dealer has a number of very live prospects, some with cars, others figuring on buying. These people are trying to solve the fall business, and while they hope it will pick up they are not certain therefore they intend to continue along until they see how things are going to shape up.

### Trucks Show Gain

This is reflected, too, in the registration of trucks. While the total for the year is larger by 5063 than a year ago, the monthly registration figures show that for the past four months the totals are smaller than for the same ones in 1920. But the declines average pretty nearly the same as for the last four months of 1920.

The fees show a large increase, however, and the State is \$773,827 richer this year than for the same seven months of 1920. This year the fees have climbed to \$4,115,688.50. With this average for a comparison when the fines are computed later Massachusetts will get from the motorists this year about \$5,000,000.

## ORIGINAL VANNIMAN ENGINE RESTS AT BOTTOM OF LAKE HURON

AKRON, Aug. 21—The original Vanniman engine, used to propel the huge Vanniman dirigible, the first large dirigible to be built in America, and which crashed near Atlantic City nine years ago, killing its pilot and crew, now rests somewhere on the bottom of Lake Huron.

The Vanniman airship was built by Goodyear. After the disaster at Atlantic City the huge engine was dug from the sands where it imbedded itself in its fall from the skies and was shipped to the Les Cheneaux Islands in Lake Huron, to the summer home of F. A. Seiberling, founder and former president of Goodyear. A high-powered motor boat was constructed for Penfield Seiberling, aged 22, son of F. A. Seiberling, the Vanniman engine being installed in it.

A few days ago, while speeding near the Les Cheneaux Islands, young Seiberling's boat struck a rock. Due to the heavy weight of the engine, the craft sank in less than a minute. Young Seiberling, after swimming around for nearly half an hour, was rescued by Stewart Rodgers of Cleveland.

## Pierce-Arrow to Have New Enclosed Models

BUFFALO, N. Y., Aug. 22—The Pierce-Arrow Motor Car Co. has introduced four new enclosed drive bodies for the Standard Pierce-Arrow Dual Valve Chassis. These are in addition to the standard open and closed types of cars already listed. The new ones include a coupé; four-passenger, four-door sedan; seven-passenger sedan, and a seven-passenger vestibule sedan.

Several new constructional features are used in these models, among which are a new form of roof construction which does not differ any in appearance from the previous roof construction, but eliminates drumming. The roof, instead of being a sound board to intensify noises, deadens all sounds. Special attention has been given to ventilation and the duplex windows in the rear quarters lower close to the sill, the door windows open fully, and the windshield is adjustable. A cowl ventilator forces air along the floor boards, while a new roof ventilator, cleverly concealed by the dome light, draws air from the interior.

### PASS AUSTRALIAN TARIFF

LONDON, Aug. 16 (By Mail)—The revised Australian tariff has been passed in the face of strong opposition by the agricultural interests and the rest of the Empire against a reduction from 12 per cent to 5 per cent in the preferential rate accorded British goods.

## Cleveland Tractor Puts Out New Model

**Lightweight Cletrac Is Radically  
Different—Will Sell for \$845  
Complete**

CLEVELAND, Aug. 20—A new, lightweight Cletrac has been added to the line of the Cleveland Tractor Co. The new tractor, which is known as model F, is also a tank type, but of radically different construction throughout as compared with the larger Cletrac.

Weighing but 1820 lb., and with an overall width of but 32 in., this new tractor lends itself readily to such work as corn cultivation, being able to operate between corn rows without difficulty. In order to facilitate this function, a cultivator which is particularly adapted to the machine has also been brought out by the Cleveland Tractor Co. The new tractor sells for \$845 complete f.o.b. Cleveland, and the cultivator \$135. This is a two-row cultivator and with the new lightweight tractor puts in the hands of the dealer a complete unit which is priced at less than \$1,000 f.o.b. the factory.

The new tractor is constructed of chrome steel wherever severe stresses are encountered. It is noteworthy for the exceptionally ingenious use that is made of pressed steel in its construction. The track chain operates upon a floating roller chain in place of wheels and differs in this respect materially from the other Cletracs. The makers claim a plowing rate of 6 to 8 acres a day using two 12-in. plows. It is stated to develop 16 hp. at the belt and 9 hp. at the drawbar. The overall dimensions are 80 in. in length, 50 in. in height and 32 in. in width. The four-cylinder engine has a bore of 3¼ in. and a stroke of 4½ in. It is rated at 16 hp. with kerosene at the normal speed of 1330 r.p.m. There is one speed forward and one reverse. A feature of the design is that the entire tractor is self lubricating from the supply of oil in the motor and gearcase unit, which is all contained in one housing. The tracks are designed to run without lubrication so that a minimum amount of upkeep attention is required.

### BELGIAN TRADE GOOD

LONDON, Aug. 12—(By Mail)—The automotive industry in Belgium has had a rapid recovery. The possibilities of export trade have been taken up seriously and have led to the design of light but strong cars of from 12 to 14 horsepower for export. The centers of business are Liège and Brussels. Belgian roads are notoriously bad and for this reason the cars designed for export are equally well adapted for use at home.

Other Belgian exports which are increasing in volume are one- and two-ton trucks and motorcycles. An especially good market for motorcycles is found in the Balkans and Greece, the Belgian Congo and in Brazil.

## Townsend Highway Bill Passes Senate

### Measure Providing \$75,000,000 Goes Over With Commission Proviso Eliminated

WASHINGTON, Aug. 23—Eliminating the provision calling for the establishment of a Federal Highway Commission, the Senate to-day passed the Townsend highway bill appropriating \$75,000,000 for the construction and maintenance of roads, one-third of which will be available immediately and the balance to be distributed within six months. It was for the recognition of this highway commission plan that the automotive industry conducted a strong legislative campaign. The defeat was brought about by an unexpected eleventh-hour change of front on the part of Senate leaders. It is believed that the opposition developed not because of the industry's advocacy of it, but owing to the growing evidence of a reaction against bureaucracy or investment of power in new commissions.

#### Fight for Economies

Senators from the eastern states, where the highway system is fairly well developed, were quick to oppose the appropriation of \$100,000,000, as proposed by the Senate Committee on Post Office and Post Roads. Senator Lodge of Massachusetts, Republican leader in the Senate, insisted that it was only fair to the taxpayers of the country that economies should be made in road expenditures as well as in other forms of governmental enterprise. He declared that it would be at variance with the administration's program of economy if such large appropriations were sanctioned. An effort was made to cut the appropriation in half, but subsequently it was agreed to appropriate \$75,000,000.

The movement to abolish the highway commission, as proposed in the Townsend bill, was a distinct surprise to Senator Townsend and southern Senators who had heretofore opposed any change in the distribution of Federal funds, but later agreed to a compromise bill. Representative leaders declared that their action was based upon the fact that a report will be received shortly from the reorganization committee now planning the redistribution and reorganization of Government departments. It is believed that the control of highways, which is now vested in the Bureau of Public Roads, Department of Agriculture, will be transferred to a separate highway bureau in the proposed department of public roads, or to the Department of Commerce, because of the gradual recognition of the fact that highway transport and transportation affects business more than agricultural interests. For a time it appeared that the so-called agricultural "bloc" in the Senate had taken control of the highway bill, but developments showed that it was the drive of

### NORTHWESTERN BANK SEES BEGINNING OF END IN DEPRESSION

MINNEAPOLIS, Aug. 23—Economists have agreed that inasmuch as the Northwest was the first section of the country to begin liquidation, its recovery will mean the beginning of the end of depression in the United States. Conditions in this section undoubtedly are improving. In this connection the Northwestern National Bank, the largest in the Northwest, says in its monthly review of conditions:

"There has been a large carry over of obligations, and many of our trade difficulties caused by uneven readjustment processes have not been overcome; but in spite of disadvantages to surmount, the Northwest is definitely on the way to a recovery of its deferred prosperity. Bankers comment quite generally that the turn in affairs has come, although it will be far from a stampede toward affluence. Most of them believe that the present prices of grain and live stock, coupled with high freight costs, will make impossible a rapid or complete liquidation this season. Freight rates are the main factor out of the general alignment, to judge from the general comment."

the administrative leaders for economic limitation of commissions that changed the committee's bill.

The bill as reported from the committee would probably have passed with the commission plan intact if a delay had not been occasioned by the inquiry of Senator Pomerene as to the terms of the measure and his objection to a vote until delays could be given him. The Senate leader decided to rule adversely on the commission plan during the interim.

As a result of the debate on Tuesday it was decided that 60 per cent of all Federal funds should be expended on three-sevenths of the total mileage of any State and the remaining 40 per cent to be expended on the next 4 per cent of State roads, thus assuring interstate roads. This agreement is regarded as a forward step by the industry agents. The bill, when passed by the Senate, will go to conference, but will not become a law for several weeks as a result of the congressional recess.

#### OHIO LENS MAKERS BUSY

COLUMBUS, OHIO, Aug. 23—Lens manufacturers and agents are rushed to death in Ohio supplying the demand for anti-glare lenses. The State law defining the lenses to be used became effective Aug. 15 and the lens people have been reaping a harvest. The Ohio Highway Department has approved about three score of different lenses.

The rush of business is expected to last for a week at least.

## Packard Plans Big Advertising Drive

### \$200,000 Publicity Campaign Begun in Newspapers for Fall Business

DETROIT, Aug. 22—Packard Motor Car Co. has launched a \$200,000 advertising drive for fall business through the medium of local newspapers in all sections of the country. The drive will continue for five weeks and will be staged throughout in close co-operation with the distributor organization in each territory.

The potential fall market for cars is so large, officials said, that the company feels fully warranted in investing \$200,000 in developing it. There is no question, officials said, but that sales of cars from Sept. 1 can be brought up to a high level by a well-planned and well-executed campaign.

The introduction of the single-six line has brought a great increase in the number of Packard dealers, and this number is being constantly augmented. Cities and towns which formerly were too small for twin-six representation have now regular Packard dealers who are turning in steady streams of new business.

Orders at the factory are showing gains. On Aug. 19 production on twin-sixes was one month behind orders. Truck sales in the first ten days of August ran 59 per cent ahead of orders for the same period in July. The increase in twin-six business for August over July was considered remarkable at the factory in view of the heavy price reduction made in July.

Reports from territorial distributors show good business. Twin-six sales in Chicago for July equalled previous three months' business. Detroit retail sales in July ran in excess of \$250,000. Reports from New York and Philadelphia showed dealers sold out of touring cars and waiting deliveries. Single-six sales at the factory in July equalled the two previous months.

#### COLT WILL FILED

PROVIDENCE, R. I., Aug. 20—Under the will of Colonel Samuel P. Colt, which has been filed for probate here, \$410,000 was left in public bequests. Other specific bequests to individuals aggregated \$1,069,000, not including \$1,000 left to each employee of the Industrial Trust Co. Senator L. B. D. Colt, the Colonel's brother, and Russell G. Colt and Roswell E. Colt, his two sons, get \$100,000 each.

#### A. E. A. SEEKS SLOGAN

CHICAGO, Aug. 19—The Automotive Equipment Association, through its new merchandising director, Ray A. Sherman, has made an appeal to the industry for a slogan fitting the greater sales campaign now being waged by the association. All ideas for such a sales phrase are to be sent directly to Sherman, City Hall Square Building, Chicago.

## Gas Quality Rises as Prices Come Down

Survey Shows 25% Cut Was Accompanied by Increased Volatility

WASHINGTON, Aug. 22—Fears of automobile users that cheap gasoline would mean inferior grades have proven unfounded, as the fourth semi-annual motor gasoline survey conducted during July by the Bureau of Mines shows that a price cut of about 25 per cent was accompanied by an increased rather than lessened volatility of the product. The studies conducted in the larger cities of the country at all seasons indicated that the volatility of the gasoline was improved in the winter months, thus assuring better performance with the motor, especially at starting.

The bureau is convinced that the quality of gasoline to-day is much better than it was last summer, despite the price reduction. It is interesting to note that the average reduction in gasoline prices has been seven cents per gallon at tank wagon quotations.

At the end of May, 1921, there was over 800,000,000 gallons of gasoline in storage at the refineries, a figure never before reached in the history of the industry.

The increases noted in production and in stocks are sufficient to explain the drop in price and the improvement in volatility. It is interesting to note, however, that there is no uniformity in the relation throughout the country. Some cities show improvement in quality and little change in price, while in others the gasoline is similar to that sold a year ago, but the price has dropped markedly.

Exports of gasoline for the first five months of 1921 are larger than for the same period of 1920. For this period, shipments to our insular possessions and domestic consumption are also larger than they were a year ago, so the total outgo of gasoline for the first five months of 1921 is almost 200,000,000 gallons greater than it was for the corresponding period in 1920.

It is only in a study of production figures that the explanation is found. Production of gasoline for the first five months of 1921 was almost 400,000,000 gallons greater than for the same period in 1920. Imports were less, but the increase in the total income of gasoline is much greater than the increase in total outgo.

### NEW LEACH-BILTWELL "SIX"

LOS ANGELES, CAL., Aug. 23—The Leach-Biltwell Motor Car Co. has just brought out a new model of the Power-Plus Six, the first cars being displayed at the First Industrial Trade Exposition. While some of the mechanical details remain as before, the engine is entirely new, being made in the company's own plant. It has overhead valves and is said to develop over 100 hp. on the brake.

The cylinder dimensions are 3 3/4 x 5 1/4 in. The wheelbase has been lengthened to 134 in. Prices on all models have been set at \$6,500. Standard units include Delco ignition, Timken axles, Disteel wheels and Prest-O-Lite battery. The gearset is made by the company.

## New Orleans Ruling Would Affect Trucks

NEW ORLEANS, LA., Aug. 22—All motor vehicles with a combined weight of truck and load of more than two tons and all horse-drawn vehicles weighing, with load, more than 2300 pounds would be barred from certain residential streets of the city of New Orleans under the terms of a municipal ordinance just introduced in the city council by Commissioner of Public Safety Ray.

The ordinance also fixes size limits of motor trucks, specifying that no truck shall exceed 30 feet in length and, with trailer, two being allowed, shall not exceed 70 feet in length. Exceptions in the ordinance grant the barred vehicles the privilege of making immediate delivery within the limits specified or of taking on loads therein.

According to weight and tires the speed limit of motor trucks is fixed at from 15 to 20 miles per hour in the daytime and not more than ten miles per hour after nightfall. The ordinance also designates certain paved streets as heavy traffic avenues through which the vehicles forbidden to the residential section would be expected to pass.

## Canada Shows Gains in Exports to Australia

OTTAWA, ONT., Aug. 22—The increase in Canada's trade with Australia for rubber tires, tubes and solid tires during 1919-20 over the 1918-19 figures was quite remarkable, the increase being \$122,845, the total business for the 1919-20 period being \$304,430.

American imports fell off from \$434,626 to \$431,262, a slight loss of \$3,364.

Total importations from all sources in 1918-19 were valued at \$811,034 and for the next year \$884,590, an increase of \$73,556.

### NEW CAMERON TRACTORS

NEW YORK, Aug. 23—The Cameron Motors Corp., which recently took over the plant of the Dauch Mfg. Co. at Sandusky, Ohio, announces that it will bring out a new small, general purpose tractor under the trade name of Sandusky Model A. It will be equipped with a four-cylinder Cameron air-cooled motor and will be simple both in construction and design. The price will be \$425. The company asserts that its fuel consumption will be comparatively small. The Dauch Mfg. Co. has 300 dealers and Cameron Motors proposes to increase this organization by the addition of 700 more workers within the next week or so and as business necessitates.

## Sherman Gives Out A. E. A. Selling Plan

Chicago Manufacturers Ready to Support Idea—Vigorous Campaign to Start

CHICAGO, Aug. 20—Details of the merchandising plan of the Automotive Equipment Association, which was authorized at the Mackinac Island convention, were made public for the first time last evening at a meeting of the Association of Automotive Equipment Manufacturers by Ray W. Sherman, who recently left the Class Journal Co. to become the merchandising director of the A. E. A. The organization which heard the story last evening is made up of equipment manufacturers in the Chicago district, most of whom belong to the A. E. A. The manufacturers expressed their approval of the plan and gave assurances of their support for the work.

As a first step in the plan the association plans to enlist the assistance of the jobbing salesmen, many of whom have already won the approval of dealers by efforts to show how business profits may be increased without much increase in operating cost by installing automotive equipment departments. That the merchandising plan may be presented to the largest number of dealers in the shortest time a book on the subject is being prepared and will be ready for distribution this fall. The entire industry will lend its assistance to the distribution. Briefly described, the book will tell how to add to business profits by equipment sales and will tell how to sell.

Many meetings of jobbing organizations and also of dealers are planned.

The automotive equipment week, Aug. 6-13, proved successful and other national campaigns for the furtherance of business are planned.

## Limousine Top Making Practical Sedan Body

KALAMAZOO, MICH., Aug. 22—A practical type of sedan body for use in the equipment of the higher grade of automobiles has been worked out and designed by the engineering department of the Limousine Top Co. It will soon be regular production at this plant.

These bodies are built of leather inside and out, the body material corresponding exactly with the material used for seats and cushions, that is, in color effect. The side sections are set in heavy metal frames, bound in leather and are of the best grade of heavy French plate glass. They are easily adjustable and can be removed or put in place at will. When not in use these glazed leather side sections are carried in a well appointed case that folds under the front seat, thus being entirely out of the way.

The first body shown here was finished in a rich maroon leather, with maroon Spanish leather seats.

## Akron Production Waste \$20,000,000

Survey Shows Vast Losses in Rubber for 1919 and 1920—  
Could Save 15%

AKRON, Aug. 23—Millions of dollars are lost every year in the rubber industry in Akron through production waste, according to the statements of salvage experts, who estimate that the total production waste in 1919 and 1920 in Akron's rubber and tire factories amounted to nearly \$20,000,000.

Practically all tire companies here are training men scientifically to aid in salvaging waste materials, and also are conducting educational campaigns among factory operatives and tire builders, in an effort to increase efficiency and to eliminate avoidable production wastage. Salvage experts claim fully 15 per cent of the total waste in Akron's rubber plants each year can be eliminated as a result of such educational work, through the proper training of salvage men and through proper waste utilization.

The Goodyear Tire & Rubber Co. alone estimates that its production waste in 1919 and 1920 was \$6,880,878 as compared to a total production cost of \$156,023,307. This means a wastage percentage of production cost of 4.409 per cent.

### Can Save 15 Per Cent

At least 15 per cent of this can be saved if workmen, inspectors and foremen are alert, painstaking in their work and efficient, according to C. E. Falor, Goodyear salvage expert and manager of the company's by-products department which handles all matters pertaining to production wastage.

Much of the waste is salvaged, some of the salvaged material being re-absorbed in various departments and the remainder being sold. The sale of salvaged material by Goodyear last year amounted to \$1,181,954, while it is estimated that \$3,770,279 worth of salvaged wastage was absorbed in the manufacture of by-products. Friction wastage alone in 1919 and 1920, according to Falor, amounted to \$3,630,461. In addition to heavy rubber and fabric salvage, the company last year salvaged 5100 tons of scrap iron. By use of a large magnet for loading the scrap iron, a saving of over \$2,000 over the cost of man power for loading accrued, Falor states.

### Scrap Great Crop

"Next to wheat, scrap is one of America's greatest crops, and it takes men with scientific training to harvest it," states Falor. "We are using in our salvage work only men who have passed the foresight and mental alertness tests. Many of them are college graduates. There is a fast future for proper salvage work. It is a science in itself.

"The salvage department of any big corporation must be a service department, intended to assist rather than en-

force, and to help rather than to criticize in the work of reducing production wastage and increasing wastage salvage," states Falor. "It must back up its records with accurate statistics brought down to each individual if possible, to show each man's efficiency and to determine the extent of individual production wastage."

## New York Studebaker Predicts "Best Month"

NEW YORK, Aug. 22—The New York branch of the Studebaker Corp. reports that this month probably will be the best August in its history, although comparison with previous months indicates that the company is feeling some of the effects of seasonal let-up in automobile buying.

The best month the New York branch ever enjoyed was last June, when 451 vehicles were sold. July deliveries were 328 cars and indications are that August sales will run about 90 per cent of July, or something like 300 machines.

There is an unusually heavy demand for Studebaker closed cars in the Metropolitan district and some business is being lost every day because of inability to make immediate deliveries. The factory is expected to increase the proportion of closed cars to open models turned out from now on, and while sales of the latter may show some further falling off this fall and winter, sales of coupés, sedans and limousines are expected to be heavy.

## Ford Dealers in Mexico Agree Future Is Bright

HOUSTON, TEXAS, Aug. 22—More than 100 Ford dealers and agents in Old Mexico have been in Houston this week to discuss the situation in the southern republic with the officials of the branch Ford house here. From the reports gathered from these agents, the greater part of whom are Mexicans, the prospects for the automobile business in the Land of the Montezumas are exceedingly bright. They declared things are rapidly getting back to normal in Mexico and that since revolts and banditry have stopped and the people are following the peaceful pursuits of agriculture and stockraising, money is more plentiful and hence more cars are being bought.

The Mexican dealers declare what is greatly needed in Mexico now in addition to regular automobile houses is some big accessory house and that until such house is established at some central point the Mexican dealers will be compelled to be satisfied with meager supplies on hand and depend upon the Texas dealers for the main business.

The Mexican agents were greatly interested in tractors and trailers and were placing orders for what they could carry. They declared the Mexican ranchers and plantation owners are waking up to the value of these things and are in the market for them. They agreed conditions are brighter.

## Former Revere Head Seized on Charges

Stockholder Files Grand Larceny  
Complaint Against Newton  
Van Zandt

INDIANAPOLIS, IND., Aug. 20—A charge of grand larceny has been filed in city court at Logansport, Ind., against Newton Van Zandt, formerly president of the Revere Motor Car Corp. of Logansport.

The action was taken by John B. Porter of Buffalo, N. Y., a stockholder in the company. Porter also filed civil suit in the Cass circuit court against Van Zandt and the Revere Motor Corp. and its receiver, the Citizen's Loan & Trust Co. asking \$10,000 judgment. It is alleged in the complaint that the plaintiff, who is president of Blackburn, Inc., Buffalo, N. Y., bought \$4,050 of stock of the Revere Motor Corp., the purchase price being made through Van Zandt, president of the company at that time.

The complaint asserts that Van Zandt represented to the plaintiff that the Revere Motor Corp. had its output contracted for five years in advance, at a profit of \$500 a car, the contract being with a New York firm. The plaintiff asserts that he later learned there was no such contract. Word received here this morning is to the effect that Van Zandt has been arrested in Philadelphia, but dispatches did not say whether he would fight extradition to Indiana.

## Acceptance of Ford's Nitrate Offer Urged

WASHINGTON, Aug. 22—Approval of Henry Ford's offer for the purchase of the Muscle Shoals, Ala., nitrate plant and lease of the dams is urged by James E. Smith of St. Louis, vice-president of the Mississippi Valley Waterway Association, and other officers of that organization. They say that if the plants were completed and their operation assured, more than 150 miles of land rich in iron, coal and other valuable deposits would be open to development along the upper Tennessee River.

### WHEEL PLANTS BUSY

DETROIT, Aug. 22—Prudden Auto Wheel, Gier Pressed Steel and Motor Wheel plants of the Motor Wheel Corp. are now operating on a full six day week. Motor Wheel plant has increased the number of men on its payrolls from 600 to 1075; Prudden is now employing 750, and Gier, from almost complete suspension 60 days ago, is now employing 175. Die and toolmaking divisions at the Gier plant have been working overtime preparing to go into production on new contracts signed during the dull season. The general atmosphere around the plant indicates brisk business. Every day finds a greater volume gotten out at the three plants.

## Texas Relieved as Truck Bill Passes

### Objectionable Features Are Eliminated from Measure Regulating Commercial Vehicles

AUSTIN, TEXAS, Aug. 23—Motor truck dealers and operators of these vehicles are much relieved by the passage of a bill by the Legislature repealing the more objectionable features of the "motor truck law" which was enacted at the last regular session of the law-making body. As the measure finally passed both branches it increases the annual license fee on commercial motor vehicles according to net carrying capacity and tire equipment, but the mileage tax imposed by the regular session of this Legislature is eliminated. Trucks and tractors used exclusively for agricultural purposes are exempted from the special license fees stipulated in the bill, but it is provided that license fees shall be paid on agricultural trucks according to horse power just as now paid by automobiles. Fees for tractors not used for agricultural purposes are based on weight.

Under an amendment adopted by the conference committee a license shall not be issued to any truck of more than four tons carrying capacity, except on written application to the Highway Commission showing that roads would not be injured by such trucks. The bill provides, however, that no license shall be issued to trucks of more than 5-ton carrying capacity.

#### Some of the Rules

Another section of the bill provides that county road superintendents or supervisors may during wet weather prohibit the use of any highway to loads of such weight as would damage the roads.

Speed limits are fixed according to gross weight of vehicle and load and according to tire equipment. Pneumatic tire equipment is favored in this as well as in the case of license fees, higher speed limits being allowed vehicles equipped with pneumatic tires as lower license fees have been provided for such vehicles.

All trucks must be equipped with rear-view mirrors and no truck shall operate with solid tires less than 1 inch in thickness at any point or with pneumatic tires where one of such tires is missing. Drivers operating cars in this condition are subject to penalty of not more than \$200 as are also those drivers who operate vehicles of more than 4-ton carrying capacity without special permit.

Following is the scale of license fees provided for commercial motor vehicles, which are defined as any motor vehicles designed for the transportation of property:

Carrying capacity—1 to 2000 lbs., pneumatic tires, \$15; solid tires, \$18; 2001 to 3000 lbs., pneumatic tires, \$30; solid tires, \$36; 3001 to 4000 lbs., pneumatic tires, \$40; solid tires, \$48; 4001 to 5000 lbs., pneumatic tires, \$50; solid tires, \$60; 5001 to 6000 lbs., pneumatic tires, \$65; solid tires, \$78; 6001 to 7000 lbs., pneumatic tires, \$80; solid tires, \$96; 7001 to 8000

lbs., pneumatic tires, \$100; solid tires, \$120; 8001 to 9000 lbs., pneumatic tires, \$120; solid tires, \$144; 9001 to 10,000 lbs., pneumatic tires, \$150; solid tires, \$180.

For each trailer or semi-trailer drawn by a commercial vehicle or tractor, per 100 lbs. gross weight of vehicle and capacity load equipped with pneumatic tires, 15 cents; solid rubber tires, 25 cents; iron, steel or other hard tires, 35 cents.

Provided that semi-trailers equipped with iron, steel or other hard tires shall pay at the rate of \$1 per 100 lbs. of gross weight as specified under this section.

For tractors, the annual license fee shall be based upon the weight of the tractors as follows: 1 to 2000 lbs., \$5; 2000 to 4000 lbs., \$10; 4000 to 6000 lbs., \$15; 6000 to 8000 lbs., \$20; 8000 to 10,000 lbs., \$25.

Following is the speed limit scale. Commercial motor vehicles equipped with pneumatic tires, maximum weight in pounds, including gross weight of vehicle and load:

2001 to 4000, 22 m.p.h.; 4001 to 6000, 18 m.p.h.; 6001 to 8000, 15 m.p.h.; 8001 to 10,000, 12 m.p.h.; 10,000 to 12,000, 10 m.p.h.

Commercial motor vehicles equipped with solid rubber tires, maximum weights in pounds, including gross weight of vehicle and load:

1500 to 2000, 20 m.p.h.; 2001 to 6000, 15 m.p.h.; 6001 to 8000, 12 m.p.h.; 8001 to 10,000, 10 m.p.h.

## Civilian Air Board Bill Is Introduced

WASHINGTON, Aug. 25—Senator Wadsworth of New York to-day introduced a bill in the Senate providing for establishment of commission of civilian aeronautics. The bill is said to represent plans of permanent aviation engineers and aircraft manufacturers, many of whom are identified with the automotive industry. The bill, which has been referred to the Senate Committee on Commerce, provides for a commissioner at a salary of \$7,500 and assistant commissioner at \$5,000 with a necessary clerical force. The bill as drafted would give the commission authority to investigate and design the construction of all aircraft and if approved to license all civil aircraft, to regulate navigation and operation of civil aircraft with established rules and regulations, to foster aeronautics by designating, mapping and approving of layout air course and to control all civil aeronautics.

## ZR-2 Is Destroyed; Loss of Life Heavy

NEW YORK, Aug. 25—The dirigible ZR-2 which was built in England for the American Navy was completely destroyed in an accident during a trial trip near Hull, England, yesterday, and 43 of the 48 occupants perished, including 16 out of 17 Americans on board. The ZR-2 was the largest dirigible ever built, being 695 ft. long, 84 ft. 4 in. in diameter and having a gas capacity of 2,700,000 cu. ft. From the reports of eye witnesses and survivors of the disaster it appears that some of the girder work of the hull near the middle of its length gave way and the gigantic structure practically broke in two in the middle. This was followed by a number of terrific explosions, the last one occurring as part of the hull came down on the Humber River. The ZR-2 had been in the air a total of 35 hours up to the time the accident occurred, but it appears that this was the first time she was going under full power.

## Detroit Sees First Trackless Trolley

### Packard Demonstrates Working Model—Five Other Bids Received by Mayor

DETROIT, Aug. 23—Packard Motor Car Co. demonstrated here to-day its first trackless trolley bus, the vehicle being built in conjunction with Westinghouse Electric & Mfg. Co., as a working model for operation on the new municipally owned trolley lines in this city.

The bus was built to meet specifications designed by city officials, and if present plans are carried out 50 will be ordered for immediate operation in city streets. President Alvan Macauley of Packard said the company could deliver this number in six weeks if the order is given. The estimated cost is \$8,065 each.

Other bids were received, but Packard was the only company to furnish a working model. Other bidders were: J. G. Brill Co., Philadelphia, \$8,744; Standard Motor Co., Detroit, \$8,950; National Safety Car & Equipment Co., St. Louis, \$7,325; St. Louis Car Co., \$7,800; International Motor Truck Corp., Detroit, \$9,988.

#### Mayor Is Impressed

Mayor Couzens, much impressed with the possibilities of the vehicle for public transportation, said:

"I do not wish to appear definitely committed to this type of car, but from what I have seen I believe it can be used very successfully in conjunction with our municipal lines and, with time, developed to give adequate service in the downtown district."

The street railway commission of the city was represented by Commissioners William B. Mayo and G. O. Ellis, the former, chief engineer of the Ford Motor Co. Though each considered the bus practical for suburban districts, they said it would have to be considerably developed to meet requirements of transit on busy streets. Further action will be taken at a meeting this week.

The vehicle used to-day followed the usual bus outlines except for the double trolley pole on the roof. It was 24 ft. long, 8 ft. wide and weighed 11,500 lb. The model used to-day seats 29 persons, but the design which the Packard company plans will seat about 40.

Through the special trolley arrangement the bus was enabled to range from one curb-line to the opposite one. Its turning area was small, considering its size.

Control of the bus, both power and brakes, is worked by the feet of the operator. There is also an emergency hand-brake. Power is thrown on and off by a treadle. There are two speeds, 15 and 25 miles an hour, all regulated by foot pressure. Both hands of the operator are free to steer and to handle fares and the single door.

## Graham Reimports Measure Is Held Up

### 90% Duty Feature Meets with the Objections of Senator Pomerene

WASHINGTON, Aug. 23—Objection of Senator Pomerene, Democrat, of Ohio, to the consideration of the joint resolution imposing a duty of 90 per cent on all reimported army supplies, including automobiles and trucks, temporarily delayed the passage of this measure in the Senate this week. It is believed, however, that it will pass after the Congressional recess.

#### Contained Amendment

The Graham resolution as reported by Senator Watson, of Indiana, from the Senate Committee on Finance, contained an amendment drafted by the committee. The amendment provided that the provisions of the resolution should not apply to "any goods, wares, merchandise or military or naval supplies purchased prior to Aug. 15, 1921, by any citizen of the United States, or by any partnership, corporation, or association created or organized in the United States, and exported to the United States prior to Nov. 1, 1921, if (1) such purchases are certified to by the United States consul, and (2) such citizen, partnership, corporation, or association files within 45 days after the approval of this resolution with the Secretary of the Treasury and the United States consul a certified copy of the instrument of purchase of such goods, wares, merchandise, or military or naval supplies. The term 'United States consul' means the United States consul in the country from which such goods, wares, merchandise, or military or naval supplies are exported to the United States who certified to the consular invoices."

#### Senator Watson Speaks

Senator Watson stated that the amendment was drafted by the committee in response to the plea of American second-hand goods dealers and certain groups of bankers who have financed them. He further stated that these citizens had purchased in the aggregate about \$6,000,000 worth of goods, some of it on the high seas in transit to this country; some at the ports awaiting shipment, and some on cars waiting to be transported to ports for shipment. The Committee on Finance believes, inasmuch as these goods were purchased by American citizens in good faith; inasmuch as banks had loaned them money with which to make the purchase, and inasmuch as credit has been established in France on the borrowings thus made, it would be unfair to exclude these goods from coming into the United States. Hence, they drew up an amendment allowing them to enter until Nov. 1.

American truck manufacturers and dealers were largely responsible for this

resolution because they suffered keenly from the effects of unfair competition. The fact that the Senate Finance Committee consented to delay the imposition of the duty was not at all to their liking, because they believed that legitimate business enterprise should have protection rather than organized speculators in war supplies. It is claimed that speculators are free from many of the burdensome taxes imposed on legitimate dealers and manufacturers. There is a possibility that the Senate may strike out the committee amendment and pass the Graham resolution in its original form in order to prevent delay in the enactment of this important legislation.

## Post-Whitney Plans Fall Tractor Sale

CLEVELAND, Aug. 19—The Post-Whitney Co., a consolidation of the Post Tractor Co. of Cleveland, the Whitney Tractor Co. of Upper Sandusky and the Chief Motor Co. of Port Huron, has made plans for the sale and distribution of a large number of tractors in the next 16 months.

## S.A.E. to Have Winter Meeting Jan. 10 to 13

### Many Subjects to Be Discussed at Annual Conference of Engineers

NEW YORK, Aug. 23—The Meetings Committee of the Society of Automotive Engineers has announced that the Annual Meeting of the Society will be held at the United Engineering Societies Building, New York, Jan. 10 to 13, inclusive, Tuesday, Wednesday, Thursday and Friday, of New York Automobile Show Week.

The meeting will open as usual with a session of the Standards Committee, the only event scheduled for Tuesday. Business and professional sessions will be held on Wednesday, probably morning and afternoon. The annual carnival is planned for a late hour Wednesday evening. Professional sessions will be held on Thursday and probably on Friday. The annual dinner is scheduled for Thursday evening, as usual.

## Statement Showing General Motors Sales for Passenger Cars, Trucks and Tractors

NEW YORK, Aug. 25—Passenger and commercial car sales by Divisions of General Motors Corporation, as reported to the National Automobile Chamber of Commerce, follow:

1921	First Quarter	Second Quarter	Six Months
<b>Passenger Cars:</b>			
Buick .....	9,945	19,020	28,965
Cadillac .....	1,394	3,484	4,878
Chevrolet .....	5,007	20,153	25,160
Oakland .....	2,775	3,598	6,373
Oldsmobile .....	4,976	6,385	11,361
Scripps-Booth .....	532	929	1,461
<b>Commercial Cars:</b>			
Chevrolet trucks.....	466	863	1,329
GMC trucks.....	491	801	1,292
Oldsmobile trucks.....	15	...	15
<b>Totals:</b>			
Passenger cars.....	24,629	53,569	78,198
Commercial cars.....	972	1,664	2,636
Miscellaneous* .....	3,660	7,359	11,049
Grand total.....	29,261	62,622	91,883

Sales for the past four calendar years follow:

Years Ended Dec. 31	1920	1919	1918	1917
<b>Passenger Cars:</b>				
Buick .....	111,215	115,405	74,856	117,300
Cadillac .....	19,826	19,801	12,279	19,692
Chevrolet .....	126,397	127,362	81,435	109,111
Oakland .....	36,155	51,901	24,110	33,951
Oldsmobile .....	25,713	33,345	18,822	22,045
Scripps-Booth .....	8,779	8,128	4,098	2,545
<b>Commercial Cars:</b>				
Chevrolet trucks.....	13,651	6,098	384	2,604
GMC trucks.....	5,137	7,729	8,997	5,861
Oldsmobile trucks.....	8,239	7,782	30	15
<b>Totals:</b>				
Passenger cars.....	328,085	355,942	215,510	304,644
Commercial cars.....	27,027	21,609	9,411	8,540
Miscellaneous* .....	36,421	28,607	21,913	11,319
Grand total.....	391,533	406,158	246,834	324,503

\*Consists of tractors; McLaughlin, Chevrolet and Olds cars produced and sold in Canada, and therefore not included in reports to National Automobile Chamber of Commerce; and also Buick and Cadillac commercial cars.

## Manufacture Fast Becoming Fine Art

### Some Detroit Plants Sacrificing Schedules to Keep Product at High Standards

DETROIT, Aug. 23—Automobile manufacturing to-day is nearer the fine art period than at any time in its history. With the rush for production steadied down to a regular demand, the factories are concentrating on turning out the very best product possible at the price.

In some factories such extreme care is being exercised that it often happens daily production schedules are sacrificed to keep the product up to high standard. This is in spite of the fact that daily production is based on sales, and failure to meet schedules means falling behind.

Building for the future is the watchword of the industry to-day. Every bit of material and work is carefully inspected, and parts or assembly work which fail to come up to requirements are turned back for rebuilding. Nothing is being passed about which there is any doubt, and every automobile turned out represents a 100 per cent perfect job.

In this fine building period the industry is benefited greatly by the high class of workmen now available. The type of man found in the automobile factories to-day is probably the most expert mechanical type in the country. The industry has had the pick of many industries owing to the general depression and it has made the best of it.

The indifferent worker who found place during the exigencies of the post-war rush is gone. In his place is the highest type workman the industry has known. The honor system is largely prevalent, each man being relied upon to see that his end of the work matches up with general excellence of the completed job.

There is no such thing to-day as labor turnover in the sense that applied during the rush period. Men are not leaving their jobs to-day voluntarily. Jobs are at a premium, and as a result the factories are getting better co-operation than they have in years, and all of this is reflected in the finished car.

### Delay Building Truck Plant for Harvester

FORT WAYNE, IND., Aug. 20—Construction work on the motor truck plant of the International Harvester Co. in this city will not be started until next spring. An extension of eight months has been granted by the Greater Fort Wayne Development Corp. which has a contract for the building.

That the plant will be developed according to the original plans is indicated in the following letter from the Harvester company:

"In requesting this further extension we desire to assure the Development company and all concerned that our com-

pany has never entertained for a moment any doubt of ultimate execution of the contract referred to or of the carrying out of its plans for the development of a Fort Wayne plant as heretofore declared to you. With us the question is solely one of time. Our reason for asking this further extension is to be found as before in the present and prospective conditions of our business, of finance and of building costs."

### No Angus Sanderson Cash to Creditors

LONDON, Aug. 12 (*By Mail*)—Creditors and shareholders of the Angus Sanderson Co. were told this week the sad story of the failure of an enterprise which began as a well-paying, high-class body building business and agency for high-grade cars, but which joined later with associated interests to produce the Angus Sanderson car.

The car production business began with the purchase of the Birtley projectile factory with 51 acres of land in 1919 for \$1,125,000 (normal exchange), payable part in cash and the remainder in 10 yearly installments. In April, 1920, a loss of \$946,590 had been incurred and on Dec. 20 of that year there was a further loss of \$817,715.

The accounts filed in the proceedings disclosed total liabilities of \$4,442,465. The total deficiency in regard to stockholders is \$1,513,325. Representatives of the debenture holders stated at the meeting it was doubtful whether there would be anything for the creditors, as the assets probably would lack \$400,000 of being sufficient to pay even the debenture holders.

No statement was made as to the cause of the failure, but the creditors expressed the view that it was due entirely to mismanagement.

The business will be liquidated by the official receiver, but the manufacture of Angus Sanderson cars is being continued with new financial aid in the works of the Tylor Co. in North London, and the output is declared to be increasing.

### Plan Distribution of Hayes Wheel Products

DETROIT, Aug. 22—National distribution of Hayes Wheel Co. products was discussed at a meeting of executives and distributors held at the Jackson factory, this month. In connection with the meeting an exhibit of wheels and component parts was shown, the new demountable at rim wheel being featured. The company plans to build its business in the United States and abroad around this type of wheel.

Addresses by dealers and officials showed complete confidence in the future of the automobile business in general and the wheel part of it in particular. Among those who spoke were W. D. Blood, head of W. D. Blood Co., New York, export agents for Hayes products; President C. B. Hayes, G. S. Porter, Sargent Ziegenbien, C. F. Field and Brundage.

## \$70,537,620 Assets for Maxwell Motor

### First Financial Statement Issued by New Organization—Presi- dent Wilson Talks

DETROIT, Aug. 22—The first financial statement issued by the new organization of the Maxwell Motor Corp. shows total assets of \$70,537,620.28, as of June 1. Cash in bank and receivable from the reorganization committee totals, with certificates of deposit, \$7,931,361.34. Inventory stands at \$16,166,867.05. Current assets are shown as \$28,615,098.87, as against current liabilities of \$1,855,179.98.

Commenting on the statement, President W. R. Wilson said:

"Assets in plants and equipment have been conservatively valued and adequate depreciation maintained, and the value of inventories has also received depreciation consistent with the fall of market prices, with substantial allowance for any further loss from this or other causes.

"Inventories of the corporation are only a little more than 60 per cent of those of the old company a year ago, and sales have been affected to such an extent that the number of cars and trucks in inventory is only slightly in excess of daily production, and the number of cars in the hands of distributors and dealers throughout the country is less than normal.

"Your corporation embarks upon its undertaking with bright prospects. During the immediate future and pending the return of better business efforts will be concentrated upon further improvement of the company's product, reduction of cost, conservation of cash, welfare of its distributors and dealers, and consolidation of its position. In other words, efforts of general preparedness for the increased volume of business which it is believed will be available in the industry within the next twelve months period."

### Dutch East Indies Now Fertile Motor Car Field

SEATTLE, Aug. 22—Information received here from Batavia, Java, shows that the Dutch East Indies present one of the most fertile fields in the Pacific Ocean trade mart for American motor vehicles. The total number of automobiles in use in the Dutch East Indies is now estimated at 15,500. Since 1915 nearly all of the cars imported have been of American manufacture.

One of the features of the automotive trade in Java, the chief island of the group, is the development of motor truck transportation. Between Sorabaya, one of the leading ports, and Tandjung Perak two hundred motor trucks are now required to take care of the daily freight traffic. The trucks are of 1½ to 2 tons capacity.

The market in the Dutch East Indies for tires is also very good under normal conditions. Imports of tires last year numbered more than 200,000, as compared with 94,508 during 1918.

## Bay State in Throes of a Headlight Law

### Lens Makers Working Night and Day But Cannot Supply Demand

BOSTON, Aug. 23—Massachusetts is now in the throes of a headlight law with a scarcity of lenses to meet it, and thousands of motorists are going about frantically trying to get what they want in the way of new lights. Many of them waited until the last minute, as they do in registering. And the makers of lenses have been working night and day to get goods here, but not enough were available. One lens man stated that if he had 10 carloads in Boston, dealers from all over the State and from some of the other States would be racing in to get their share, fighting with the Boston dealers anxious to take the whole shipment.

#### Time for Hustling

It is a time of hustle and make money for the accessory people, and some of the car dealers have taken a hand in adding a little money to their finances by selling bulbs and lenses, also doing a focus business. All over the State men are opening up focussing stations and charging from 50c. up to take care of motorists' wants. General focussing costs an average of about \$1. Then there is the profit on the sale of 21 candlepower bulbs, and lenses. Also there is shop work when brackets are to be bent down. As one accessory man remarked to-day, discussing the sales: "God and the highway commission were good to us just when we needed help."

A lot of the motorists are trying to do their own focussing and the placing of the lenses. The State Motor Vehicle Department has had printed some cards giving directions for doing this work. But some of them are not having much satisfaction as they have bought the wrong size lens, or do not know how to put them in properly, with the result that it is not unusual to find on main traveled roads broken lenses every few hundred yards, or meet with cars whose lights are out of focus.

#### Warning Tags for Cars

It is doubtful if the law will be of much use for several weeks. Meanwhile the police chiefs of Massachusetts have all received letters with a lot of warning tags to place on cars not properly fitted with lenses when they see them parked by day. These warning tags will tell the owner he cannot operate his car at night until it meets the law's requirements, and the number is sent to the Motor Vehicle Registrar's office where it will be checked up. A second report of not being equipped will cause suspension of the license to drive, and perhaps the registration of the car. The owner, too, will be in jeopardy if he has an accident, for not being lawfully equipped and the burden of blame would be on him.

### Exports of Automobiles, Airplanes, Trucks, Farm Tractors, Motorcycles and Parts for July and Six Previous Months

### Seizure of "Hooch" Cars Worries Southern Dealers

BIRMINGHAM, ALA., Aug. 20—Action on the part of county and federal authorities of condemning automobiles seized for carrying alcoholic liquors in violation of the prohibition laws is giving dealers in this district no small amount of trouble.

The latest instance is a car sold by the Pryor Motor Co. on which there was a balance of \$1,250. This car was not in possession of the buyer when seized for alleged transportation of whiskey. It was taken by deputy sheriffs and was being turned over to federal authorities for condemnation and sale at auction when the Pryor company got an injunction to prevent this action.

When cars are thus turned over to federal authorities without the lien held by the company selling it being filed in court, the company has no claim on it. It was for this purpose the injunction was secured.

If motor companies file their liens in time there is a chance of recovering their cars, but many times they are ignorant of the seizures and cannot do so.

While most of the cars used for the purpose of illicit liquor traffic are second-hand ones, a number of dealers have lost high priced cars through seizure. They were, of course, unaware that their cars were being used for such purposes.

#### HENDEE FILES PROTEST

SPRINGFIELD, MASS., Aug. 20—The Hendee Mfg. Co. of this city, motorcycle manufacturer, it is announced, has filed a protest with the Senate Finance Committee at Washington, protesting against the proposed duty on bicycles, motorcycles and parts, as contained in the Fordney bill, saying that in common with other manufacturers the company believes the provision would harm the industry. The company states that foreign competition is not feared and, furthermore, would stimulate the industry.

### Scandinavian Trade Looks Better for 1922

STOCKHOLM, Aug. 5—(By Mail)—While the 1921 automobile season has been the worst on record in Scandinavia, indications are that with the improvement in general conditions the market will be much stronger next February and March. The public has awakened to the fact that American cars are best suited for use in Norway and Sweden, as the motor car driver in these countries needs power more than anything else.

There is no market in prospect for trucks of any size above 2½-ton capacity. Buyers now all specify pneumatic tire equipment. Electric lighting is asked for, but not electric starters in all cases. Buyers favor low frame height to facilitate loading and discharging. American manufacturers should consider the double pneumatic tire and rear equipment similar to that of the Fiat and should not let tire sizes exceed 33 x 4½.

The conditions generally are brighter than they have been in the country in some time past.

#### REDUCE VICTOR TRUCK CLAIM

DETROIT, Aug. 22—The claim of Alfred F. Rick of Baroda against the Victor Truck Co., St. Joseph, Mich., has been reduced by the referee in bankruptcy from \$40,160 to \$8,946. Rick was treasurer of the company. A claim for stock which the company was said to have given gratis was disallowed on the ground that no corporation could give stock to officers or directors without adequate consideration.

#### ASK CLAIRMONT RECEIVER

INDIANAPOLIS, IND., Aug. 22—Judge Solon J. Carter of Superior Court, this city, has been asked to appoint a receiver for the Clairmont Reynolds Body Co. The petition for a receiver was asked by Alva C. Robbins.

## Flying Exhibition to Be Held in Paris

### French Airplane Manufacturers Expect to Cover All Phases of Industry

PARIS, Aug. 12 (*By Mail*)—French airplane and kindred manufacturers will hold an aviation exhibition in the Grand Palais, Paris, from Nov. 12 to 27. This event will unite all types of flying machines and will cover every phase of aerial navigation.

The first international aerial navigation congress in Europe is announced during the period of the Paris aviation show, from Nov. 15 to 26.

The congress is divided into two sections, dealing respectively with the techniques of flying and aerial navigation. Eight main subjects are provided for in the discussions, as follows: (1) Application on full size machines of results obtained on small models in the aerodynamic wind tunnel. (2) Commercial airplanes and flying boats; thick and thin wings; all-metal construction. (3) Big capacity airships. (4) Airplane engines for commercial services. (5) Instruments for plotting an aerial route and determining position. (6) The formation of aerial highways; the installation of airdromes and their operation. (7) Commercial aerial navigation; organization and operation of aerial transport lines; aerial mail. (8) Aerial traffic regulations; examination of pilots; safety; insurance.

### Jersey City Will Have Motor Show This Year

JERSEY CITY, Aug. 20—Jersey City will have another automobile show this year, its second, the success of the initial one held last fall being so great it incited the members of the Hudson County Automobile Trade Association, who sponsored the event, to even greater efforts than they made last year. As in 1920, the display will be held in the Fourth Regiment Armory, and the demand for space greatly exceeds that of the first exhibition. At least 25 makes of passenger cars will be on view, every one of them representative products of the leading American manufacturers. There will also be a display of accessories worthy of inspection, while special days will include many features, the programs of which will be announced later.

Elmer E. Hallinger is president of the Hudson County Automobile Trade Association this year and he will be ably assisted by his fellow officers in carrying out the organization's plans. These include A. R. Southworth, vice-president; H. V. Lehman, treasurer; A. W. Elder, secretary, and Duncan Stuart, recording secretary. F. W. Payne, who was manager of the show last year, has again been retained in the same capacity.

## Complete Program of State Fairs Scheduled Throughout United States During 1921-1922

Alabama—State Fair, Birmingham, Oct. 3-8.  
Arizona—State Fair, Phoenix.

California—State Fair, Sacramento, Sept. 3-11.

Canada—Calgary Industrial Exhibition, Calgary, June 30-July 8; Canada's Great Eastern Exhibit, Sherbrooke, Que., Aug. 27-Sept. 3; Canadian National Exhibition, Toronto, Ont., Aug. 27-Sept. 10; Central Canada Exhibition Association, Ottawa, Ont., Sept. 9-19; Edmonton Exposition, Edmonton, Alberta, July 8-16; Quebec Provincial Exposition, Quebec-Next Westminster, B. C., Sept. 12-17; Vancouver Exposition, Vancouver, B. C., Aug. 13-20; Western Fair, London, Sept. 10-17.

Colorado—State Fair, Pueblo, Sept. 26-30; National Western Stock Show, Denver, Jan. 14-21, 1922.

Connecticut—Connecticut Fair Association, Hartford, Sept. 5-10.

Florida—State Fair, Jacksonville.

Georgia—State Fair, Macon, Oct. 27-Nov. 5; Southeastern Fair Association, Atlanta, Oct. 15-25.

Idaho—State Fair, Boise, Sept. 26-Oct. 1.

Illinois—Illinois and Indiana Fair Association, Danville, Aug. 27-Sept. 3; State Fair, Springfield, Aug. 19-27; International Live Stock Association, Chicago, Nov. 26-Dec. 3; Kankakee Inter-State Fair, Kankakee, Aug. 15-19.

Indiana—State Fair, Indianapolis, Sept. 5-10; Inter-State Fair Association, South Bend, Sept. 12-17.

Iowa—Inter-State Fair, Sioux City, Sept. 18-24; Iowa State Fair and Exposition, Des Moines, Aug. 24-Sept. 2; National Swine Show and Exposition, Des Moines.

Kansas—State Fair, Hutchinson, Sept. 17-23; Free Fair, Topeka, Sept. 12-17.

Kentucky—State Fair, Louisville, Sept. 11-17.  
Louisiana—State Fair, Shreveport, Oct. 27-Nov. 6.

Maryland—Hagerstown Interstate Fair, Hagerstown.

Massachusetts—Eastern States Exposition, Springfield, Sept. 13-24.

Michigan—State Fair, Detroit, Sept. 2-11.

Minnesota—State Fair, Hamline, Sept. 3-10; South St. Paul Stock and Feeder Show, South St. Paul.

Missouri—American Royal Live Stock Show, Kansas City, Nov. 12-19.

Mississippi—State Fair, Jackson, Oct. 17-22; Mississippi-Alabama Fair, Meridian, Oct. 10-15.

Montana—Midland Empire Fair, Billings, Sept. 19-23; State Fair, Helena, Sept. 12-17.  
Nebraska—Ak-sar-ben, Omaha, Sept. 13-24; State Fair, Lincoln, Sept. 4-9.

New Jersey—Trenton Interstate Fair of New Jersey, Trenton, Sept. 26-30.

New York—State Fair, Syracuse, Sept. 12-17; Rochester Exposition, Rochester, Sept. 5-10.

North Carolina—State Fair, Raleigh, Oct. 17-22.

North Dakota—State Fair, Grand Forks, July 18-23; State Fair, Fargo, July 11-16.

Ohio—State Fair, Columbus, Aug. 29-Sept. 3.  
Oklahoma—Free State Fair, Muskogee, Oct. 3-8; State Fair and Exposition, Oklahoma City, Sept. 24-Oct. 1.

Oregon—State Fair, Salem, Sept. 26-Oct. 1; Pacific International Live Stock Exposition, Portland, Nov. 5-12.

Pennsylvania—Erie Exposition, Erie, Aug. 22-27.

South Carolina—State Fair, Columbia, Oct. 24-28.

South Dakota—State Fair, Huron, Sept. 12-17.

Tennessee—Chattanooga Interstate Fair, Chattanooga, Oct. 1-8; East Tennessee Division Fair, Knoxville, Sept. 26-Oct. 1; Memphis Tri-State Fair, Memphis, Sept. 24-Oct. 1; State Fair, Nashville, Sept. 17-24; West Tennessee District Fair, Jackson, Sept. 12-17.

Texas—South Texas State Fair, Beaumont, Nov. 10-19; Southwestern Exposition and Fat Stock Show, Fort Worth, March 5-12, 1922; State Fair, Dallas, Oct. 8-23; Texas Cotton Palace Association, Waco.

Utah—State Fair, Salt Lake City, Oct. 3-8.

Vermont—State Fair, White River Junction, Oct. 3-6.

Virginia—Staunton, Virginia, Fair, Staunton, Sept. 5-10; State Fair, Richmond, Sept. 1-8.

Washington—Spokane Interstate Fair and Live Stock Show, Spokane, Sept. 5-10; State Fair, Yakima.

West Virginia—State Fair, Wheeling, Sept. 5-10.

Wisconsin—Northern Wisconsin State Fair, Chippewa Falls, Sept. 12-16; State Fair, Milwaukee, Aug. 29-Sept. 3.

Wyoming—State Fair, Douglas, Sept. 13-16.

#### ADDITIONAL FAIRS

Blue Grass Fair Association, Lexington, Ky., Sept. 5-10.

International Wheat Shows, Fair and Exposition, Wichita, Kan., Sept. 26-Oct. 3.

Inter-State Fair, La Crosse, Wis., Sept. 2-23.

Ozark Stock Show, Springfield, Mo., Oct. 3-8.

Dairy Cattle Congress and International Belgian Horse, Waterloo, Iowa, Sept. 26-Oct. 2.

National Dairy Show, St. Paul, Minn., Oct. 8-15.

National Implement and Vehicle Show and Peoria District Fair, Peoria, Ill., Sept. 30-Oct. 8.

National Swine Show, Peoria, Ill., Oct. 3-8.

West Michigan State Fair, Grand Rapids, Mich., Sept. 17-22.

### Buenos Aires Seeking License Plate Samples

WASHINGTON, Aug. 24—The municipality of the city of Buenos Aires, Argentina, desires samples or models of luminous number plates for automobiles for use in that city. The text of the invitation is available to manufacturers and others interested from the Bureau of Foreign and Domestic Commerce. It is stated a business of considerable volume should be afforded for the successful contestant.

### Survey Shows Need for Canadian Lines Abroad

OTTAWA, ONT., Aug. 20—Acting on instructions from the Trade and Commerce Department, L. E. Wolgess, Canadian Government Trade Commissioner, has visited Roumania, Hungary, Czechoslovakia, Austria, Turkey and Jugoslavia and the trade report has now been issued in book form under the title of "Trade of the New Countries of South-east Europe." A list of possible openings for Canadian goods is supplied.

## METAL MARKETS

**A** HIGHLY interesting period in the shaping of the steel market is imminent. While August statistics of production and unfilled tonnages are not likely to disclose startling gains, they will undoubtedly reflect the turn for the better that has come over the market, and it remains to be seen how the minds of the rank and file of producers will react to this changed order of things, following the dreary months through which the industry has passed. While the large interests, far from building castles in the air, recognize only too well that the demand is still a plant of very tender growth, calling for the most careful nursing, one encounters here and there smaller producers whose psychological make-up is such as to preclude interpretation of even slightly increased production, and orders in any other light than as a forerunner of a rising market or justification for such advances. There are those whose minds lean in this direction and who even now point to the pig iron market as an example that rising values beget of themselves more active demand. They make much of the fact that at \$18 pig iron went begging, whereas now that the market has recovered to approximately \$20, there is a relatively active demand in evidence. They overlook, however, that, although it is difficult to dissociate steel from its chief raw material, the pig iron and steel markets have very little in common as to marketing conditions. The former, even in normal times, is more or less susceptible to semi-speculative influences, whereas the latter is amid ordinary conditions a manufacturing affair in which regularity of outlet is of far more importance than ephemeral gains. That the representative elements in the steel industry are not permitting their judgment to be warped by the slightly better appearance of things, may be seen from the intensive competition that is in evidence for orders of attractive tonnage, specifications and delivery conditions. Concessions, it is true, have narrowed down perceptibly for the simple reason that in the case of many mills selling prices represent levels very close to production costs; but, if any buyer were to utilize the last few days of September in an effort to ascertain what he might be able to obtain sizable tonnages of steel at, say for October shipment, he would undoubtedly be able to shade conventional quotations by \$3 a ton and upwards.

**Pig Iron.**—The market's advancing tendency is gaining momentum. The misfortunes that befell the pig iron market when it crossed the \$40 level are still fresh in the trade's mind and should act as a brake on too ambitious and premature efforts to enhance values unduly.

**Steel.**—Again the United States Steel Corp. ratified by official announcement made late on Wednesday its policy of meeting all price cuts by independents, revising its "official" sheet prices downward for that purpose. Producers of cold-rolled strip steel are energetically competing with one another for what orders emanate from the automotive industries. Four cent, base Pittsburgh, appears, however, to be the lowest quotation extant, although mills are apt to do a lot of figuring before they would turn down an order for, say 300 tons, at an even lower bid price.

**Aluminum.**—Although the automotive industries are reported to be working up more metal and sheets, fresh demand has not broadened, most consumers still having considerable stocks and material due on old contracts. A London report says that Ger-

man aluminum production is now at the rate of 15,000 tons a year, compared with 800 tons before the war. The leading Norwegian producer has appointed a selling agent in the United States.

**Copper.**—A slight improvement is noted in the number of domestic buyers, but the aggregate tonnages going into this channel are still negligible.

**Lead.**—The market presents a routine appearance.

**Zinc.**—Dulness persists and the market continues feeble.

## INDUSTRIAL NOTES

**Federal Automotive Sales Co.** has been incorporated to become distributor of Penberthy products in Ohio, Michigan, Illinois and Indiana. Headquarters of the sales company will be in Detroit with other offices in Cleveland and Chicago. Officers are E. H. Janes, president; R. P. Flower, vice president, both formerly with Interstate Foundry Co., and Walter C. Voss, secretary-treasurer, formerly with Standard parts.

**Peninsular Tire & Rubber Co.,** Tampa, Fla., has announced that the company will shortly begin the construction here of a new \$200,000 plant. The building will be two stories, 100 x 300, and in addition a small office building and a storage building are also to be constructed. The initial capacity of the plant will be about 300 tires daily. The company was recently incorporated at Tampa with \$1,000,000 capital.

**Mason Tire & Rubber Co.,** of Kent, O., will purchase in the near future the cotton mills of the Quitman Mfg. Co., at Quitman, Ga., to be operated as a unit of the tire plant for the manufacture of the various fabrics made from cotton that are used in the making of tires. The Ohio company has been investigating a number of southern cotton mills recently with a view to purchasing a plant.

**Viking Motors Corp.,** Detroit, has been organized with a capital stock of \$100,000 to make airplanes and airplane engines and establish transportation routes. Officers are R. L. Bailey acting president; Fred H. Aldrich, secretary, and R. L. Bailey, treasurer. D. E. Briggs is to be general manager and E. B. Carns, aeronautical engineer.

**Columbia Body Corp.,** Detroit, has acquired the American Chemical Co.'s plant and is moving. The company has been given permission to sell \$200,000 in stock.

**International Harvester Co.** of Canada, Ltd., Chatham, Ont., is equipping its wagon and sleigh plant to manufacture International motor trucks.

## PORTAGE TO GET FIRM BACK

**PORTAGE, WIS., July 20**—The Six Wheel Truck Co., Fox Lake, Wis., which has been manufacturing a new type of truck with dual sets of rear wheels for some time on a limited scale, has accepted the offer of business men of Portage, Wis., to relocate in that city. Portage capital is taking a large financial interest and will provide quarters for a machine shop and assembling floor. Portage is a leading railroad center in the interior of Wisconsin. The Six Wheel truck was designed by F. N. Pettegrew of Fox Lake, who will be vice-president and general manager of the concern in its new location. The truck is designed especially for heavy duty hauling.

Stevens-Duryea Cuts  
Prices of 4 ModelsFive Hundred Men Put to Work  
in Plant at Springfield, Mass.

## —Other Price Cuts

**SPRINGFIELD, MASS., Aug. 22**—Stevens-Duryea has cut the price of its seven passenger touring car to \$6,800; its vestibule limousine to \$8,600; four passenger touring to \$6,900 and chassis to \$5,600, effective Sept. 1. Five hundred men are at work at the plant.

## CUT HARVEY TRUCKS

**HARVEY, ILL., Aug. 19**—Harvey Motor Truck Co. has cut the prices on its 3½-ton truck to \$3,950 and its 5-ton truck to \$4,500.

## PIEDMONT CUTS TRUCKS

**LYNCHBURG, W. VA., Aug. 23**—The Piedmont Motor Car Co. has decided to reduce the price of its 4-30 model from \$1,270 to \$970 and of its 6-40 model from \$1,495 to \$1,285.

Lehigh Rubber Opens  
Manufacture of Tires

**NEW CASTLE, PA., Aug. 22**—The Lehigh Rubber Co., backed by Frank Seiberling, former Goodyear head, has now begun the manufacture of tires. H. W. Smith, the general manager, says 100 men are already employed and that the company intends building up production to 1000 tubes and 500 casings daily.

The capacity of the plant, with full force, is 2000 casings and 3000 tubes.

## LATEST MODELS AT FAIR

**PITMAN, N. J., Aug. 22**—Although the twenty-eighth annual fair and picnic of Gloucester County granges opened in the rain, the attendance was good, and "machinery row" was thronged with a rain-coated delegation. Latest models in several makes of farm tractors, motor trucks and automobiles were the center of attraction.

Automotive men present were optimistic as to outlook for future business and were pleased with the interest taken in the exhibits of the tractors, motor trucks and passenger cars.

## W. U. TAKES INSURANCE

**CHICAGO, Aug. 22**—Effective Sept. 1, the Western Union will assume full jurisdiction over automobile insurance in its territory. This action was taken as a result of the special meeting of the union Dec. 9, 1920. Jurisdiction will be assumed over rules, commissions and regulations connected with the business. The Western merit schedules will be mandatory upon automobile business after Sept. 1.

## MEN OF THE INDUSTRY

**Wainwright Engineering Corp.**, Connerville, Ind., has announced more changes. Walter Duda, formerly sales manager of the Faeth Co., Kansas City, Mo., has been made sales manager; Joseph F. O'Brien, formerly with the Gibson Co., Indianapolis, is now chief of the order department; John D. Carmody has been made district manager of the Pacific Coast territory, with headquarters in San Francisco. For eight years he was district manager for the Champion Spark Plug Co.

**Frank Johnson**, a member of the engineering staff of Cadillac Motor Car Co. from 1901 to 1917, has rejoined his former company, after having served as chief engineer of Lincoln Motor Co. from 1917 to 1920. From 1901 to 1906 Johnson was chief draftsman and designer for Cadillac, and from 1906 to 1917 was designer on all chassis and engine parts. He designed every engine used by Cadillac to the introduction of the eight, and was a part designer of that.

**Klaxon Co.** of Newark, N. J., has placed C. E. Vaughn, assistant sales manager, in charge of the middle and northwestern territories. Vaughn goes into this new field with a thorough knowledge of Klaxon methods gained both on the road and in the office of the plant. He will open offices in Chicago.

**Charles M. Steele**, formerly of the Carl M. Greene Advertising Agency of Detroit, will be the new advertising manager of the Studebaker Corp., with headquarters in South Bend. He was at one time advertising manager of the Saxon Motor Co.

**L. F. Kedzie**, purchasing manager of the Mercer Motors Co., Trenton, N. J., has resigned, due to a reorganization of the Mercer company. Kedzie was formerly assistant purchasing manager of the Packard Motor Car Co. of Detroit.

**Clarence T. Warner**, general manager of the Michigan State Investment Co., Benton Harbor, has resigned to become president of the Warner Auto Equipment Co., which will manufacture a shock absorber with factories in Benton Harbor.

**Roy Hood** has resigned as purchasing agent for Everitt Bros. to become director of purchases for Rickenbacker Motor Car Co., Detroit, of which he will also be a director.

**Victor Bresler** of Detroit has been selected by Lexington Motor Co. to study business conditions and the export market for cars in India, Egypt, South Sea Islands, China and Europe.

**Howard A. Coffin**, formerly secretary of the Detroit Pressed Steel Co. and manager of the Disteel Wheel Division, will become the vice-president of the White Star Refining Co. Sept. 1.

**Glenn B. Hiller**, general sales manager of the American Motor Truck Co., Newark, Ohio, has resigned to take effect Sept. 1. Mr. Hiller has not announced his future plans.

**W. W. Helte**, Detroit branch manager of International Motor Truck Corp., has been transferred to the New York office.

**Harland M. Wirth** has resigned as director of purchases of the Kelsey Wheel Co., Detroit.

## FINANCIAL NOTES

**Wood Rubber Co.** has declared regular quarterly dividend of 1½ per cent on pre-

ferred stock, payable Sept. 1 to stock of record Aug. 2.

**White Motor Co.**, Cleveland, has declared the regular quarterly dividend of \$1, payable Sept. 30 to stock of record Sept. 15.

Find Industrial Field  
Tractors' Best Market

**ATLANTA, GA., Aug. 20**—While a few tractors are being sold for agricultural use in the Southeast this summer, managers for the manufacturers in this district, most of whom have their southern branches in Atlanta, agree that the primary market for the past few months has been in the industrial field, principally for use in factory yards and in road construction.

The lumber industry, ordinarily an excellent market for tractor sales in this section, has experienced such a long period of depression that but few sales are being made to this industry or have been made for some months. A large number of the mills in the Southeast have remained closed for a long time, and, while lumber conditions are gradually improving, there is little chance of this market assuming proportions to make sales effort worth while before the latter part of the year and possibly not before next year.

The revival of activity among the industrial plants of the section is having a favorable effect on tractor sales, and many plants are purchasing them for use in the yards and about the factories. A considerable amount of road construction is going on in the Southeast, and tractor sales in this field have been very good for several months.

The consensus of opinion among the local branch managers is that there will be little demand in agricultural lines until cotton reaches a much higher figure than the present market offers, which will probably be toward the latter part of the year.

Motor Excise Taxes  
Fall Off \$23,377,031

**WASHINGTON, Aug. 24**—Excise taxes assessed on automobiles for the fiscal year of 1921 fell off by \$23,377,031.63, according to preliminary statistics issued by the Treasury Department. The total yield for the past fiscal year of excise taxes on automotive equipment amounted to \$115,545,760.38. The effect of excise taxes in general was illustrated in the fact that the yield declined approximately \$36,000,000 since 1920.

Noma Motor Reduces  
Prices of All Models

**NEW YORK, Aug. 25**—Noma Motor Corp. announces price cuts as follows:

	Old Price	New Price
2 passenger .....	\$3,000	\$2,800
4 passenger .....	3,200	2,850
6 passenger .....	3,500	3,200
Sedan .....	4,350	3,700

No changes have been made in specifications.

## BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

**NEW YORK, Aug. 24**—The publication of the latest index numbers of prices indicates that some degree of price stabilization has been reached. According to Bradstreet's index, wholesale prices rose 3.07 per cent during July, as compared with a rise of 1.05 per cent during June. The rise in June was the first since May, 1920, and the continuation during July strengthens the belief that there is a tendency toward stabilization. This is borne out by Dun's index number, which rose 2.41 per cent during July, the first increase made since May of last year. The Bureau of Labor's index number showed no change. The advance for the month was caused in the main by higher prices for foodstuffs and, to a less degree, by higher prices for textiles. Metals show a distinct decline. What price changes have occurred have been of a character to level out the unevenness of prices and indicate a drift toward stabilization.

The figures presented by Secretary Davis to the Senate regarding the state of unemployment in the country indicate that workers are not yet, as a whole, returning to the factories and mills. His figures, which are merely estimates, show that there are 5,735,000 persons without work in the United States, of which a great majority are employees in the manufacturing and mechanical industries. These latter, including the building trades, have, according to Secretary Davis, 3,900,000 employees now out of work, while the number of transportation workers similarly unemployed amounts to 800,000; trade and clerical workers, 450,000; miners, 250,000, and domestic and personal service employees, 335,000. The greater number of unemployed includes women, girls and boys, who since March of last year, when we were at the peak of industrial activity, have returned to non-profitable employment at home or to school.

Due largely to the continued accession of gold, the Federal Reserve system shows further improvement. The ratio of total reserves to deposit and Federal Reserve note liabilities, combined, of the whole system increased last week from 65 per cent to 65.8 per cent, the highest in more than three years. Gold reserves increased \$24,394,000, while total bills on hand declined \$17,610,000, largely due to fewer discounted commercial bills, and total earning assets decreased \$32,073,000. Federal Reserve notes in circulation declined \$17,142,000. The improvement in the position of the New York Federal Reserve bank was even more marked, the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, was at 108.7 per cent, the highest in the history of the bank.

While seasonable demands for crop-moving funds have been increasing recently, there was last week an easier tone in the money market.

## Calendar

## SHOWS

- Sept. 5-10—Indianapolis, Automobile and Accessory Show in conjunction with Indiana State Fair conducted by Indianapolis Automobile Trade Association, John B. Orman, Mgr.
- Sept. 28-Oct. 8—New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.
- Nov. 14-19—Jersey City, Second Annual Automobile Show of Hudson County Automobile Trade Association, Fourth Regiment Armory.
- Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.
- January—Chicago, Automobile Salon, Hotel Drake.
- Jan. 7-13—New York, National Automobile Show, Madison Square Garden, Auspices of N.A.C.C.
- Jan. 28-Feb. 2—Chicago, National Automobile Show.

- Coliseum, Auspices of N.A.C.C.
- Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.
- Sept. 9 to 17—Ottawa, Ont., Can.—Ottawa Motor Show.
- Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

- September—Buenos Aires, Argentina, Passenger Cars and Equipment, La Pabellon de las Rosas, Automovil Club Argentino.
- September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm, Lighting Plants and Power Farming Machinery, Palermo Park; Sociedad Rural Argentina.
- September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.

- Sept. 5, 1921—Constantinople, Traction trials under the direction of the Turkish Ministry of Agriculture.
- Sept. 23-Oct. 2—Berlin, German National Automobile Show, Auspices of German Automobile Mfg. Ass'n and German Automobile Club.
- Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.
- Nov. 4-12—London, British Motor Show, Society Motor Mfrs. and Traders.
- November 7-14—Paris, Seventh International Exposition of Aerial Locomotion in the Grand Palais of the Champs Elysees, Held by the Chambre Syndicale des Industries Aeronautiques.
- March, 1922—Santiago, Chili, Annual Automobile Show.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.

- Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

- Sept. 14-15-16—Detroit, Credit Convention Motor and Accessory Manufacturers Association.
- Oct. 12-14—Chicago, Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.
- Nov. 22—New York, Convention of Factory Service Managers, National Automobile Chamber of Commerce.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

## RACES

- Labor Day—Uniontown, Pa., Autumn Classic.

Bosch Magneto to Go  
into Lighting Field

SPRINGFIELD, MASS., Aug. 24—Reports for some time current that the American Bosch Magneto Co. of this city has closed a deal for production of automobile lighting and starting systems that will make this corporation the largest manufacturers of these lines in the world has been confirmed by President Arthur T. Murray at his office here. However, he said that he is unprepared to give out details.

In reply to a question as to whether the contract will mean a longer working schedule at the local plant, he replied that he does not believe that it will. He explained that, according to present outlook, the larger part of the contract will be handled at the corporation's Cambridge, Mass., plant. An unconfirmed report from Boston is to the effect that the contract in question involves about \$3,500,000 and is from the manufacturers of the Hudson and Essex automobiles.

Bus Companies of Ohio  
Take New Law as Joke

TOLEDO, Aug. 20—The Graham law in Ohio which has put the motor buses operating in inter-city business under the Public Utilities Commission seems to be treated as a joke by many of the operators.

On the day which it became effective—last Monday—only six of approximately 500 buses had filed tariffs and of these only two were correctly drawn.

None of the northwestern Ohio bus lines have filed the required data with the commission.

The commission has drafted rules which require the bus lines to post schedules, rates of fare, maintain equipment, keep adequate supplies, travel fixed routes, maintain certain safety speeds at dangerous points, and pick up all passengers to certain limits who offer to ride except those "drunken or diseased."

Whenever a fare change is contemplated 30 days' notice must be given the commission. Trailers are only permitted upon the special authority of the commission.

The penalty which the commission will seek soon to impose upon delinquents amounts to \$1,000 a day for negligence in filing any required data.

Annual reports of operations and revenues must be made and special reports on accidents and interruptions to service.

Financial Statements  
Show British Losses

LONDON, Aug. 5 (By Mail)—It has been the fashion since the war for British automobile, as well as other industrial companies, to hold back their reports and to issue them for periods of eleven and up to eighteen months. The fault or cause is mostly due to circumstances beyond the companies' control, mostly due to delay in getting accounts passed by Government for excess profits tax, and in some cases it is because of delay in getting accounts through for work on Government account.

Thus the new Wolseley Motors trading report is only down to Sept. 30 last. The trading profit was £44,951 (nominally \$224,755) in comparison with £224,620 (nominally \$1,123,100) for 1918-1919, but by reason of increased first charges on first mortgage debentures issued in 1919, the profit is converted into a net loss of £83,581 (nominally \$417,905).

This bad result reflects and, indeed, is directly accounted by the ill effect of the moulders' fifteen weeks' strike, and its loss value to the company in turnover is estimated to be \$5,000,000. The balance sheet shows a bank overdraft of £315,961 (nominally \$1,579,805), while cash at bankers and in hand amounts to £6,701 (nominally \$33,505).

This report also is pessimistic as to the future of British trade abroad.

The G. W. K. Co., makers of a light friction disc drive car, report a loss of £197,497 (nominally \$987,485) on a 16 months' report up to Dec. 31 last.

Stockholders Ready  
to Back Texas Motor

DALLAS, TEX., Aug. 24—The outstanding obligations of the Texas Motor Car Association, organized for the purpose of manufacturing cars, with headquarters at Fort Worth, will be paid by an assessment of 25 per cent on stockholders, it is announced. The assessment will bring in approximately \$600,000. The outstanding obligations of the company total \$500,000, the receivers stated. The assessment will leave the receivers with \$100,000 to operate with.

The assessment committee is composed of stockholders from many of the larger cities of four States and its personnel and scope of work have the approval of the court. The receivers declared the assessment of 25 per cent will give the 17,000 stockholders in Texas, Oklahoma, Louisiana, Arkansas and New Mexico a chance to get their money back.

It is hoped to have the plant of the company in operation soon. It is believed with the outstanding obligations out of the way and a small amount of capital to work on the business of the company will soon be in operation.

## EUGOL IN CHICAGO

CHICAGO, Aug. 22—The Eugol Motor Truck Co., formed by Eugene Goldman, formerly connected with Master Trucks, Inc., has established offices in this city and has a factory in Kenosha, Wis., for the manufacture of a speed truck which will be assembled largely of standard units. Production is already under way and the factory is being enlarged for body storage and painting.

## BRAZIL CONDITIONS POOR

WASHINGTON, Aug. 20—According to reports from Sao Paulo, Brazil, conditions in the automobile market of that city are even worse than in Rio de Janeiro. Large consignments of cars are held by the banks by reason of the refusal of the consignees to meet the drafts covering their shipments.

### Twelve of the Twenty-two Manufacturers of "Fours" Who Do Not Make Their Own Motors Use the LYCOMING Model "K" Motor

Back of every successful product is an organization that has built success into its product and backed it up by a service of workmanship, performance and deliveries.

These are undoubtedly some of the reasons that so large a proportion of car manufacturers in this field are using Lycoming Motors.

But, in addition, the Lycoming Motor, with a dozen years of development, fits into the present market as if it had been especially designed for it.

Write for specifications and other information about the Lycoming Motors.

## Public Desires as Related to Design

Last week we discussed the merchandising value of the recent N.A.C.C. attempt to learn what the public wants in an automobile. Here is an engineer's estimate of the survey from the standpoint of design.

By P. M. Heldt

**T**HE relation of the sales manager to the public is definite and obvious. The interest of the engineer in the desires and current opinions of the public, however, is somewhat less direct. In the long run, however, the car which he designs must give satisfaction to the public, so that he can well afford to examine carefully the results of a survey intended to find out what the public wants in an automobile.

The engineer, naturally, approaches the recent N. A. C. C. survey from a different angle than does the sales manager. His reactions to the compiled results are different and the results bear a special significance to the design phases of automotive manufacture. Certain interesting thoughts stand out, however, when the survey is viewed from this angle.

In the first place, it would seem that the questions—which were evidently drawn up with a view to furnishing a guide for advertising managers—were capable of misinterpretation. Take, for instance, the matter of price. Last year nearly one-half of all purchasers bought the cheapest car on the market, which would seem to warrant the conclusion that price is a preponderant consideration in the selection of a car. In fact, it will hardly be disputed that the first

thing almost any prospective purchaser decides upon is the approximate price level at which he wants to buy. This price level may be determined by his financial limitations, and in the case of purchasers of low-priced cars it usually is. Even in the opposite sense price is quite an important item. You will find very few millionaires riding around in \$1,000 cars; these cars simply don't correspond to their station in life, and so they won't consider them, though in talking about the matter they might not express it in exactly that way. Therefore, when the automobile owners in their replies state that price was given fourth or seventh consideration, they probably mean slight differences in price.

What lingers in the average purchaser's mind as the thing that influenced him most is undoubtedly the thing that finally decided him to prefer the car he actually bought, over one or two others very similar to it in other important respects. That is, most of the variables had already been eliminated when the final choice was made.

From all indications buyers attach the most importance to endurance—by which is probably meant durability. But how can the purchaser judge durability? How could even an expert judge durability? True

it does not require a high degree of intelligence to predict that almost any car in the \$3,000 class will last longer than a car in the \$500 class, but this problem does not arise, for, as stated in the foregoing, the purchaser first of all determines the approximate price level at which he wants to purchase, and any comparisons on features other than price would be limited to cars within a comparatively narrow price range.

Durability depends upon a large number of factors, and there is no definite limit to the life of a car. As the car advances in age the expense for repairs and replacement of parts constantly increases, and eventually it becomes excessive, at which time the car should logically be retired. On the other hand, the annual depreciation can be reduced by keeping the car in service for a longer period. The most logical time for retiring the car would seem to be when the repair and replacement expense begins to increase faster than the depreciation expense would be decreased if the car were continued in service longer. This would be true if the service of a car were equally valuable at all periods of its life.

Anybody derives much more satisfaction, however, from a ride in a car that has been out of the dealer's store room for a week than from a ride in one that is going to be scrapped soon.

Nor is the difference wholly of a psychological nature. During the last year of a car's life it has to undergo repairs or has to be tinkered with much more frequently, and therefore is available for service a smaller proportion of the time. Further, the car is no longer as reliable as in its younger years, and the owner can no longer start on a trip with the same assurance of reaching his destination and getting back without trouble as he could when the car was newer. It is for these reasons that cars are usually retired long before the repair and replacement costs have become excessive.

Generally speaking, the things which make for durability in automobile construction, such as liberal bearing surfaces, hardened and ground parts, high grade materials and close tolerances, occasion a good deal of expense to the manufacturer, and it is well understood that they can be expected in a full measure only in the more expensive cars.

The principles of construction employed in any narrow price class are usually so much alike and the durability of the car as a whole depends upon so many separate features that it would be entirely impossible to tell which of two nearly equally priced cars on the salesroom floor would last the longest. Freedom from trouble and satisfactory service, which are generally associated with long life, are brought out in the hands of users, however, and a car that thus shows up well will in the course of time establish a reputation for itself that will be a great help toward future sales.

Engineers should be and actually are constantly on the lookout for any changes in design which would add to the durability of the car without adding materially to the cost. If cost was no object it would be an easy matter to improve any cars of the lower priced class, but, as pointed out at the beginning, price is nearly always an important factor.

In fact, most of the engineering developments of the

future in connection with passenger-car design will be with economic ends in view. While we have no doubt that salesmen and publicity writers will continue to tell of the wonderful advances in beauty of lines, in riding comfort and in luxuriousness of appointment—all of which are more or less intangible things—it seems to the writer that the present day high grade car leaves little to be desired from the standpoints of appearance, speed, acceleration, quietness, comfort, durability and dependability. Unfortunately, this type of car is within reach of only a narrow class of purchasers.

Any changes in design which can be made to reduce either the cost of construction or of maintenance will widen the market for the car. An increased market is in itself a great advantage, for it permits of increased scale of production and consequent lower manufacturing costs.

By economy in the questionnaire is undoubtedly meant low running cost (fuel and tires). About the only way the purchaser can form an estimate of these factors is on the basis of the weight of the car. There will, of course, be differences in this respect even between cars of about the same weight and within the same price class, but these are generally so small that there is no means of determining them with any degree

of accuracy, and, moreover, such slight differences would have little weight with the purchaser. Fuel consumption and tire consumption are almost entirely independent of the quality construction of the car, except in so far as this affects the weight of the machine. Therefore, to aim at economy in running cost is to aim at light weight, and this is what most designers have been doing persistently in recent years.

The results achieved in this direction have been somewhat obscured by the demand for additional equipment.

Appearance probably has more to do with the sale of cars than is generally believed to be the case. It is not meant to convey the idea that the thing which influences the purchaser above all others is appearance, but that, having narrowed the choice down to two or three makes which are satisfactory from the viewpoints of price, size or weight, seating capacity, etc., the final selection among these several cars is made on the basis of their appeal to the purchaser's aesthetic sense. Therefore, the car with an attractive body design has a distinct advantage over competitors. This is fully realized by manufacturers. In fact, appearance is bound to become a constantly stronger factor in determining car sales, as mechanical features are becoming more and more standardized and the service value in competing makes is becoming more equalized.

Service—by which is meant the facilities of the maker to provide repair parts and make repairs promptly—undoubtedly has a considerable influence on resales, while the engineer has nothing directly to do with the establishment of service stations nor with the organization of their personnel and the selection of their equipment, he has an interest in service. The ease with which a car can be serviced depends upon the design, and the engineer is to an extent responsible for the maintenance cost. For instance, if a certain part is very hard to get at and this part happens to be short-lived, it may cost a great deal for labor for replacing it when worn out, and if a car possesses a number of such

---

**“MOST** of the engineering developments of the future,” Mr. Heldt says, “in connection with passenger car design will be with economic ends in view. Any changes in design which can be made to reduce either the cost of construction or maintenance will widen the market for the car.”

---

features this may prove a great obstacle to resales. The factors affecting cost of servicing a car are so involved, however, that it is practically impossible to judge this item merely from an inspection on the salesroom floor. Evidently what most of the car owners had in mind in answering this question was a convenient, well equipped and well run service station.

It is noteworthy that hill climbing and speed are both classed very low; that is, there is only a small percentage of buyers who make these factors the leading consideration in choosing a car. Almost any car of standard make now satisfies the average purchaser in these respects. Appointments count comparatively low in the scale of factors determining sales and not much attention is paid to specifications.

If any useful conclusion can be drawn from the results of the questionnaire it undoubtedly is that the great majority of purchasers today are serious-minded and are looking for real service from their cars. Above all they want their cars to last. They want them to be fairly economical to operate and they want them to be comfortable and moderate in price. Less emphasis is laid on flexibility, hill climbing ability and speed, a large percentage of all buyers evidently considering the average modern car equal to all reasonable requirements in these respects. From the importance attached to endurance, which figures first in every sectional average and also in two price class averages, it would seem that a great many purchasers believe that the endurance of cars in general is not what it should be.

## Results of Argentine Tractor Trials.

THE table published herewith details the results officially announced of the Argentine tractor trials held by the Sociedad Rural Argentino (Argentine Rural Society), near Buenos Aires, in which American machines predominated. They are of interest not only because of the operations and costs shown but also because they illustrate the growing interest in tractor use throughout the export market.

The tractor makers of this country have, in but few cases, gone energetically after export business to Argentina. Many makes which have been successful throughout the United States have not been introduced there and there has been an apparent failure to build up a good volume of business to this growing and rapidly developing country. Yet there is interest in power farming methods in the Argentine, as this table will show, despite the high costs of gasoline and kerosene and the cheapness of horses and labor.

But the need is great. The Argentine is an agricultural country whose chief product is wheat. With this grain, it must compete in the markets of the world with that produced in the United States, in India, in Australia, in Canada and in the other wheat-growing territories. Consequently, there is every reason why the great fertile plains of Central Argentina should be cultivated with the efficiency and economy of the tractor and, no doubt, as manufacturers realize the breadth of this market, they will turn to it with practical and effective educational, sales and service campaigns.

The Buenos Aires trials were held on rather difficult ground for plowing. The announcement of the results says on this score, "The land plowed was hard on the high land and chalky on the low, with an abundance of grass and roots, which made the test somewhat difficult." The fuel costs were very high, considering similar costs

in the United States. By converting the cost in Argentine pesos on the normal basis of United States currency and converting from the metric liter to the gallon, we find that the gasoline price was 63½ cents and kerosene 47½ cents. The tractors were required to plow a furrow 8 in. in depth.

Whatever may be the belief of the tractor manufacturers of the worth of such demonstrations in the United States, no doubt can be expressed of its efficacy in such foreign markets as those of Argentina. It is necessary to put the tractor before the

agricultural buyers and no better method has yet been worked out for its introduction. The agricultural interests of Argentina are not yet sold on the efficiency and economy of farm tractors; in fact, it is doubtful if the feeling is widespread that the tractor will plow at all.

The energy with which the American manufacturers prove their contentions will determine the volume of sales there. The motorization of the Argentine ranch and farm has started, but little more than a start has been made. Hard work and plenty of educational effort is yet necessary to put over the tractor idea.

TRACTOR TRIAL SOCIEDAD RURAL ARGENTINA—BUENOS AIRES

Make	No. Plows and Size	Area Plowed, Hect.	Fuel Used, Liters	Time	Fuel per Hectare, Liters	Cost per hectare, Argentine Pesos	Cost per Hectare, Dollars	Cost per Acre, Dollars	Remarks

In calculating the dollar costs, the Argentine peso was considered as of its normal value \$0.42 gold U. S. The oil and fuel costs were computed as below:

Argentine Pesos per Liter	Dollar per Liter	Dollar per Gallon
Gasoline 0.40	\$0.1680	\$0.635
Kerosene 0.30	0.1260	0.476
Crude 0.26	0.1092	0.40

(One gallon equals 3.78 liters)

# Engineering Features of a Popular British Runabout

Eight h.p. air-cooled Rover is properly classed as a cycle car, but it is a well-made chassis which appeals to a large class of British users. It is designed to take the place of the motorcycle with side car, but gives greater riding comfort and the running expense is only a trifle greater.

By M. W. Bourdon

EVER since the commencement of what was known as the cyclecar boom in 1912-13 there have been efforts to popularize light air-cooled engined runabouts in England. But not until a well-known British firm, the Rover Company, Coventry, took up this type did it attain any real popularity. At the present time, there are prospects of other big firms producing two-seaters on similar lines, for while at first they scorned to touch the type, they have become convinced, much against their will, that there already exists a big demand and that there is an immense potential market for low-priced miniature four-wheelers.

The type in question is appealing to quite divergent classes of motor users and prospective users. The "economy wave" and the comparatively high prices asked for four-cylinder water-cooled light cars has resulted in people who in the past have owned much more pretentious cars seeking something still less costly, even if a two cylinder engine be a necessary corollary. Then, the men who have hitherto been users or potential users of the higher powered and high priced sidecar outfits but who have always had a desire for four wheels, greater riding comfort and protection have realized that the type exemplified by the 8 h.p. Rover give those advantages plus practically all that they require in speed and hill-climbing ability at prime and running costs very little greater than the elaborate sidecar outfit.

The Rover is unlike several of its prototypes in having a peculiar combination of characteristics. It is not only, as suggested, very little below the 8 h.p. sidecar in performance, being capable of 50 m.p.h. on the level and having a top-gear ability which is quite surprising. It forms also an excellent runabout for those staid and elderly, if somewhat impecunious, owners who desire no speed above 25 m.p.h. or so but demand smoothness of running, good suspension and roominess in a two-seater body. In other words, the little Rover appeals at one and the same time to the youthful "speed merchant" and the elderly "potterer"—as well as to other classes of users.

During this year, the output of this machine has reached and been maintained at 120-140 per week, which for a British plant is distinctly high for any type of car; in fact, it is probably in the neighbourhood of a record for one model.

While practically all British cyclecars or air-cooled runabouts have in the past had two cylinder engines, these have been and still are mostly of the V-pattern with cylinders set at 60 deg. But the 8 h.p. Rover has horizontally, opposed cylinders, a feature which, although shared by the A.B.C. and one or two others, is not accompanied as in the latter cases by overhead valves; it has L head cylinders, with a bore and stroke of 85 x 88 m.m. (3 3/8 x 3 7/16 in.; approximately 60 cu. in. capacity). Engine, clutch and three speed and reverse gearset are mounted as a unit, with the crankshaft axis longitudinally arranged.

The crankcase is an aluminum casting carrying the camshaft overhead and having a separate oil sump bolted to it below. The cylinders projecting at each side have detachable heads, each of these and the cylinder barrels being held to the crankcase by two long hinged bolts and a yoke. The valves are somewhat inclined from the horizontal and the exhaust valve in each case is foremost of the pair. Screwed-in valve caps are used with a central radiating projection, sparking plugs being screwed into top of the combustion chambers as these lie in the chassis, this arrangement being obviously adopted to prevent the overall width becoming excessive; but even as it is the hood is fitted with an air scoop at each side and the cylinder heads project to an extent enabling them to be subjected directly to the air draught caused by the movement of the car—for no fan is fitted, the passage of the car through the air being entirely depended upon for cooling.

The two-throw crankshaft runs on ball bearings, a single row at the front and a double row bearing of the radial type at the back. A train of three straight-toothed gears drives the camshaft, a forward extension of which has a flexible coupling for the magneto drive. The intermediate timing wheel bears a worm gear through which is driven a circulating oil pump. The big-ends of the connecting rods have double-row straight roller bearings, the rollers running on the crank pins and within an outer race prevented from moving endwise by washers rivetted to the big-end, these washers also serving to locate the rollers, which, incidentally, are not caged. The wrist pin is locked by a pinch bolt in the small end of the connecting rod and oscillates in the bosses of the cast-iron two-ringed pistons.

Front view 8-h.p. air-cooled Rover

Plan view of 8 hp. Rover chassis

Although a bolted-on cylindrical oil reservoir or tank is used, the lubrication system is not of the dry sump type, for a constant level of oil is maintained in the crankcase, only the overflow from this running back into the tank through a filter. The oil pump already referred to is of the sliding vane rotary type. It lifts the oil from the tank to sight drip feeds. From the drip feed exterior pipes convey the oil to the left-hand cylinder and to the timing gear case. The greater part of the oil passes to the latter point and maintains the level in the crankcase, whence splash occurs to the right-hand cylinder, and to a certain extent to that on the left; the latter, however, without a separate feed is liable to be insufficiently lubricated, hence the special lead already mentioned.

A subsidiary oil pipe also runs to the clutch pit to lubricate the ball-thrust collar and pilot bearing, though there is no direct communication between the crankcase and the clutch pit, and except for the subsidiary pipe the oiling systems of clutch and gearset are distinct from that of the engine.

As the illustrations indicate the carbureter is mounted centrally above the crankcase, whence two somewhat lengthy pipes lead to the valve ports. The exhaust leads follow the curvature of the inlet branches and the four are united adjacent to the carbureter flange in order to assist vaporization, the exhaust gases passing back from this point through a single pipe to the muffler.

The clutch is of the single plate type with fabric friction surfaces. Spring pressure is direct from four adjustable springs. There is nothing unusual in the construction of the three-speed gearset, which has ball-bearings throughout, two single-row bearings carrying the rear end of the main shaft. The gear-shift lever is central, and by reason of the forward position of the box the lever is bent back almost to a right angle, where it leaves its spherical bearing. Thus gear shifting consists of movements of the hand which are almost vertical instead of longitudinal, while in "crossing the gate" the lever is moved horizontally in a lateral direction; but no difficulty in driving occurs for this reason once the difference has been appreciated by the driver.

The engine and gearset unit is carried upon two slightly dipped cross members of the straight-sided frame. There are four cross members in all, two carry the power plant, one is below the dummy radiator and the other at the spring anchorage near the rear. The frame is quite a simple structure. It carries extension brackets fore and aft for the four quarter-elliptic springs.

The open propeller shaft has a fabric disk joint at the front end and a sliding pot joint at the rear, the casing of this joint being mounted on the worm shaft of the under-worm final drive.

The back axle has two steel castings for its center,

with tubular extension sleeves and a truss rod below. At their rear ends the quarter elliptic springs are bolted up to bearing sleeves on the axle casing, for the springs do not take torque. A pressed steel torque member is bolted above and below to the axle casing and suspended at the front end from the rearmost cross member of the frame. Both sets of brakes are located within the rear wheel drums, but only one pair of shoes is provided in each drum. The pedal operates one segment on each side and the lever the other two segments. Detachable disk wheels with 28 x 3 in. tires are standard.

The front axle is an H-section drop forging with vertical steering pivots. The pins are secured in the axle ends with phosphor bronze bushes about which the forked end of the swivel axles move. The front wheels are carried on adjustable cup-and-cone ball bearings. The steering gear is of the rack and pinion type, which the writer has found from experience is quite satisfactory. The peculiar steering wheel, built up entirely of steel tubing with only two spokes, and as an integral unit with the column is quite serviceable for such a light car.

The electric equipment provides electric light only from a small generator and battery. Large side lamps and a tail light are fitted, the former having two filaments representing head and side lights. No starter is provided, but an air strangler has a control rod passing forward through the dummy radiator to a point close to the starting crank. The fuel tank is carried within the cowl, fuel being fed to the carbureter by gravity.

The standard equipment consists of a roomy two-seated body with a commodious toolbox behind, single panel hinged windshield and fabric top. The upholstery is in leatherette and the body as a whole, although somewhat roughly made according to British ideas, is comfortable and durable. Five wheels and tires are included in the price, which at the moment of writing is £250 (approximately \$1200). The wheelbase is 88 in., track 46 in. and the minimum road clearance 8 in.

It is particularly desirable to emphasize the fact that, apart perhaps from the bodywork, the 8 h.p. Rover is distinctly a good class, almost high-grade, production. There is nothing whatever shoddy about the mechanical features, and except maybe in respect of control rod linkage and such minor details, the 8 h.p. model is quite up to the high quality standard of the 12 h.p. four-cylinder Rover, which is undoubtedly in the first flight of its class. In respect of this matter of quality, many makers of cyclecars and light runabouts have gone wrong in the past. They have endeavored to make a low priced chassis by adopting a low standard of workmanship instead of aiming at a simplified design with higher quality.

**T**HE Metallurgical Institute of the University of Breslau states that the properties of cast iron can be materially altered by an addition of nickel up to a maximum of 1.2 per cent. The transverse strength is then increased by about 30 per cent, the compressive strength in about the same proportion, the tensile strength by about 25 per cent and the hardness by about 18 per cent. The addition is made in the form of electrolytic nickel to the molten pig iron. Amalgamation then proceeds without difficulty at only 500 deg. Cent. above the melting point of pig iron. The addition of cobalt in place of nickel has no favorable effect.

# Motor Bus Successful in Street Railway Use

An American built motor bus has proved economical and efficient for street railway service in San Salvador. The special wheel equipment is described here in detail, while the operating conditions and cost are also discussed. The car is equipped to haul a trailer if desired.

By Donald A. Hampson

**S**AN SALVADOR is the capital of that Central American republic which is the most densely populated area on this continent. A city of 70,000, it has a street railroad, or "tramway," that serves the public within and extends several miles outside, carrying thence not only suburban dwellers but large numbers of laborers at certain hours of the day. This tramway is of 147 c.m. (57.8 in.) gage and is operated by mule-drawn cars, though a change to electricity was contemplated prior to the war.

The steam roads of the country are all narrow gage. One of them connects the capital with Acajutla, on the Pacific, and to this and the other seaport towns there are good highways, the easiest to reach in this way being La Libertad.

During the early part of 1920 it was decided to try gasoline motive power on the San Salvador tramway. Accordingly, a Daimler and a Reo were purchased for trial. The latter has shown up so well for the work that from ten to twenty more of them are to be put on the line and the mules permanently retired.

The first of these Reos was the standard 1¼-ton chassis as equipped for railroads by J. Blaine Worcester of Middletown, N. Y., and having one of the Paterson Vehicle Co.'s stock 15-passenger bodies mounted upon it. Solid rubber tires were supplied with the car at the insistence of the railway company. These were used in driving the car something less than a hundred miles over the roads from La Libertad to the capital on the interior plateau. As solid tires do not interchange on demountable rims, special wheels were made up for them and mounted in the Reo hubs; these wheels will be used to bring the new cars overland when they arrive.

Some interesting points may be drawn from such an application of motor trucks, using the data on the San Salvador tramway as representing an average where animal power hauling obtains. Tramways, industrial, logging and plantation railroads present physical characteristics peculiar to themselves and to which motor car construction is particularly adapted.

The San Salvador line was originally equipped with American-made horse cars, seating 16, of 15 ft. length over all, and weighing from 3000 to 3500 lb. During the

laborers' rush hours 30 are crowded into them. Two mules draw the cars on levels, with two more hitched in front to help over the grades. The speed is never more than 8 or 10 miles an hour at best and is much less on the hills.

Being a street railway, there are numerous sharp curves, some of them having a radius of less than 8 meters (24 ft.). There are grades of varying intensity up to 6 per cent, with a few as steep as 8 per cent and extending for 100 meter stretches. The track is laid

with 20-lb. rails on wood ties that are set into concrete foundations. In the city the footway for the animals consists of the street pavement—in the suburbs, it is mostly sand.

On arrival at San Salvador the rubber-tired wheels were replaced with the original factory wheels equipped for the rails, as shown in the accompanying cut. B is the felloe band and C the regular steel rim. A steel tire A is mounted between the inclines of C and the ring D just as in demountable rubber tire practice. This construction gives a solid bearing around the circumference and a grip sufficient to drive any load. In addition a 5/8-in. pin driven inside the tire is caused to engage a hole in the rim and thus prevents creeping should

any loosening of nuts occur. The size of the wheel center, together with a tire thickness designed for ample strength and maximum wear, brings the wheel diameter to 26 in., a decrease which reduces the road speed and increases the tractive effort about 20 per cent. In this instance, the speed is still higher than the maximum desired while the tractive effort with the smaller steel wheels is so high that most of the running can be done on high gear with its resultant economies.

The gasoline car is equipped front and rear with draw heads of the link and pin type so that a trailer can be hauled if desired. The trailers are the lighter cars of the old equipment. The motor car is sufficiently powerful to handle one of these trailers on high gear on the level stretches and over grades on indirect gears, with a full load in both cars, as noted from the following:

Tractive effort with 26-in. wheels—280 lb. on high gear. Tractive effort with 26-in. wheels—1200 lb. on low

Detail of special wheel equipment used on San Salvador street railway motor driven bus

gear. Now, assuming that the resistance of the cars is 35 lb. per ton in starting and 10 lb. at 8 miles per hour, we find that a pull of 245 lb. is required in starting, 70 lb. to run at 8 miles an hour and 1190 lb. to climb the 8 per cent grades.

Compare the above with animal haulage. A single horse car loaded as before has a weight of 3 tons, requiring a pull of 105 lb. to start it and 510 lb. to get it over the steepest grades. The average "draw bar pull" of a mule throughout a day's work is 90 to 100 lb., say the latter. It will thus be seen that the four mules will be fully loaded to get one car over the grades at a walk, whereas the motor car takes two cars at 10 miles an hour. Animals possess almost no "speed range," while the motor car, except on hills, can make any speed within reason and safety that may be desired or required.

Another factor resulting in decreased wear and tear is the motor car's flexibility in rounding curves. The horse car with two solid axles must skid half its weight on the rails throughout the length of the curve. For the 8-meter curves at right angle street intersections the difference in length between the inner and the outer rails is over 4 ft! The frictional resistance of skidding the 4-wheel cars of 3-ton weight on sharp curves is found by multiplying the weight on the outer wheels by the coefficient of friction—in this case it is 750 lb. and only by greasing the rails can the mule team successfully haul the car.

The Reo chassis referred to has the usual divided rear axle and equalizing gears, while the cross member that connects the front wheel knuckles is fitted with a "steering lock" that allows the front wheels to turn about the king bolts on curves, but automatically centers them on straight track. Thus such a car can negotiate the sharpest railway curve with a resistance of a thousand pounds less than the rigid axle car—a triumph for automotive engineering.

The Reo car was first run experimentally over the various lines of the company. At the end of the runs it was turned around by running off the rails and turning on the road. A connection handy to the driver enables

him to release the steering lock and cramp the wheels for turning. A regular run through San Salvador and to a suburb having been decided upon, turntables costing about \$300 in the United States were put down at each end of the run.

Figures as to operating costs in San Salvador are not at hand, but based upon costs in this country for similar service with American labor and adding the shipping charges to the investment, the cost per mile is approximately 20 cents. This includes fuel, labor, repairs, depreciation, overhead and miscellaneous. Assuming a daily mileage of 50 for both the motor car and the mule-drawn car, the former costs \$3,650 a year for a seven-day week operation. Compare this with animal costs.

Two mules' feed, harness, shoeing, care, etc., for one year is \$730 (365 days). One driver's wages, with extra Sunday pay, is \$682. The upkeep of the street or footpath for animals amounts to \$365 per team, making a total of \$1,777 per year for animal transportation without considering at all the first cost of animals and car. Such figures cannot but have their appeal, not only to horse car lines, but to the various privately owned and operated railroads that are using animal power.

Then there are a number of other items that must be considered in making a fair comparison of animals with motor cars. There is the relief from extra teams required to help over grades, and the possibility (as noted above) of doubling the carrying capacity by a trailer. The motor car makes so much quicker time that fewer cars are required for a given tonnage of freight or a specified number of trips per hour, and this effects a material reduction in the original investment.

The relative economy increases rapidly with the length of the line. While preferable the motor car would not have as great an advantage on a half mile line as on one two miles long. It has been found impractical to haul with animals much over half a dozen miles—with the gasoline car, the limit might be placed at a hundred and return. Roads now operating by animal power must carefully weigh the advantages of the gasoline car with those of electrification.

## Progressive and Compartment Dry Kilns

**A**LL dry kilns now on the market are either progressive or compartment kilns. In the progressive type the drying conditions increase in severity from one end of the kiln to the other, the material being moved into severer conditions as it dries. In the compartment type the same temperature and humidity prevail throughout the kiln at any one time, beginning with mild conditions and increasing in severity as the material becomes dry.

The kiln-drying data and experience of the Forest Products Laboratory indicate that each type has particular advantages on certain points, as follows:

The progressive type of kiln requires less skill in the operator. It consumes less heat per pound of water evaporated from the wood, but the saving of steam possible should not be considered so important as the question of ability to perform the work required with the best results. The progressive kiln reaches its greatest heat efficiency in drying from the green state and is most useful in circumstances which permit of its being supplied continuously with green lumber of one thickness and class. It is, however, impracticable with this type of kiln to give individual attention to special loads of lumber.

The compartment type of kiln is more flexible and affords greater control over the drying conditions, per-

mitting less change in temperature, humidity and circulation in the kiln with variations in the wind and weather. It is better adapted to meet the varying requirements of different kinds of material and is most useful where exact and careful drying is required, as in the handling of refractory woods.

## New Process for Marking Tools

**A**CCORDING to *Werkstattstechnik*, the surface to be marked, after being finished, is rolled in with a grease paste (similar to printers' ink), sprinkled with asphalt powder and covered with thin paper, whereupon a steel stamp is pressed down upon it. Upon lifting the paper the layer of grease paste comes with it at the points where the steel stamp pressed down upon it. Then the remainder of the grease paste is slightly heated to render it acid-proof; the etching is done by rubbing the surface in with red, fuming nitrosulphuric acid. If the parts must not be heated, they are not sprinkled with asphalt powder, but with resin powder, and the layer becomes acid-proof by exposing it to vapors of alcohol for a short time. This process results in very fine and clear lines.

# A Car Especially Designed for Use in Australia

Will be assembled largely from American parts slightly modified to meet tropical climate and adverse road conditions. Provision for high economy in fuel as well as in water important. Much sheet aluminum used.

**T**HE conditions under which automobiles are operated in Australia are somewhat peculiar. Australia is a tropical country, and atmospheric temperatures are normally very high. This, taken in conjunction with the fact that the roads for the most part are in very poor condition and many are nothing but paths through the desert, results in unusual demands on the cooling system. We are informed that the cooling capacity of all imported cars is absolutely inadequate, and it is no uncommon experience for the whole of the cooling water to boil away in a few hours' driving. The situation is aggravated by the fact that water is very scarce in most parts of Australia. Another requirement of the Australian market is high fuel economy, because the price of gasoline is very high.

A car specially designed for these conditions is the Eco, illustrated in accompanying cuts. It was built in

Detroit and is now being driven across the Continent by its designer, G. Hamilton-Grapes, who intends to manufacture the machine in Australia. All of the chief mechanical components will be of American manufacture. The model comprises a Turmo engine, Warren clutch and transmission, Peru axles, Zenith carburetor, Philbrin ignition, Bijur starting and lighting system and a U. S. Cartridge Co. radiator core. The wheelbase is 108 in., but this will be increased to 110 in. Three types of bodies will be fitted, a sport runabout like the one shown, a regular four-passenger and a regular five-passenger body. All bodies will be made in Australia from rolled instead of pressed sheets. A peculiarity of the design is the extensive use of aluminum. The fenders, for instance, are of aluminum sheet and are rolled by the same machine as the body plates. The running boards, toe boards and instrument board are of sheet

Views of the Eco car, designed for use in Australia. Note peculiar shape of radiator case which forms a scoop to facilitate greater flow of air through the core. Insert at upper right corner shows the exhaust heated retort employed to assist in vaporizing the fuel

aluminum on wood. This combines lightness with attractive finish and immunity to corroding influences which are especially strong in the hot climate of Australia.

Various changes have been made in the standard components of the model machine. Thus the iron pistons have been replaced by aluminum pistons weighing 13½ oz. each. Each piston is provided with three piston rings at the top and one scraper ring at the bottom, each ring being ⅛ in. wide. With a view to increasing the fuel economy the compression has been made 5 to 1. The reduction on high gear is 4.25 to 1. The flywheel of the engine was cut down in weight from 60 to 40 lb.

The frame members are straight in the vertical plane but are inclined 3 deg. to the axis of the chassis. Half-elliptic springs are fitted in front and cantilever springs at the rear. Both sets of springs are eccentred, the front springs most. In order to prevent sympathetic vibration of the springs, the leaves of the left-hand front springs are made smooth while those of the right-hand front spring are left rough. At the rear the procedure is reversed, the leaves of the right-hand spring being smoothened and those of the left-hand one left rough. The rear springs, moreover, are set at an angle of 3 deg. to the axis of the car, which is expected to exert a damping action. At the front square section helical supplementary springs will be fitted, so designed that they will close up when there are three or more persons in the car.

The wheels are of the aluminum disk type, the reason for selecting this type being that they help to radiate the heat from the tires.

The radiator has a greater frontal area and greater cooling surface than stock cars of the same horse power, and in addition an air scoop is fitted in front to increase the circulation of air. The splash apron, instead of being arranged vertically as is customary, is placed at an angle to conform to the angle of the air scoop and thus further add to the air circulation.

One of the most interesting features of the car is the special vaporizing means. In this, use is made of a retort within which the temperature is maintained substantially constant by means of a thermostat. The retort

may be described as a cylindrical chamber through which the combustible gases is passed on its way to the manifold. The mixture enters the top portion of the retort through a radial inlet and leaves it through a radial outlet. In passing through the retort the mixture current is subjected to a number of sharp bends, which has a tendency to separate out any unvaporized particles, and these collect on the walls of the retort and drain to the bottom of same. The lower part of the retort is surrounded by the exhaust pipe, and the heat transmitted through its wall has the effect of boiling off all the heavy constituents of the fuel that collect at the bottom of the retort. In the upper part of the retort is located a thermostat of the dissimilar metals type which is connected to a butterfly valve in the main exhaust pipe. As the temperature of the retort increases, this valve is opened and some of the exhaust gas is allowed to escape directly without passing through the jacket of the retort. Thus the amount of heat is automatically regulated. The thermostat can be adjusted by means of the star wheel clearly seen in the illustration of the vaporizing system. An extra air inlet is also fitted, which in the model car is operated by means of a pull knob on the dash board but which in the stock car is to be interconnected with the throttle valve in such a way that it will open after the throttle has opened about halfway. Fuel feed is by gravity from a rear tank, with an additional tank in the cowl, which latter can be connected to the carburetor by means of a two-way valve located convenient to the operator, whenever an unusually steep hill makes the feed from the rear tank uncertain.

An economy test of the car was made by two engineers of the Zenith Carburetor Co. A test chassis was used weighing 2050 lb., which with 300 lb. for the two occupants made a total weight of 2350 lb. It was found that the car ran 34.9 miles per U. S. gallon. During the test the average temperature of the mixture at the entrance to the cylinders was 125 deg. Fahr. and the average temperature within the retort, 310 deg. Fahr. A fuel of 58 deg. Baumé was used, of which 90 per cent distilled over below 410 deg. Fahr. The atmospheric temperature during the test was 84 deg. Fahr.

## Alcohol Fuel Problem in Britain

THE liquid, or to be precise, the spirit-fuel problem continues clamant for some solution in Britain. The consumption of gasoline is increasing at an accelerated pace largely due to the big fillip given to jitney and other public service coach development from the recent hold up of the railroads and the high cost of rail traveling which is now averaging 75 per cent more than before the war. Last year's total oil production according to very recent figures, was 97 million tons (British), of which 64.8 per cent was American. Beyond this value the fuel requirements of the world are so large that the oil output is only 7 per cent of the existing requirements. Benzole from coke ovens is necessarily dependent largely on the consumption of coal for gas-making and for smelting or metallurgical coke. Therefore it is essential to find another fuel which will assist out of the shortage. Research into the merits and commercial possibilities of alcohol has gone on for a long time in Britain and latterly is one of the items in charge of the Fuel Research Board. So far little of concrete value has emanated concerning it; the only practical and economical evidence of the fuel being the spirit called "Natalite" from South African waste molasses. It is now found that one of the formidable restraining in-

fluences to this development is the result of a 60-cent per gallon preference tariff imposed on foreign imported alcohol, i.e. spirit from countries not within the British Dominions. Moreover, it was stated by a deputation to the Minister of Finance (the Chancellor of the Exchequer) this week that alcohol must be allowed in duty free if it is to compete with gasoline. As there can be no progress until, and unless, there is evidence of a dependable supply of alcohol and as such is not, nor seems like being forthcoming from British Dominions, the situation suggests that it is now more important to settle the economic and fiscal problem than those concerned with the chemical and mechanical aspects of power-alcohol. It is a fair instance of how Great Britain stands to suffer by departing from her free trade traditions.

A BILL now before the Spanish Chamber provides for an expenditure of 648,000,000 pesetas on roads and bridges, 493,000,000 for the repair and upkeep of main roads, 157,000,000 for local roads, 900,000,000 for hydraulic works, 60,000,000 for lighthouses, etc., 110,000,000 for agricultural establishments and machinery, and 44,000,000 pesetas in connection with the mining industry.

## What's the Best Way to Carry Spare Tires?

**B**BETTER methods of carrying tires are being introduced gradually but there is still room for much improvement in many instances as will be seen from a study of the faults and good points in the carriers illus-

trated in the accompanying cuts. There are advantages and disadvantages in nearly every type so that it is not easy to draw conclusions which will apply in all cases, but certain general observations may prove useful.

First, the carrier should be so placed that it and the spare tire or tires will be in harmony with the body lines and not offend the eye. The bracket should be substantial in appearance and in reality and not give the impression that it was "stuck on" as an afterthought.

Second, the carrier should be accessible and require as little lifting of the tire as possible. It should not have

to be held on the bracket with one hand while the fastening device is screwed up or locked with the other. These are important points especially in the case of cars driven by women.

Third, the locking device should be simple and effective, free from rattle and preferably so arranged as not to require a tool to operate, unless operated by the same

wrench used in removing the wheel from the axle or the rim from the wheel. The cylinder lock used on the Wills-St. Claire is covered by a dust and waterproof cap and is an improvement over a padlock.

Fourth, devices which bear against the shoe or the shoe cover are preferably eliminated. Sockets or depressions in which the spare is placed, and in some cases the

carrying irons, tend to chafe the casing or its cover. Depressions are apt to hold some moisture which causes deterioration. Straps collect dust and soil the hands.

Fifth, in most cases it is better to attach the support to the chassis than to the body, for such mounting is apt to be more secure and there is less danger of injury to the body frame and panel in case of a rear end collision.

# Plywood as Material for Automobile Body Construction

The qualities of plywood as material for automobile body construction have been the subject of much discussion. Certain disadvantages have been frequently pointed out. In this article, the case for plywood is presented by a man in a position to understand the situation thoroughly.

By Armin Elmendorf\*

**T**HE manufacture of plywood antedates the beginning of the automobile industry. The question is therefore sometimes asked why plywood is not more extensively used in the manufacture of automobile bodies. It was known during the development period of the motor car body, for it had been used for years in the construction of carriages and other vehicles.

There are at least three reasons why plywood failed to meet the competition of sheet steel for automobile body panelling. The first, and probably the most important reason, lay in the fact that in the early stages of the development of the automobile body plywood panels, or "veneer panels," as they are frequently called, were manufactured with the non-waterproof glues, such as hide or bone glues. Separation of the plies followed in time and with that the automobile industry lost faith in the material. Panels made with non-waterproof glues failed to withstand the weathering to which an automobile is exposed.

A second objection raised against plywood lay in the difficulty of forming it to the curvatures required in automobile body design. Styles in automobile bodies early tended toward severe compound curves. Methods in vogue at that time for the manufacture of plywood in double curvature would not permit the shaping of panels to the severe curvatures demanded.

A third, and probably less apparent reason for the success of steel in competition with plywood lay in

the enterprising manner in which manufacturers of sheet steel adapted their product to automobile requirements. They met the special problems of body construction by concerted efforts and technical service, while manufacturers of plywood knew little about the mechanical properties of their product and were not in position to give technical co-operation.

It is significant to note, however, that even though plywood carriage bodies were originally made with non-water resistant glues, when properly made and protected by thorough painting, they gave good service. The Edison Electric, shown in Figure 1, has a plywood body made of three plies, totaling 5/16-inches and glued with hide glue. The panels were manufactured by pressing them between heavy concrete cauls. Their curvatures are, however, slight. Some cars of this kind have now seen more than ten years of continuous service and show no signs of deterioration in the panelling.

## Waterproof Glue Development

The present interest in the use of plywood for automobile bodies is a result primarily of the perfection of highly water-resistant glues during the war. Airplane requirements called for plywood which would withstand considerable weathering and which could be soaked or boiled in water without separation of the plies. Glue formulas were perfected which enabled the Navy and Army airplane departments to specify plywood which would withstand a ten-day soaking test. The success with which some manufacturers met these requirements later led to the investigation of plywood for other industrial uses.

Early in the war a process for manufacturing canoes out of 3-ply plywood had been perfected by the Haskellite Manufacturing Corporation. Plywood panels which had been softened by steaming or boiling were pressed between heated dies and allowed to dry in the pressed condition. This process was adapted to the manufacture of fuselages during the war and a modification is now used for making roofs of closed passenger cars. When plywood has been steamed or soaked in boiling water and is then pressed between dies, where it is permitted to dry, it retains the molded form permanently. In the operation of molding, the fibers in various parts of the panel are upset similar to the upsetting of the wood fibers in a chair rocker or in a wood felloe of a wagon wheel. It is well known that the back or the rockers of a chair do not change their form with changing moisture content of the wood. The same is true of plywood when made in the manner described.

The perfection of waterproof glue removed the first

\*Consulting Engineer. Haskellite Manufacturing Corporation.

Fig. 1—Old Edison electric, body panels made of 3-ply plywood. Cars like this have been driven for more than ten years without deterioration of the body panels

objection to plywood for automobile bodies, and the new process for molding removed the second objection to a large extent.

### Increased Technical Knowledge

That the third objection mentioned as formerly militating against the use of plywood for automobile bodies does no longer hold to the same extent as formerly, is evidenced by the number of plywood bodies that have been built in the last two or three years. Manufacturers are beginning to understand the properties of plywood and with increased knowledge of its properties comes confidence. While the physical and mechanical properties of steel and aluminum have been known for years with considerable accuracy, the corresponding properties of plywood were not known until they were investigated during the war by the United States Forest Products Laboratory and by a few private research laboratories. As the result of the information obtained in the research laboratories of these institutions, and also as a result of the improvement in methods of manufacture, the following advantages of plywood over sheet metal are now apparent:

1. Plywood panels eliminate the forming of the body panels by the body manufacturer.—This, of course, greatly reduces the cost of equipment of a body factory. It not only eliminates considerable factory equipment, but it also reduces the amount of floor space necessary for the production of a given number of bodies. Manufacturers of plywood body panels furnish them molded to the correct curvature and size, so that they are ready to be applied to the body frame.

2. The strength of plywood per unit of weight is greater than that of sheet steel or aluminum. By dividing the average tensile strength of 3-ply gum plywood, both parallel and across the face grain, by its specific gravity, a tensile strength of 10,800 pounds per square inch per unit of weight is obtained. The same figure for rolled aluminum is 7,200, and for mild steel, 7,650. The substantial superiority in the tensile strength per unit of weight of 3-ply plywood is apparent from these figures.

3. The plywood body weighs less than the steel or aluminum body. Two thicknesses of plywood are used in body construction—the  $\frac{1}{4}$ -inch 3-ply stock being for light bodies, and the  $\frac{5}{16}$ -inch stock for medium weight bodies. Corresponding to these we have No. 22 and No. 20 steel; and No. 16 and No. 14 aluminum, respectively. The following table shows the decided saving in weight effected by the plywood body:

#### Weight per square foot

Light weight bodies, 22 ga. steel 1.27 lbs., 16 ga. alum. 0.87 lbs.,  $\frac{1}{4}$ -inch Haskellite (Plywood) 0.73 lbs.  
Medium weight bodies, 20 ga. steel 1.50 lbs., 14 ga. alum. 1.09 lbs.,  $\frac{5}{16}$ -inch Haskellite (Plywood) 0.89 lbs.

4. Plywood reduces the weight of the body frame. While sheet steel or aluminum function only as a covering, plywood serves both as a covering and as part of the body structure. Metal panels are, as it were, merely a dress and contribute very little to the body strength, while plywood panels contribute materially to the strength. The principal stresses to which an automobile body is subjected while in motion result from the twisting or racking of the car. A simple analogy will make clear the superiority of plywood in contributing to the rigidity of the body. It is only necessary to compare two open boxes, one made of plywood and the other of sheet steel of the same weight. It will be assumed that satisfactory corner members are used in each case to give good strength in the corners. By twisting two boxes of this kind, the one made of plywood and the other of steel, it will be seen that the

plywood box is very much more rigid than the steel box. Body designers, in fact, disregard the stiffening imparted by the sheet metal paneling. In the case of plywood, however, the contribution to the rigidity of the body is so great that the designer can take advantage of it by reducing dimensions of some members of the framing, and thereby reducing the weight of the body framing.

5. Plywood deadens sound. By striking two sheet metal panels freely supported, one of steel and the other of aluminum, it will be seen that the steel panel gives out a harsher and more ringing sound. The difference that exists between sheet steel and sheet aluminum in respect to sound exists in a still more marked degree between aluminum and plywood. By striking a plywood panel similarly supported, it will be seen that plywood resounds with the dull sound of wood.

The metallic clang of sheet steel is particularly noticeable in an automobile when slamming a door. The absence of the metallic sound when closing a plywood automobile door is one of its most striking characteristics. The same property of deadening sound vibrations contributes in general to the dignity and quietness of the whole body. Vibrations due to rough roads are damped out.

6. Plywood has superior insulating value against winter weather. There are various ways in which the heat in the interior of a closed body coming from the engine, exhaust, heater, etc., escapes from the body. Some of it passes out due to convection through door and window crevices. The rest of it is conducted away directly through the window panes, the roof, and the body sides. Steel is a good conductor of heat, so that the heat in the interior of the car is rapidly carried through the metal to the cold air outside. Plywood, on the other hand, has pronounced value as a heat insulator. For every heat unit, which is conducted through plywood, the sheet steel of the same weight conducts about 2,000 heat units out of the body.

Fig. 2—Results of impact tests on steel, aluminum, and plywood panels, all of about the same weight and subjected to the same blow. A, aluminum; B, steel; C and D, Haskellite (plywood). The markings on the plywood panels are the figures in the wood. The steel and aluminum panels are badly dented, while the plywood panels remained flat.

Fig. 3 - Assembled frame for plywood sedan body.

Fig. 4 - Typical frame joint for plywood body.

Fig. 5 - Method of making rear body corners.

Fig. 6 - Body with  $\frac{1}{4}$  inch plywood panels attached to frame. Weight 485 pounds.

Fig. 7 - Completed plywood body covered with Fabrikoid.

Fig. 8 - Test track over which car was driven several hundred times at speeds ranging from 20 to 30 m.p.h.

7. Plywood is much stiffer than sheet metal. By pressing against the surface of a metal door, the sheet metal deflects a certain distance, depending upon the magnitude of the pressure. If the same pressure is brought to bear upon body panels made of steel, aluminum, and plywood, respectively, all of the same weight, it will be found that the plywood deflects only about one-thirteenth as far as the aluminum, and about one one-hundredth as far as the sheet steel.

8. Plywood is more resistant to blows. When a panel of any material is struck, the amount of energy it will absorb and still spring back to its original position without suffering a permanent dent, is spoken of as its elastic energy. It corresponds to the energy in a spring

absorbed upon applying a sudden pressure to the spring. Upon removing the pressure the spring returns to its original position. In the case of metal panels, as well as for plywood, there is a certain deflection which if exceeded will cause the panel to receive a permanent dent. Under such conditions the elastic energy has been exceeded. Extensive tests have been made to compare metals and plywood in this respect, and it was found that the energy which will cause a plywood panel to receive a permanent dent is usually seven or eight times as great as the blow which will seriously dent sheet steel or aluminum. This means, of course, that many blows which will dent a metal body would not cause a depression in the plywood body. The energy

which will cause actual rupture of plywood has been found at times to be fifty times as great as that which will dent a sheet steel body so badly that it has to be repaired. Fig. 2 shows the effect of blows of the same magnitude upon steel, aluminum, and Haskelite (plywood) panels of about the same weight.

9. Repairing. When a sheet metal body is badly dented by striking an obstruction, the upholstering has to be removed and the dent hammered out. The success with which the damage is concealed depends largely upon the skill of the mechanic upon the job. In the case of plywood, which will only rupture under a much more severe accident, the particular panel in which the fracture occurred is simply removed bodily from the side. It is then replaced by a new panel of the same kind and size.

10. Finishing. Users of plywood for body purposes prefer either one of two methods of finishing. The first calls for covering the body with a muslin cemented on to the wood. The muslin is subsequently primed and filled with putty glaze or "rough stuff," and is then enameled according to standard procedure. The second method consists in applying some type of artificial leather, such as Fabrikoid, to the surface. Such materials are glued on and require no further finishing. They have the advantage over the paint shop finishes in that they greatly reduce factory floor space. It is estimated that the amount of floor space necessary for finishing is reduced to one-twentieth the paint shop space and drying rooms. Such materials are particularly applicable to the plywood body because they are easily glued onto wood.

11. Cost. While aluminum is comparable to plywood in some of its properties, it costs about twice as much. A complete set of plywood panels, molded and ready to be applied to the body frame, costs about the same as a set of steel panels ready to be applied. The fact that the cost of plywood compares so favorably with that of steel will no doubt in the future contribute to its more extensive use.

One of the most successful designs of a plywood body recently developed is that worked out by the Wright-Fisher Engineering Company of Detroit, for the Birmingham Motors Corporation of Jamestown, New York.

The body frame is shown in Fig. 3. Several features are worthy of note in the construction of this frame. The reduced thickness of the sills should be noted in particular. The wheel housing is of 3-ply Haskelite made with waterproof glue. All horizontal wood members of this frame are of poplar, and the vertical members as well as the sills are of ash. The roof rail is of poplar and the bows are of ash.

The method of framing the horizontal and vertical members is shown in Fig. 4. The two members were glued and screwed together. The method of making the rear corners is shown in Fig. 5. The plywood panels were first glued by clamping to the corner posts, and after the glue had hardened the corners were rounded as shown. A joint of this type overcomes an objection sometimes urged against plywood for body purposes in that it removes the blunt end of the panel and substitutes for it a feather edge. In this way the stresses at the end of the panel set in by any racking motion of the body are very small. Experience in the construction of carriages showed that this was the best type of joint to prevent joint openings.

The body with the panels fastened on is shown in Fig. 6. The panels were glued along the edges to the frame and clamps were applied at frequent intervals, holding the plywood to the frame until the glue had set. The operation of screwing and unscrewing the clamps requires little time and compares very favorably with the time of applying metal panels to the frame.

The weight of the body, as shown in Fig. 6, is 485 pounds. This includes the hardware, fittings, cowl, etc. All body panels are  $\frac{1}{4}$ -inch 3-ply poplar Haskelite.

The body is mounted on to the chassis frame with three bolts on each side in the conventional manner.

The completed car is shown in Fig. 7. It weighs 3,000 pounds as the manufacturer delivers it, without accessories but with front and rear bumpers. The car has a wheel base of 124 in.

As evidence of the great rigidity and strength of the body to withstand the racking motion of rough roads, the test track shown in Fig. 8 was laid and the car was driven over it no less than 500 times at speeds ranging from twenty to thirty-five miles per hour. The body did not suffer even under such a very severe test.

## Casein Glues Exceptionally Durable in Damp Places

CASEIN glues are as a class more water-resistant than animal and vegetable glues, but they are not, strictly speaking, waterproof. There is no glue that is waterproof in the sense that it is absolutely unaffected by water after a long immersion. Nevertheless, there are casein glues that are so water-resistant that plywood glued with them will withstand soaking for many weeks in water or exposure for many months to a warm, damp atmosphere. Under similar conditions, animal and vegetable glues would lose their strength in a short time.

When casein glue joints are kept fairly dry, they can be expected to retain their strength and remain unchanged for an indefinite period, as is the case with animal and vegetable glues. Water-resistant casein glue in a joint, kept constantly wet, will, after a long time, weaken, but it will ordinarily regain a great deal of its strength if the joint is dried. In a study aimed to discover the reason why casein glues ultimately decompose when kept moist, the Forest Products Laboratory found that under certain conditions the decomposition seemed to be due to a hydrolysis of the casein, undoubtedly brought about by the sodium hydroxide that is always present in casein glues.

This explanation when published recently was misunderstood to some extent. It should not be taken to mean that casein glues are unreliable, and not durable enough for use in manufacturing plywood and other glued products. On the contrary, casein glues are considered as permanent as any under dry conditions, and the water-resistant casein glues are more permanent than animal or vegetable glues under wet or damp conditions.

PENCIL drawings are light grey and easily erased; for many purposes, as, for example, reproduction drawings, workshop drawings, etc., it would be desirable to convert pencil lines into dark black lines adhering firmly to the paper. According to the patented process of Doctor Gruner this can be easily accomplished by laying the drawing side of the pencil drawing on a clean zinc plate and rolling over the back side with a metal roller. The zinc plate is connected to the positive pole, and the metal roller to the negative pole of a direct-current house circuit. The current detaches some zinc from the zinc plate and this zinc is deposited in a finely spread form on the graphite of the pencil lines, adhering closely to the fibers of the paper.

# High Altitude Aircraft of the Future

The possibility of keeping engine output constant at high altitudes is discussed in this article, together with the relation of this factor to various types of flying. The writer compares the probable function of the airplane and dirigible. The article was translated from *Der Motorwagen*.

By Professor C. Eberhardt

THE output of an ordinary gasoline engine decreases with increasing altitude substantially in proportion to the density of the atmosphere. The result of this is that flying speeds decrease materially at higher altitudes. Curve  $v_x$  in Fig. 1 shows this decrease in flying speed. It will be seen that the plane on which this diagram is based has a flying speed of 93.2 m.p.h. close to the ground. With increasing altitude the speed increases at first and attains its maximum value of 94 m.p.h. at an altitude of 2500 ft. However, up to an altitude of 6000 ft. there is no appreciable speed variation. But beyond 6000 ft. the speed decreases rapidly; at the maximum altitude which the machine is able to attain, the "ceiling", it is only 75 m.p.h.

If the airplane on which this diagram is based serves for commercial purposes there is no object in seeking to attain a greater altitude than 6000 ft. The machine flies most rapidly and most economically at about 2,000 ft.

The conditions are entirely different if the output of the gasoline engine is maintained constant for changing altitude. This is now possible within certain limits, up to between 16,000 and 20,000 ft., by providing the engine with an air compressor which supplies it with the air necessary for the complete combustion of the gasoline vapor at all altitudes. At an altitude of 20,000 ft. the air pressure is equal to only about  $\frac{1}{2}$  atmosphere. In order that at this altitude the engine may draw in the same weight of air as at ground level it is necessary to precompress the air to 1 atmosphere.

This, however, does not suffice to ensure the desired result. There is also required a propeller with variable pitch, as a non-adjustable propeller is incapable of absorbing the whole output of the engine in the tenuous medium. The engine would race. Such propellers were under development in Germany toward the end of the war, by Prof. Reissner, the Lorenzen propeller firm, A. Boerner and others, but the experimental work on them was not completed.

Adjustment for a steeper pitch with increasing altitude is then accomplished either manually or automatically, through the intermediary of the declining pressure of the outer atmosphere. Under these conditions we obtain for the same machine as that previously considered, the flying speeds plotted in Curve  $V'_x$ , Fig. 1. It will be observed that there is a continual increase in speed with increasing altitude nearly up to the ceiling. With constant engine output the ceiling is exactly three times as high as that in the first case, in which the engine output decreased normally.

If it were possible to keep the engine output constant up to this altitude, the maximum flying speed at 50,000 ft. altitude would be 143 m.p.h. instead of 94 m.p.h. as in the first case.

It will be seen, however, that even within the altitude

limits within which it is possible to keep the engine output constant, about 20,000 ft., there is a material gain in speed. While, therefore, it would be useless in the first case to ascend to a higher altitude than 6,000 ft., the object now is to fly the main part of the trip as high as possible, for the speed curve  $V'_x$  shows the maximum speed to be reached at an altitude close to the ceiling, while the curve  $v_x$  shows it to be attained near ground level.

The materially reduced air resistance at high altitudes, in conjunction with the constant engine output, as well as its complete absorption by the propeller, are the causes of the considerable increase in speed. It is presumably the same mechanical reasons which induce all migratory birds in their migrations to fly at considerable altitudes. Even the comparatively low-flying curlew has been observed to fly at an altitude of 16,000 ft. But it is believed to be very likely that many migratory birds fly at the surprising heights of 30,000 to 40,000 ft.

It is to be assumed that the characteristic five pairs of air bags within the bodies of birds serve the purpose of supplying the air required by the animal engine in order to keep its output of muscular power constant at

Fig. 1—Relation between flying altitude and speed under various conditions

Fig. 2—Airplane with closed cabin in which constant air pressure is maintained at all altitudes. Fig. 3—At right, relation between altitude and speed of a dirigible

high altitudes, thus increasing the flying speed. This is undoubtedly the object of flying at such high altitudes, where the air pressure is barely one third atmosphere and the temperature as low as minus 58 deg. F.—a temperature which the migratory bird, protected by its warm feather coat, can withstand without difficulty, especially when it is considered that it is doing continuous intensive muscular work.

As regards altitude flights by airplane we would have to consider for the present altitudes of 20,000 ft., at which the air pressure is about one-half atmosphere and the temperature from minus 4 to minus 22 deg. F. An extended trip at such altitudes therefore is possible only if an airtight cabin is provided for the pilot and passengers, within which the temperature and pressure are maintained normal. Continuous replenishment of the air required for breathing is another requirement.

The technical solution of this problem is essential to the production of the altitude flying machine. According to a plan of Boerner, this problem is solved in a simple manner as follows: The air pumped by the compressors, instead of being fed directly to the engines, as has been the custom heretofore, is forced into an air-tight space at the rear of the fuselage which serves as an air reservoir. From there the air, which is compressed to about one atmosphere and considerably raised in temperature, passes through a reducing valve into the main cabin, so that the passengers are constantly supplied with fresh air at constant pressure and a temperature of about 68 deg. F. Through a second reducing valve the air then passes into the engine space and pilot's enclosure, from where it is drawn into the engine.

The accompanying drawing, Fig. 2, is a side elevation of a flying machine within the cabin of which a constant air pressure can be maintained in the manner described. The fuselage A which is intended to be made absolutely airtight, and with all moving parts extending to the outside passing through stuffing boxes, is divided by two air-tight partitions B, C, into three compartments, D, E, F. Compartment D contains the engine I and also serves as the pilot's and mechanic's compartment. Compartment E is the passenger cabin, while compartment F serves as a reservoir for the compressed air. In partition C there is a reducing valve G, in the partition B a reducing valve H. Upon the crankshaft of the engine is mounted a centrifugal air compressor J whose suction line ends in a trumpet-shaped mouth piece K outside the fuselage.

For a 2000 hp. plane there would be required from 60 to 70 cu. ft. of air per second, which would have to be supplied by the compressor. For an altitude of 16,000 to 20,000 ft., at which the air pressure is only about one-half atmosphere, assuming adiabatic compression, there will be a temperature rise of 83 deg. F., and if we assume the outside temperature to be minus 15 deg., the temperature within the fuselage will be 8 deg.

The compressor capacity for this altitude figures out to 190 to 220 hp.

From these figures it will be seen that there is nothing in the way of a practical realization of the Boerner conception. No trouble need be anticipated from the excess pressure of one half atmosphere within the fuselage, as regards rigidity, weight and airtightness of the walls. As the problem of maintaining the power output of the engines constant and that of the ability of the propellers to absorb this power at all altitudes may be regarded as solved, there are now no longer any fundamental difficulties in the way of a realization of the altitude airplane.

The importance of the high altitude airplane for the future is to be judged on the ground that it probably will be called upon to open up transatlantic routes through the air—a field which at present seems to be reserved for the dirigible, on account of its greater load capacity at equal speed. Owing to its higher flying speeds, the high altitude airplane offers the possibility of crossing the ocean with a limited yet commercially practical useful load, even though regular transatlantic air traffic will always remain the chief problem of the dirigible. On the other hand, the chief problem of the giant airplane, commercial traffic over prepared continental routes, in stages of suitable length, would be materially facilitated by the use of altitude airplanes, and the economy of the service would be greatly improved by increasing the length of the stages from 600 to 1200 miles.

It is true that a dirigible also gains by the use of engines with supercharger and adjustable pitch propellers. But with the use of ordinary engines, without supercharger, the speed remains constant at all altitudes, in contrast to the airplane, as the air resistance decreases with increasing altitude in the same measure as the engine output, and therefore as the propeller thrust.

Fig. 3 shows the variation of the speed of a dirigible with altitude up to 23,000 ft. In the case of decreasing engine output we obtain for the  $v_x$  curve a straight line parallel to the y axis, that is, a constant speed. In the case of constant engine output the increase in speed with the altitude may be seen from the curve  $v_x'$ . The speeds are given in miles per hour.

But for dirigibles the use of supercharging engines is not of nearly the same fundamental importance as for airplanes; mainly because flights at high altitudes are rendered commercially impracticable by reason of the reduced load carrying capacity. The gain due to the increased speed at altitudes is entirely out of proportion to the loss due to the reduced buoyancy and the corresponding loss in load carrying capacity. But the large load factor, which in the case of large dirigibles amounts to as much as 60 per cent, determines the superiority of

the dirigible over the airplane for certain purposes and insures to it for the present the absolute supremacy on transatlantic routes.

The development of the altitude airplane may, however, change the situation in that the dirigible will no longer be without competition on transatlantic air routes.

The chief problem of the dirigible and the giant airplane were outlined above. These will hardly be materially changed in the future. It is evident, however, that the limits of these two, physically so widely different, types of aircraft cannot be drawn with any degree of accuracy. The determining factor is always the economy of the service, which depends upon the geographical, cultural and climatic conditions of the route to be covered.

Aircraft alone of all vehicles of transport is not tied down to any road; it therefore travels, when at all possible, along the large terrestrial circle which connects the point of departure and the goal. But how important a factor the geographical conditions just referred to are, when the question of a relay flight in a giant airplane or a continuous flight in a dirigible is to be decided, will be realized when it is stated that the shortest route from New York to Peking, for instance, leads across the

North Pole, which makes it plain that at present this trip could be made by airship only.

The fundamental difference in the use of giant airplane and dirigible may be best outlined as follows: An uninterrupted trip around the earth, that is, without intermediate landings, say on the parallel of Berlin, could even today be made by a German dirigible specially built for the purpose, presumably with perfect safety, in the direction from West to East, in from 10 to 14 days. A modern giant airplane can cover this distance only in stages by circumventing the large ocean areas, and under the condition of prearranged and, therefore, expensive landing fields at distances of 600 to 900 miles. The altitude airplane of the future may be able to fly the oceans and greatly reduce the number of stages, hence compete with the dirigible over long distances—not in respect to the useful load carried but in respect to speed.

It will therefore be seen that, disregarding the small airplane on long trips, only the dirigible is in position to choose the shortest route and to cover it without stop, and that in consequence it can compete with the greater speed of the airplane, which loses time by delays at the landing places and by possible changes of machines.

## A Cushion Coupler

**A** CUSHION coupler device has been devised to absorb the first blow or shock transmitted by letting the clutch in suddenly on a rapidly revolving engine, or, on the other hand, to take up the torsional shock which comes in the other direction from the driving wheels of a car, due to quick breaking, or road irregularities. The device is so arranged that it will absorb the torque whether it is from the right or left; whether it originates at the engine or rear wheels, or from both ends at once.

The manufacturers claim that the coupler protects the differential, axles and tires from the jerks and wrenches of over-acceleration and also smooths out the irregularities in the power flow from the engine.

The drive passes from the driving member to the driven member through cam faces held in contact by a powerful helical spring. Sudden applications of power will cause the cam faces to move in relationship with each other, and compares the helical spring, which absorbs the blow.

Referring to the illustration, the torque is applied to the flange of the cam member, A, which is freely mounted on the coupler shaft, B. As A begins to rotate, the cam member, C, is forced away from the upper member, thus compressing the spring D. This action continues until the pressure of the splines on the shaft B equals the torsional force, where the drive becomes positive. The reverse action, although opposite in direction, is identical. One of the important features of the design is that the shaft B extends through the entire coupler and the distance between the flanges is constant.

The design of the cam faces permits a rotary or torsional movement of 70 deg. This means that from one to ten or twelve power impulses from the engine, depending upon the engine speed and gear reduction, occur before the drive becomes positive. In other words, it is possible for the engine to expend a portion of its energy in winding up the springs on the coupler, thus tending to prevent stalling of the engine.

The device is fitted with a tubular grease tight cover so that lubricant for the splines is always present. The coupler can be placed on the rear end of the propeller shaft, or on trucks having the gearset amidship, the

equalizer can be placed on a jack shaft between the gearset and engine as well as on the propeller shaft. In production jobs the coupler can be built in as an integral part of the propeller shaft, rear axle or gearset assembly, as desired. The device is manufactured by the Flexo-Motive Corp.

Flexo-Coupler with grease cover removed showing the construction and assembly of the cam and drive members

## Research Work on Electroplating

**D**URING the month of May a number of meetings were held by the American Electrochemical Society in the interest of research work on electrodeposition, these meetings being attended by a representative of the Bureau of Standards. Plans were made for the formation of a division of the society to be concerned wholly with this kind of work. If such a division is organized it will be a distinct advantage in bringing together persons interested in this field and thereby stimulating research work along electrochemical lines.

Letters have been sent out by the National Research Council to about 200 representative manufacturers in whose plants electroplating is an essential process. The purpose of these letters is to inquire whether they would be willing to furnish financial support toward research work on electrodeposition. If such support is received, it is expected that the funds will be expended for research work conducted at the Bureau of Standards under the general supervision of an advisory board.

# Grinding in the Automotive Industry

## Part IV—Finishing Engine, Transmission and Chassis Parts

In this, the concluding article in this series, the subject of methods used in grinding crankshafts, flat faces, camshafts, gear teeth, splines and other parts are considered and allowances for metal removal are given.

By P. M. Heldt

**T**HE crankshaft is one of the most important parts of the engine so far as grinding operations are concerned. As has repeatedly been stated, by grinding it is possible to form a truer and smoother surface than by means of cutting tools, and as the crankshaft comprises from six to thirteen bearings operating at high speed, these better bearing surfaces result in a considerable reduction in friction losses and an increase in the life of the bearings. Crankshafts are heat treated and show a considerable degree of hardness, which is one of the reasons that it is impossible to get the desired finish with lathe tools. Of course, even in the untreated state the bearings cannot be turned sufficiently smooth and must be filed and polished afterwards. This method of hand finishing is rather tedious and also is inaccurate unless a very skilled operative does the work. Therefore the draw-filing and polishing were replaced by grinding. Sometimes the rough turning is done before the shaft is heat treated, when it can be machined more readily.

### Crankpin Grinding

Grinding the main bearings presents no particular difficulty, as the shaft can be put into an ordinary cylindrical grinder. A few manufacturers use case hardened crankshafts, in which case finishing by grinding is absolutely necessary. Among the latter is the International Motor Company, manufacturers of the Mack truck. The crank is forged from open hearth steel with 0.10 to 0.20 per cent

carbon content, and after carbonizing and quenching it shows a scleroscope hardness of 80 or more. In the rough turning 0.050 in. of stock is left on the diameter, and this is removed in two grinding operations, a rough and a finish grind. The roughing operation removes 0.035 in. of this and the finishing operation the rest. Practice as to the amount of material or stock allowed for the grinding operations varies considerably. Thus another manufacturer having an engine of substantially the same size as that just referred to removes 0.045 in. of stock from the front and rear bearings and 0.060 in. of stock from the center bearing in the rough grinding operation and from 0.005 to 0.008 in. on all bearings in the finishing operation.

### Standard Fillets

In the grinding of both main bearings and crankpins, wheels of large diameter must be used, so that the wheel clamping collets will not interfere with the adjacent crank arms. It is customary to use the wheels for other classes of work after they have worn down to a diameter such that they can no longer be used for crank main journal and crankpin grinding. All crank journals must be provided with fillets, and when the grinding wheels are trued up they must have their corners rounded to a corresponding diameter. Too great a variety in the sizes of fillets used has caused considerable annoyance in the past, and in consequence the S. A. E. a year ago standardized the fillet radii for crank bearings as follows: The wheels are

(Left) Grinding bottom flange of cylinder block in Blanchard grinder. (Right) Grinding ends of connecting rod head in Blanchard grinder

Grinding crank pins in Landis crankshaft grinder

to be made in nominal widths of  $1\frac{1}{2}$ ,  $1\frac{5}{8}$ ,  $1\frac{3}{4}$ , 2,  $2\frac{1}{8}$ ,  $2\frac{1}{4}$ ,  $2\frac{3}{8}$ ,  $2\frac{1}{2}$ ,  $2\frac{3}{4}$ , 3,  $3\frac{1}{4}$ ,  $3\frac{1}{2}$ ,  $3\frac{3}{4}$  and 4 in. and the radii of the edges are to be  $\frac{3}{32}$  in. max. Grinding wheel manufacturers allow 0.029 in. extra width for truing.

As an example of production in crankshaft grinding the following may serve: In the Buda plant  $2\frac{1}{2}$  in. four cylinder crankshafts with three main bearings are put through the rough grinding operation on the main bearings at the rate of 55 per eight-hour day and through the finish-grinding operation at the rate of 58 per eight-hour day. All bearings are inspected and must be concentric to within 0.001 in. A scleroscope test is also made and must show between 41 and 45 points hardness. This, of course, is a heat-treated shaft.

### Production in Crankshaft Grinding

For grinding the crankpins the crankshaft must be placed in the grinding machine with indexing and balancing fixtures. Roughing and finishing operations are also required by the pins. In the case of the Buda crankshaft above referred to, 0.060 in. stock is removed in the roughing and 0.010 to 0.015 in. in the finishing operation. The tolerances are plus and minus 0.001 in. and the production is 60 per day of eight hours for each of the two operations.

On most automobile engine crankshafts only the journals, the flywheel flange and a possible clutch pilot are finished, the crank arms being left in the rough. In aircraft engines, however, and in general European practice the crankshafts are finished all over. Since the war some of the manufacturers of high grade cars in this country have begun to finish their crankshafts completely, and this involves additional grinding operations. Thus the Packard Motor Car Co. finishes the contour of the crank arms of its single-six model in a grinder operating on the same principle as a cam grinder. In this operation the crankshaft is revolved at the rate of 9 r.p.m., about  $\frac{1}{8}$  in. stock is removed and the contour is held to within 0.010 in. of blue print dimensions. The faces and circumferences of the thrust flanges and flywheel flange are also ground.

Poppet valves are ground both on the seat and on the stem. Special grinding machines and special fixtures for grinding the seats of such valves have recently been introduced by a number of manufacturers. The valve is held by its finished stem in a chuck and the grinding wheel, set at the proper angle, is fed up toward the seat. The stem is turned and ground between centers, but the lower center is usually cut away later.

Camshaft grinding is a branch of the grinding industry

by itself. Not only the contours of the cams but also the bearings are ground, but the first operation, of course, involves the greatest difficulties. These surfaces are case hardened and, therefore, call for a comparatively hard wheel. The usual plan is to mount the grinding wheel spindle on a slide which is actuated by a master cam four or more times the size of the cam to be ground and an exact enlargement thereof. Cam grinding machines and cam grinding attachments for universal grinders are made by the Landis Machine Co. and the Norton Co., and the Rolls-Royce Co. make a machine of this kind for their own use under their own patents. Sometimes a so-called constant acceleration cam is used, in which case the flanks of the cam are concave and small diameter grinding wheels are required. Occasionally the camshafts

carry an eccentric for the oil pump and are provided with an end thrust flange, both of which must also be ground. If the cam contours are ground with a cylindrical surface, the diameter of the grinding wheel has an influence on the form of contour produced, and wear of the wheel must therefore be allowed for.

The remaining parts of the valve gear, that is, the push rods and the rollers, therefore, are also ground. In the works of the International Motor Co. two grinding operations are performed simultaneously on the hardened cam roller. While the roller is held in a chuck the hole is ground with a  $\frac{3}{8}$  in. wheel of  $\frac{3}{8}$  in. face, which runs at 30,000 r.p.m. and removes 0.003 in. of metal. As this wheel feeds into the hole a saucer wheel running at 1800 r.p.m. comes into contact with the face of the wheel and removes from 0.002 to 0.005 in. of material. The production is 50 rollers per hour.

### Face Grinding of Housings

Until recently the joint surfaces of machinery casings were generally finished in continuous milling machines, and this is still the practice where soft materials, such as aluminum, are concerned. However, if the cases and their covers are made of relatively hard material, particularly cast steel, there is now a tendency to finish the joint surfaces by grinding. Cast steel and semi-steel casings are used to some extent in truck and tractor practice, and it is in the truck and tractor industry that equipment for surface grinding housings and covers is most frequently seen. A part in point is the cover for the camshaft gears which, if the engine has three-point suspension with one point in the form of a trunnion on the hub of this cover,

Foot stock, clutch, balance weight and indexing device on Landis crankshaft grinder

Cam grinding in Norton grinding machine  
(Note back rest)

must be made quite strong. Such covers can be ground to advantage in surface grinders with vertical wheel spindles, a special fixture being required for holding the work on the table. This fixture supports the cover under the flange which is to be finished off so it cannot spring away, thus helping to secure an oiltight joint. Similar surface grinding operations are performed on the oil pan joint, water jacket covers, bell housing and exhaust manifold.

The above will suffice to show that in the manufacture of automotive engines as carried on to-day there is hardly a part of any importance, with the exception of the fly-wheel, in the production of which one or more grinding operations are not performed. Cost of production is an important factor, and no doubt the introduction of grinding has done its share toward the reduction of manufacturing costs and thereby to make possible the enormous outlets for automotive equipment. But it can also not be denied that grinding has resulted in better work and made for a superior product.

### Gear Grinding

In passing from the engine to the transmission parts, we may skip the clutch, for although there are a number

of operations on a typical design of clutch that can be done to advantage in the grinding machine, there are very similar operations in the gerset, and we thus avoid useless repetition. In the manufacture of the gerset, grinding also plays an important part, for one reason because hardened steel parts are largely used. The gears of the gerset are either oil hardened or case hardened after they are cut, and as this tends to distort the teeth, it is a good plan to allow a slight amount of surplus stock in the cutting operation and grind the teeth after hardening. In a recent article we described the Maag method of grinding the teeth of hardened gears, in which the wear of the saucer-shaped grinding wheels is compensated for automatically by means of an electric contact device. In this country the Gear Grinding Machine Co. has developed a system of grinding gears after hardening which has met with considerable success.

There are two basic methods of gear grinding. One is based on the fact that the rack tooth of the involute system has straight side flanks; hence a gear wheel cutting with its straight side, when placed at the proper angle relative to the pitch circle at the tooth flank being ground and moved tangentially to simulate the motion of a rack tooth relative to the gear, will give the correct tooth outline. The other method consists in the use of a grinding wheel with a formed grinding surface and is very similar to the cutting of gears by means of a milling cutter. The grinding surface of the wheel is trued by means of three diamonds, the truing operation being performed without removing the wheel from the machine. One of the diamonds is traversed across the straight top of the grinding wheel which grinds the bottom of the tooth space and the other two true each one of the sides of the wheel by which the involute flanks of the teeth are ground. The level of the traversing diamond is the datum line of the machine, the grinding wheel arbor being mounted above it and the work arbor below. As the grinding wheel cutting surface wears away its center is lowered to bring its lower edge down to the datum line again. The two truing diamonds for the sides of the grinding wheel are guided by means of cams enclosed within the machine, whose outlines correspond to the form of the teeth to be cut.

It is obvious that a different pair of cams are required for each form and pitch of tooth. In making these cams, templates of aluminum of eighteen times the size of the tooth are first made; these are then mechanically reduced

Grinding top half of aluminum crankcase in Diamond surface grinder

to six times actual size and duplicates of these reduced cams are fixed in the machine.

### Stock Allowance for Grinding Gears

When gears are thus ground after case hardening, no attempt is usually made to get a very accurate tooth outline in the cutting process and stock for grinding is allowed in the cutting. At the bottom of the tooth gap about 0.010 in. of stock is allowed for grinding in the case of transmission gears, and on the tooth flanks, from 0.006 to 0.009 in. The allowance at the bottom of the tooth space is a matter of no great consequence, as this is not a working surface; on the other hand, the allowance on the flanks must be strictly limited, because otherwise the grinding wheel is apt to cut through the case of a case-hardened wheel and thus cause a soft spot in the flank.

Gears are generally ground in gangs, and in order to ensure accuracy it is necessary that the bores be ground out accurately and that the ends be ground square with the bores. These gear grinding machines are not manufactured for the market, but built by the Gear Grinding Machine Co. merely for its own use, the company contracting to grind customers gears that have previously been finished up to the grinding stage.

### Grinding of Splines

The shafts of gearsets are generally mounted in ball or roller bearings, and the seats for the bearing rings, both on the shafts and in the housing, should be ground. The primary shaft of the transmission, moreover, is provided with driving splines, and as the shaft is hardened after having the splines milled, the latter are likely to be distorted, hence the finishing operation should preferably be by grinding. This operation can readily be performed in a universal grinding machine with a wheel having its circumference dressed to the exact form of the groove between splines. Lately the Gear Grinding Machine Co. has also been grinding splined shafts on the same principle as that employed by it in grinding gears.

For a long time there was a great deal of controversy as to whether the sliding gears of the transmission should bear on top of the splines or on the bottom surface of the grooves. There was not much advantage one way or the other, because while the top surface of the splines on the

Grinding crankcase bottom half in Diamond surface grinder

shaft and the inner surface of the teeth in the gear could be finished quite accurately, it was quite difficult to accurately finish the bottom of the grooves on the shaft and the bottom of the keyways on the gear, so in either case one surface was not very accurate. Since the splines on the shaft are ground this difficulty has been overcome, and it is now the general practice to support the gears on the bottom of the spline grooves, which necessitates the grinding out of the bores of the gears. This is done in an internal grinding machine, and the most interesting feature in connection with this operation is the method of holding the gear while it is being ground. Evidently, for quiet running, the gear must turn concentrically with its pitch circle, and how to get the bore of the gear after its final grinding concentric with the pitch is the problem. There are three methods of holding the gear in the grinding machine for grinding the bore, namely, by the top of the teeth, by means of rolls contacting between the teeth at the pitch circle and by means of wedge blocks with narrow teeth entering between the gear teeth and bearing against the bottom of the tooth spaces.

### Holding Gears for Grinding Bores

Holding the gear at the top of the teeth does not give accurate results, because the pitch circle is not necessarily concentric with the outside circle, having been formed or determined in a different operation. From theoretical considerations it would appear that the best way would be to hold the gear by rolls contacting between the teeth, and this is undoubtedly correct if the gear is an unhardened one. But if the gear is hardened the teeth are likely to have become distorted, with the result that the tooth spaces are no longer of uniform width. Each roll will then enter between the teeth to a different depth, and the circle of the roll centers will no longer be concentric with the pitch circle. For such cases the best method is undoubtedly what is known as the root control method. The root circle and the pitch circle are formed in the same operation and their concentricity is not materially disturbed by the hardening process. It may be pointed out here that the accuracy of the pitch line roll support method may be improved by the use of a greater number of rolls than the three which is the least possible number that can be used. The line cut on page 426 shows two methods of holding gears in the grinding machine for grinding the bore that have been worked out by the Heald Machine Co. When using the roll method, the rolls must of course be all of exactly the same diameter.

The roll method can be improved upon by having two or

Grinding clutch disks in Blanchard grinder

Heald method of holding gears in chuck for internal grinding

three rolls on each collet jaw which will average up any irregularities that may exist in the teeth. The rolls are provided with tapering ends so as to make it easy to insert them between the teeth and also to make it easy to get them into the chuck along with the gear. They are carried loosely in a light metal ring or retainer, which allows them to enter freely between the teeth of the gear and adjust themselves to any irregularities. The mounting of the rolls in a retaining ring instead of on the collet jaws enables the operator to more easily keep dust and grit from getting behind the rolls where they would be likely to affect the accuracy of the chucking. For the sake of accuracy the rolls must be backed up by hardened steel blocks to take the pressure of chucking, as they would bed into soft material and become inaccurate. This hardened surface must be reground occasionally to maintain the accuracy. In addition to plain single spur gears, so-called spool gears, and also bevel gears must be held in the machine for grinding the bore, and fixtures for doing this have been worked out.

The halves of the gear case and the cover therefor can have their joint surfaces ground on a surface grinder, and a machine with a horizontal wheel spindle would ordinarily be used for the heavier parts.

In connection with the final drive and rear axle there are also many parts that are finished by grinding. If the machine has a bevel gear drive the crown gear is usually ground on the flange where it fits to the differential flange; the rear axle driving shafts and the pinion shaft are ground, and so are the seats for the bearings on the differential housing and in the axle housing. Grinding is also resorted to for correcting distortion due to heat treatment of the worms of worm drives. Passing to the front axle, the steering knuckle spindles are ground, as are the ball joints of the drag link, both on the ball surface and the taper surface by which they are fitted into the knuckle arms.

### Snagging Castings and Forgings

Aside from precision work, a great deal of snagging is done on automotive parts, both castings and forgings. Formerly, when a lot of castings came from the foundry, a man with a cold chisel and hammer was set to work on them to take off the rough edges by chipping, but the snagging process is a great improvement on that

method. For very heavy parts portable grinders are used, while light parts are toted to a stationary grinder, either of the floor stand or the bench stand type. Snagging is done on practically all castings and on some of the larger size forgings.

### Trimming Joints

A further use of grinding machinery in automotive shops is in trimming the rough edges of fitted joints, whether these joints be between castings, sheet metal parts or forgings or between parts of different kinds. For instance, in the Mack trucks the spring hangers are clamped to the frame and the joints are then caulked. The roughness of the caulked joints is then smoothed off by means of a medium coarse wheel. The engine bonnet and the cab of the Mack truck are built up of a combination of sheet and strip steel, and the rough edges are smoothed by means of portable grinders. The bodies are similarly gone over with the portable grinder and all projecting screw heads, burs and sharp edges are smoothed.

Grinding machinery is extensively used in the plants devoted to the production of the components thereof and of accessories the same as in plants producing complete automotive vehicles. This applies to none of the parts or allied industries so much as to the manufacture of anti-friction bearings. In fact, with the exception of the ball or roller cages, these are finished completely by grinding. Steel balls for use in ball bearings are made in special machines developed by the manufacturers of the balls themselves. The balls are made of chromium steel, hardened all through. They are ground to an approximate size and then graded by gaging.

### Grinding Ball Bearing Races

The races are turned roughly to size and are then heat-treated. After the hardness test the sides are surface-ground on rotary surface grinders with magnetic chucks; in fact this operation is somewhat similar to grinding the sides of piston rings. The S. K. F. Ball Bearing Co. uses silicon ring wheels for this operation, 18 in. in diameter by  $1\frac{1}{4}$  in. rim, running at 950 r.p.m., and removing approximately 0.006 in. of stock from each side of the ring. For turning the ball grooves in the inside rings and turning off the outer surface of the outside rings the rings are mounted on arbors in gangs. The ball grooves in the inner rings are ground by means of silicate wheels with an oscillating wheel mount which shapes the groove. One groove is ground at a time. A wheel speed of 6000 ft. per min. is used and from 0.020 to 0.025 in. of stock is re-

Grinding out the bore of a gear wheel in a Brown &amp; Sharpe universal grinding machine

moved. Both a roughing and a finishing operation are required for the outer surface of the outer ring. In roughing, the diameter is reduced by about 0.020 in., and in finishing by 0.010 in. A circumferential speed of 5500 ft. is maintained.

The grooves in the outer rings are also ground in an oscillating grinding machine. In this case, instead of the wheel carrier, the work carrying head is oscillated, and a true spherical groove is formed. Bores in inner rings are ground in automatic machines, and for the smaller sizes naturally very small diameter wheels must be used. In grinding the bores from 0.006 to 0.008 in. is removed if measured on the diameter.

#### Grinding Parts of Electrical Equipment

One of the newer subsidiaries of the automotive industry, the electrical equipment industry, also makes use of grinding to quite an extent. Formerly the completed commutators, after being turned down in the lathe, were filed and lapped with fine emery paper. To-day they are finished by grinding. The armature cores of generators and starters, which are built up of thin soft iron laminations slightly separated by an insulating varnish, so as to prevent good electrical contact between them, are now finished by grinding. Owing to the softness of the steel used for the disks and the difference in the cutting qualities of the steel and the insulating layer in between, this was always a rather unsatisfactory lathe job. In the

Grinding steel worms for truck drives (Timken-Detroit Axle Co.)

grinder, not only can the job be done more expeditiously, but there is probably less burring of the edges of the disks, with consequent better insulation. The pole pieces of generators and starters are ground to the required diameter, and often the field frames are ground for the attachment of the field poles. The grinding out of the pole pieces is a particularly delicate operation in the case of the magneto, as there the clearance is made exceedingly small.

Non-metallic parts of electrical equipment also can be finished to advantage by grinding. Thus the distributor with its molded-in metal segments is preferably finished by grinding, and the carbon brushes, which are made from extruded bars, are cut off to length by means of thin elastic wheels. The radius is ground on the bearing surface of these brushes by means of silicon carbide wheels so they do not have to be fitted to the commutator surface by hand by the consumer.

Methods of centering gears for grinding of bore (Root control and pitch line control)

## Dependence of Riding Qualities on Car Weight

**A** MATHEMATICAL investigation of the problem of vehicle suspension is published in *Der Motorwagen* of June 20 by Prof. H. Reissner. The question particularly investigated is whether it is possible to so design small cars that they will ride as comfortably as large cars. It is found that for the same road obstruction and the same vehicle speed there is no difference in the performance of light and heavy cars when the flexibility of the springs and also the damping constant (the frictional force due to leaf friction or leaf friction and shock absorber friction) are proportional to the weight of the car. Small unsprung weight of wheels and axle are of great importance from the standpoint of prevention of wheel bouncing on a rough road. Finally the conclusion is drawn that the shock reduction and the freedom from bouncing of the wheels may be made independent of the weight of the car if the static compression (which should be a maximum) of the springs under load and the ratio of the unsprung to the sprung weight (which should be a minimum) are made the same for both types of car.

Prof. Reissner says he has found that small cars in general are less well sprung than large cars, and he admits that the objection may be made to the principle laid down by him that it is more difficult from a design standpoint to provide the same static spring deflection

in a small as in a large car, because it is generally desired to have the light car lower; also that in the case of the light car there is a greater difference between empty weight and loaded weight, and if the car is sprung for full load the springing will be poor when running with small load. However, the solution of the problem of adequately springing the light car is so important to the success of this type of vehicle that it must be found.

#### Further Lamp Standardization by S.A.E.

**T**HE standardization of tail-lamp overall dimensions and mounting screws has been undertaken by the S. A. E. Standards Committee. At the present time there are a great variety of mountings used which could easily be reduced to one standard design, acceptable to both the lamp and the automobile manufacturer.

Standardized tail-lamps can be mounted on either the right or left-hand side of the license plate, thus eliminating the necessity of making right and left-hand lamps which is the practice at present. The tail-lamp dimensions recommended are in accordance with present practice.

It has been suggested that the present S. A. E. Standard for lamp glasses, be extended to specify the dimensions of the locking lugs of the head-lamp glass rim so as to prevent the glass turning in the lamp, which is a matter of importance in other than plain lamp glasses.

# A Forward Step in Practical Merchandising Research

The general phases of territorial analysis were discussed recently in *AUTOMOTIVE INDUSTRIES*. This article describes how one automobile manufacturer is getting practical results from commercial research. The scope of the work is outlined and valuable suggestions are given.

By Norman G. Shidle

**T**HERE are two big questions waiting to be answered accurately in detail at most automotive manufacturing plants. The first is, "What data have we at hand upon which to base an intelligent and intensive merchandising plan?" The second question is a continuation of the first and may read, "What other data do we need, how can we get it and how can we use it effectively after having obtained it?"

To adequately answer these questions means to establish and develop a sound merchandising program which will carry on successfully through the period of competition which lies ahead. Because the need for an answer is so pressing, it is interesting to examine the work which various companies are doing along this line. The beginnings of a broad plan, for instance, are now well under way at the H. H. Franklin Mfg. Co., and some constructive results have already been achieved after only a few months of effort.

A Commercial Research Department has been established at this plant to carry on a substantial part of this work in co-operation with the sales and advertising departments. All these are supervised and co-ordinated by the Director of Distribution.

The functions outlined for the Commercial Research Department at its inception indicate concretely the scope which its work is to take. These functions are as follows:

1. To lay out boundaries of dealers' territories along scientific lines and review contracts negotiated by the sales department.
2. To gather statistics bearing on the markets in which the company buys and sells.
3. To predetermine what the sales performance should be for the market as a whole and for each dealership.
4. To figure quotas and schedules for the market as a whole and for each dealership.
5. To keep statistical records of dealers, subdealers and salesmen's performance.
6. To analyze sales performance and point out faults and remedies.
7. To forecast economic conditions in markets in which the company buys and sells.
8. To analyze, construct or carry out routines and sales promotion plans, investigate methods, practices and policies.

The striking thing about this outline is the definite manner in which it states the various angles of the merchandising problem which confronts the automobile manufacturer. It indicates the basic lines of research to be laid down as a foundation for the conception and development of sound selling plans. To properly perform these functions, the department has been divided into four divisions, each of which performs a specific function.

One division takes care of general work, such as research investigation, questionnaires, charts, methods, routines, forecasts, general file, sales promotion ideas and all special work referred to the department. In regard to the last item, it is interesting to note that this department has become a sort of clearing house for merchandising problems of various kinds referred to it by all branches of the selling and advertising organization.

A second division takes care of the various selling campaigns which are continually being operated. The entire dealer organization and dealer salesmen, for example, has been mobilized into the "Franklin Army." The salesmen take rank in this army in accordance with the results of their sales effort and, on the basis of his monthly sales record, a man may rise in rank from private to general.

The work of this division, assisting as it does the advertising and sales departments in promoting and devising these monthly and other periodic sales campaigns, has been a large factor in stimulating sales during the dull times and has been one of the most effective means of keeping the factory at capacity production during recent months. The work of this division includes awards of bonuses to salesmen and dealers, "Army" sheet records, dealers' and salesmen's records for prize campaigns, monthly sales campaigns, special reports to advertising department, special notices for *Salesometer*—the salesman house organ of this company—custody of order and delivery reports, etc. These order and delivery reports are discussed in greater detail at a later place in this article.

A third division handles all routine reports not included in the second division, such as cars in transit, dealers' and subdealers' stock on hand, demonstrators, wholesale and retail deliveries, car-record cards, car owner cards, etc.

The fourth division handles what is perhaps the most interesting phase of this commercial research work. Its task includes territorial studies, quota studies, schedule studies, review of new contracts, outside statistics, such as population, registration, wealth and economic production; map records, etc.

## Territory Layout

The work of properly laying out territories has been one of the major tasks. Proper territories cannot be laid out with reference only to a map. Factors such as transportation lines, major highways, urban spheres of influence, etc., must all be considered. The ideal merchandising plan, however, is one which is predicated upon small territories, intensely cultivated.

This new department has taken up the work of scientifically laying out territories. Although it is operating

Fig. 2

conservatively and is correlating its studies with the necessities of present conditions, excellent progress has been made.

One of the first problems encountered by this department was that of bringing up-to-date data concerning the number of Franklin cars already in use in each of the various sales territories. This work was done outside the company by a statistical organization employed for the purpose. The information was essential, however, to the making of future plans and to the establishing of quotas.

Next a plan for keeping this information up-to-date at all times was worked out. This is accomplished by means of three forms, each one of which is filled in by the dealer. The first is an "Order Report" and is filled in by the dealer and mailed to the factory at the time an order for a car is taken. The second is similar to it, except that it contains an extra line, which records the actual delivery of the car. The third is kept by the dealer as his record and contains all the facts on the other two. A sample of this third form is shown in Fig. 1.

By means of the form in Fig. 2 the factory is kept informed as to the exact status of every Franklin in every dealer's territory, including those cars which have changed hands. This weekly report is filled out by the dealers and mailed to the factory. Fig. 2 shows both sides of this form.

On the basis of the data compiled and kept up-to-date from these forms, it is possible to make up one factor in the formula for determining quota. Moreover, a close examination of these forms will reveal to the sales manager a number of other advantages to be gained from so highly developed a system of dealer control and co-operation.

The form shown in Figs. 3 and 4 are, to a large extent, explanatory and illustrate further the possibilities of close merchandising control of the dealer organization. Fig. 3

shows the form on which county deliveries and registration are recorded from month to month, the county being a fixed territorial unit, whereas dealer boundaries include often several counties and are subject to change.

By means of this record it is possible at any given time to determine readily how the dealer who controls this county is keeping it up to quota, the variation in his sales curve, and the quality of his performance in this county as compared with that of competitive cars. The blank columns are used for posting performance of competitors.

Fig. 4 is a comparative record of the dealer's sales performance for his whole territory. At the top of the sheet is placed the sales quota for the year, the number of Franklins to a unit of population and the percentage of total deliveries that should be Franklin sales. An examination of the details of this form will show the variety of valuable merchandising information which its record gives to the sales manager.

Before such a form can be used, however, it is obvious that considerable foundation work must have been done; certain standards of performance must have been set up. The work of this research department, consisting partly of the gathering of the data described in Figs. 1 and 2, is to set up such standards and to change them from time to time on the basis of newly ascertained facts.

#### Territorial Analysis

One of the chief problems of interest to the automobile sales manager is that of accurate territorial analysis; the determining as closely as possible of just how much business is actually available in a given dealer's territory. Thus, a quota can be established and sales performance checked against this standard.

The establishing of territorial quotas has been studied closely by this new Franklin department and a satisfactory formula for present practical use has been worked out on

Fig. 3

Fig. 4

**A** BILL now before the Spanish Chamber provides for an expenditure of 648,000,000 pesetas on roads and bridges, 493,000,000 for the repair and upkeep of main roads, 157,000,000 for local roads, 900,000,000 for hydraulic works; 60,000,000 for lighthouses, etc., 110,000,000 for agricultural establishments and machinery, and 44,000,000 pesetas in connection with the mining industry.

# French Manufacturers Turn to Medium-Priced Cars

Many French automobile manufacturers, previously producers of high-priced models, are about to take up the production of cheaper and more economical cars. Panhard-Levassor is expected to bring out new model with very small Knight engine, while Peugeot has in preparation a small rotary valve engine. Use of overhead valves increasing.

By W. F. Bradley

**S**ALES revived during June and July in the French automobile industry, but have dropped off for August, and are not expected to pick up again until after the fall shows. All factories are now working on the new or modified models which will be revealed to the public at the Paris show, scheduled for Oct. 5.

Speaking generally, all firms are getting down to smaller and more economical types. A few of the factories having started out after the war with medium size cheap cars will round off their production with a high class model, but in a greater number of cases firms having started with costly types will take up the production of cheaper and more economical cars. Among those coming into this category are Hispano-Suiza, Voisin and Delage, all of whom catered in 1920 for the luxury class only. Panhard-Levassor is expected to bring out a car with the smallest Knight engine ever built, the bore being only  $2\frac{1}{2}$  in. Peugeot is preparing a small rotary valve engine.

There will be a big increase at the next show in overhead valve engines, many of these having the camshaft in the basechamber, the valves being mounted in the detachable head. This design is preferred because of the cheapness of construction compared with the overhead camshaft. There will be an increased number of three-speed gearboxes; magneto ignition will lose a certain amount of ground, and four-wheel braking systems will gain. Cyclecars are receiving a lot of attention, but the big movement will not be for next year. Although the old prejudice against straight side tires is dying, there are no indications that Continental makers will adopt these tires as standard for next year. The change, when it comes, will at first be gradual, and it is premature to expect even the beginning of it for 1922.

The Brasier factories, both in Paris and at Grenoble, have been closed and it is doubtful if they will be reopened. This firm, which is one of the oldest in France, increased enormously in importance during the war, and had to erect a special factory at Grenoble for the production of airplane engines. Conditions have been very unsatisfactory since the Armistice, and notification of the winding up of the concern is expected daily.

Peugeot announces a considerable increase in sales during the past four months, the turnover being on a steadily increasing scale and the month of July breaking all records since the company existed. For the Paris district alone the sales were 3,180,000 francs for the month of July. Production at present is 700 automobiles per month, as follows: 400 10 hp. cars, 90 to 100 14 hp. models, 175 small two-seater Quadriettes, and about 30 of the six-

cylinder 25 hp. model. There is a growing demand for the cheap Quadriette, and arrangements are in hand for an increase of this model only to 600 per month. Peugeot is building 250 motorcycles and 9000 bicycles per month. In the experimental department work is being completed on a 50-hp., two-cylinder, two-stroke engine which will run on any fuel from high-grade gasoline to crude oil, and will start up as quickly on heavy as on light fuel. This engine is at present being used for stationary work, but it is intended later to fit it into a 5-ton chassis.

Renault, in addition to passenger car production, is devoting a lot of attention to stationary engines and factory equipment. Among the new productions is a 10 hp. stationary engine running on either gasoline or kerosene, entirely enclosed for service in factories and workshops containing inflammable material, such as saw mills and wood working shops. A marine type heavy oil semi-Diesel 40 hp. engine is also in production, as well as a horizontal 80 hp. semi-Diesel. Renault is also devoting attention to small house lighting sets, the electric part of these being furnished by the S. E. V. Company, in which he holds important interests.

The Gobron Company, which has been dormant since the war, will shortly come on the market with a high grade six-cylinder valveless type. Berliet, while continuing passenger car and truck production, is devoting more and more attention to the repair of locomotives and the building of light railroad material.

Ballot, who up to the present has devoted himself to engines, announces that he is putting into production a series of 100 chassis exact duplicates of the two-litre four-cylinder machine with which Goux won third place at an average of 72 miles an hour in the recent French Grand Prix. This car is a four-cylinder of 69 by 130 mm. bore and stroke, of the same general design as the eight-cylinder models seen at Indianapolis, and is fitted with front wheel brakes. Deliveries will begin in November.

Bugatti is working on a high grade overhead valve eight-cylinder in line job, which probably will be out in time for the shows. An eight-cylinder in line is also in production at the Cottin-Desgouttes factory at Lyons.

Bayard-Clement and Lorraine-Dietrich, two firms which united forces about a year ago, have recently separated and are working independently. Lorraine-Dietrich is under the technical management of Engineer Barbarou, who has produced a six-cylinder overhead valve car of high quality but designed with cheap production in view. In addition, the firm is producing a limited number of two types of high grade costly cars.

## Uniform Braking on Four Wheels

Editor, AUTOMOTIVE INDUSTRIES:

We have been following, with considerable interest, your articles in discussion of brakes, particularly the article on Four-Wheel Brakes in your annual engineering number, together with the letters accompanying it, and your recent article on Brake Lining Tests.

The trend is, apparently, in the direction of four-wheel brakes, and any engineer who has driven a car at a reasonably high speed on a rough down grade appreciates the tremendous advantage of four-wheel brakes, enabling quicker stops, smoother stops and less of that vibrating chatter of the rear axle and sliding of tires that are so noticeable with two-wheel brakes on rough hills.

In your article on Brake Lining Tests at the Bureau of Standards, Mr. Carson, of the Johns-Manville Company, points out one of the big factors that has restricted the development of four-wheel brakes on American motor cars—that is, the variation in co-efficient of friction of the brake lining, which makes it impossible with present braking systems to get even braking on four wheels without continual adjustment.

American designers know their public very well and know that the average owner would never give this adjustment proper attention; but will, instead, complain of the car when he suffers from the effects of his carelessness and neglect. This fact, combined with the cost of the average four-wheel system, with its complicated equalizers, has been, we believe, one of the reasons why four-wheel brakes have not been more widely adopted by American designers.

This company has made a very extended study of brakes and has come to the conclusion that the only manner in which to safely handle the high speeds of modern automobile practice—both trucks and passenger cars—is to brake on all wheels. The difficulty of equalizing—not the pulling on the brake rods but the actual braking—resulted in our devising a system of self-adjusting brakes for automobile use; that is, brakes in which the friction between the drum and the shoe regulates itself, thereby assuring absolutely uniform braking on all wheels; and, if combined with an automatic take-up on the brake rods, the elimination of any attention to the brakes from the time the car leaves the factory until it is necessary to reline the shoes.

Horace Remote Control Co.

## Testing Aluminum Castings

Editor, AUTOMOTIVE INDUSTRIES:

The article by Dr. Walter Rosenhain, printed in your issue of Aug. 4, presents a controversial issue which is always associated with a preparation of test specimens. The Engineering Standards Committee of Great Britain specifies that aluminum test bars shall be cast in a permanent iron mold and that the mold shall be heated. Dr.

Rosenhain evidently indorses this view. On the other hand, the American Society for Testing Materials and most bodies with which the writer is acquainted, who exercise the function of specifying for test specimens, call for the bars to be poured in green-sand molds.

It is certainly the carefully considered opinion of most engineers on this side that the sand-cast coupon will, in spite of superficial judgments to the contrary, prove to be more consistent in its results than the specimen cast in a metal mold and most particularly is this true of aluminum. Only those who are intimately associated with the business of producing aluminum castings in iron molds know the multitude of factors which modify the product. Such influences as the temperature of the mold and the rate of pouring will seriously affect the quality of the casting, and it is no doubt this reason which has led standardizing committees in the United States to adopt the sand-cast test bar as the standard.

In spite of what Dr. Rosenhain says to the effect that a designer is not apt to be misled by the higher qualities arising from a permanent mold casting, I feel it would be open to criticism if out of two pretty good methods of testing, we were to choose deliberately the less conservative one.

In the light of our present experience, therefore, the best form of test bar for aluminum alloys is certainly the one cast in the green-sand mold, designed with a medium-sized riser at one end and pouring gate on the other, the mold inclining upward at a very small angle from the gate to the riser. ERNEST V. PANNALL.

## Poor Batteries an Economic Waste

Editor, AUTOMOTIVE INDUSTRIES:

I have read the editorial in the AUTOMOTIVE INDUSTRIES of July 21st, entitled, "What's the Difference." It was very good and to the point and I am glad to see that this question is being taken up and discussed because there is a big economic waste in the unnecessarily short-lived storage batteries which is coming out of the user's pockets, as was indicated in the editorial.

Observation has shown me that overcharging a battery shortens its life more than anything else.

Some years ago I developed a system of taper-charge-regulation that would overcome this deteriorating fault. This method of regulation and the adoption of a battery of proper size for the work would give a system that on the average would make the battery last five or six years.

I compliment you for tackling this question.

VINCENT G. APPLE, Proprietor,  
•Vincent G. Apple Laboratories.

THE Electrical Research Association of Great Britain is actively interested in furthering the manufacture and use of electrical insulating materials made from synthetic resins and varnishes and having the well known heat resisting characteristics associated with some of these materials. Leading manufacturers and users of the raw materials and finished products are co-operating.

# The Human Element as Related to Standardization and Uniformity

A standard is something as nearly accurate as we can secure, by which similar processes may be measured. Uniformity implies a repetition of the same process. The effect of uniformity upon the human element in production must be considered or false premises may be established.

By Harry Tipper

**A** LITTLE discussion has been occurring in the Forum of AUTOMOTIVE INDUSTRIES in regard to standardization that has interested me because the question of standards has been brought up a great many times in connection with the efficiency of industry.

We are apt to think that we have a very clear and logical terminology in connection with our scientific applications, particularly in engineering, chemistry and similar branches. When definitions are sought, however, we begin to discover curious differences in these definitions as they are produced by the various authorities. The terminology indicates a degree of inexactitude not quite consistent with our general understanding and leading to a good deal of misconception in the discussions that occurred.

In this question of standards and standardization there seems to be a confusion between arriving at a standard and merely agreeing upon a uniformity. There is a vast difference between the two and a proper discrimination is necessary if we are to proceed along the right lines and to correct our past mistakes as we go along with future development.

A standard is something as nearly accurate as we can secure, by which every similar process can be measured in an endeavor to determine its accuracy. It is an ideal to which we expect to work as nearly as the practical limitations make it possible. This standard has nothing to do with the method of development, or the uniformity of the process. It makes the result as nearly interchangeable as the approach to the standard insures its accuracy, but it does not argue a similarity of method or process or a uniformity of development.

Uniformity, on the other hand, implies a repetition of the same process without any variation or change and without any reference to the ideal situation. The uniformity of the method may be the poorest means of arriving at a high standard, if the standard is difficult and requires a large measure of delicate understanding.

The object of all endeavor is to arrive at a high standard, one more accurate or closer to perfection.

The uniformity of the method is not dictated by the necessity of reaching a high standard, but is made necessary by the employment of machinery subdividing the work. Under these circumstances a uniformity in similar operations is necessary to the more rapid production.

No one would say that the standard of accuracy reached by the old instrument maker was any less than the standard reached by the producer of instruments

to-day. In fact, the skilled instrument maker of the craftsman period produced instruments of a higher degree of effectiveness than anything we have been able to produce under present conditions.

There are few men who can make a standard of mathematical measurement so accurate that it is fit to be used as an ideal by which to measure other work. These instrument makers in the past worked by hand. They did not use uniform methods of producing their instruments. Nevertheless, they reached a high standard of efficiency in the result.

As soon as one man was told off to make a small portion of the instrument and to confine his attention to that only, uniformity became necessary in order that the pieces he made should be interchangeable, permitting of their use in the assembly of any instrument.

Standardization as an ideal of efficiency and accuracy is a very important element in the improvement of production.

Uniformity of operation is only important as it serves the conveniences of industry, and events may prove it to be detrimental if it is carried too far in its development.

The continued improvement in industry is dependent upon the continued discovery of more efficient methods of production, more readily adaptable to the particular problem of production. This improvement depends, therefore, upon the alertness of the human being and his continued incentive for alertness in connection with his work.

Uniformity may destroy that capacity from complete disuse or so weaken it from lack of necessity that it becomes practically non-existent.

Furthermore, skilled labor must retain a fair degree of adaptability in order that the laboring population should be adapted to the requirements of the various industries under any ordinary conditions. Machinists would not be skilled at any other trade except machining, but they ought to retain within that trade a certain measure of adaptability in order that the varying requirements of employment in the different branches of machinery may be taken care of by the flow of this more or less flexible skill.

Uniformity has a distinct tendency to remove this adaptability so that the worker is unable to become skillful in any except the operations to which he is accustomed.

It is under these circumstances labor becomes more and more inflexible and unemployment a more serious problem because of this rigidity.

In Great Britain where complete employment of all the working population is a rare condition, the increasing rigidity of labor in its specialization is a very acute problem and adds its difficulty to the other elemental troubles in the situation.

Only the supervisors who have struggled with the rearrangement of operations of a highly repetitive character are aware of the unbelievable specialization which comes out of this repetitive work and which makes it almost impossible for the workers to adapt themselves to any kind of change.

The question of a standard is a different one from this question of uniformity of operation and must be approached from a different standpoint.

**The designing of the mechanical appliances must, in the course of time, take account of the difficulties arising out of the uniform methods of operation and the inaccuracies that may result from the confusion between the uniformity of method and standardization of result.**

**The costs of manufacturing are affected themselves to a very great degree by the increasing rigidity of labor arising out of this uniformity of operation.**

Some time ago four men interested in large manufacturing concerns were lunching together. One of the men was an important executive of a company which controlled the majority output of that field. They had just bought out a new small company. They were confronted with the problem of discontinuing the special brand, the property of the company they had acquired, and absorbing it into their general brand, or maintaining it as a special brand and selling it through their own organization. Incidentally to this problem the men remarked that if they absorbed it into their general brand, they would be obliged to charge

more for it. This remark interested me very much. I said, "How is it that with all your facilities, ability to buy in quantity, special machinery, and other items of production improvement, you are unable to manufacture as cheaply as a small competitor?"

His reply was, "I don't know the exact reason, but I am beginning to suspect that we get less efficiency out of the individual."

Flexibility of labor is one of the elements of efficiency.

No factory can be so balanced in its work at all times that there is an equal necessity for labor in all departments and that the business of each department occupies fully the time of the workers to an equal degree.

Some flexibility of the workers' time is necessary if the costs are to be kept down, even in this respect; although the biggest element of cost is the tendency toward the establishment of a minimum pace and the fatigue arising out of the monotony.

**Interchangeability is necessary to modern production to a considerable degree. A fair degree of specialization is necessary, but when those elements begin to reach a rigid uniformity of operation, system and method, supervisors and workers are inhibited by that uniformity so that they become rigid in their capacity and narrowly specialized in their thought, with the result that alertness is destroyed, flexibility of thought and operation are limited, and the general efficiency materially lowered.**

To reach a high standard of manpower efficiency is just as important as to reach a high standard of product efficiency. Both of them should be measured and uniformity of operation should be considered in its proper place as a convenience of development depending for its value upon its reaction in connection with both these standards.

## Effect of Dilution of Charge by Spent Gases

**A**FTER a long study of the effects of fuel economy of automobile engines, the Bureau of Standards' experts have concluded "that the dilution of the charge by the spent gases remaining in the clearance volume makes it impossible at low throttle to employ those air-fuel ratios which if they could be fired would yield the maximum efficiency. If the exhaust gas that is present during normal operation forms a barrier to the use of high-efficiency mixtures, then surely the designer ought to avoid any devices for adding still more dead gas to the charge."

In adding exhaust gas to the induction system, a higher thermal efficiency has been the goal. Some investigators have found that increasing the amount of inert gas in the charge tends to prevent fuel knock and hence enables a high compression ratio to be employed. Since thermal efficiency depends upon the expansion ratio, which in the conventional engine equals the compression ratio, it should be higher with a higher compression ratio.

Full throttle tests apparently show such to be the case and from these results it has been concluded that the addition of exhaust gas will be even more beneficial at part throttle. It is assumed that under such conditions a decrease of power is of no consequence and that the heat of the exhaust may be of considerable aid in vaporizing the fuel. Since in service the automobile engine is operated at part throttle most of the time, it is under this condition that economy of fuel consumption is most important. Therefore, the Bureau has given considerable attention to the effect of admitting exhaust gas under such circumstances.

Nearly all investigators have noted that under light loads the engine will not fire mixtures having as high a rate of air to fuel as that which gives the best economy at higher loads. This is probably because the inert gas with partially opened throttle forms so large a proportion of the total charge. The compression pressure is, of course, also too low and many experimenters have ascribed the poor efficiency to this cause.

To prove that the proportion of the exhaust gas is the predominant influence, an engine partly throttled was operated with the leanest air-fuel ratio with which it would fire regularly. The engine was again operated with a sufficient amount of exhaust gas admitted with the charge to reduce the engine power to the same value as had been obtained in the first test by throttling. Although the pressures in the latter case were considerably higher than before, not nearly as high an air-fuel ratio could be fired and lower thermal efficiency was the result.

**A**RECENT investigation conducted by the Bureau of Standards had for its purpose the demonstration of the structural changes which occur in hardened steels upon tempering. It has now progressed far enough to show that there is a decided change (best seen in high-carbon steels) brought about by tempering at approximately 240 deg. C.

In other cases the changes which occur are relatively inconspicuous and this accounts for the surprising lack of data of this kind in the literature, although an immense amount of work has been done upon the subject of hardened and tempered steels.

## Convenient Crankcase Drains

ONE of the oil companies has called attention to the need for more convenient oil drains on crankcases. The present provisions for draining the oil on the majority of cars are certainly very unsatisfactory. Not only is the job tedious and very dirty, so that the operator instinctively shrinks from it, but in the case of cars having splash lubrication it is impossible to drain the splash troughs in which a good deal of the sediment collects. In earlier designs of engines having oil pans with the splash troughs cast in, drain cocks were occasionally provided for each trough. A boss was cast through the oil well from the lowest point of the splash trough. This was drilled and tapped and a drain cock was then screwed in. But later the cast oil splash troughs were practically discarded and sheet metal troughs substituted therefore. These troughs are pressed in a plate which is inserted into the lower half of the crankcase, and it is therefore impossible to drain them through the bottom of the crankcase. All sediment collecting in the troughs remains there until the lower half of the

crankcase is removed for the purpose of adjusting the bearings. Of course, as long as the engine is in operation the oil in the splash troughs is kept constantly stirred up and any solid particles held in suspension by it have hardly time to separate out, but sedimentation will certainly occur while the engine is standing.

As long as splash lubrication is used in conjunction with sheet metal splash troughs it will be almost impossible to provide means for draining the troughs. The remedy would seem to be to discard splash lubrication altogether, and engine design is now headed in that direction. The problem of providing convenient means of draining the sump remains, however. At the present time, instead of a mere plug, a plate is often provided to which the oil strainer is secured. As soon as one or two of the nuts holding the plate in place are loosened the oil begins to drip, if not to run, and the person removing the plate usually gets a good deal of oil on his clothing.

The solution of this problem is difficult. An ordinary drain plug, operated through an extension handle from the side of the car, would hardly suffice, as the drain passage would be too small and little of the sediment would be carried along by the flow of oil. Poppet valves opened and closed from the side of the crankcase would meet the requirement of easy operation and rapid flow, but it is hardly likely that an oil-tight closure could be effected with them, as particles of grit would be almost sure to adhere to the surface of the valve and prevent good seating.

## Careless Wiring of Cars

CAR manufacturers whose product has the best reputation in the trade as well as some whose product is not so well thought of are coming to understand that a car which is free from trouble caused by careless or indifferent work in production or assembly, is a great asset, while the worst of "black eyes" may result when the reverse is true. Thousands of repeat orders come with little energy to the maker whose car has a well-founded reputation for dependability, but the sales resistance to a product which continually calls for the attention of the repairman is greatly increased. There can be but little question that time and money spent in overcoming resistance of this kind might far better have been spent in eliminating the source of trouble in the first place.

One prolific source of trouble in many makes of cars to-day is due to poorly laid out and carelessly executed jobs of wiring for the electrical units. Grounds, short circuits and loose connections occur at times in the best of jobs, but they are much more frequent in the job which is indifferently done. In general wiring should be enclosed, but still left as accessible as possible. In every case it should be well supported to prevent abrasion from vibration, and so located as to be protected from oil and other mediums which tend to cause the insulation to deteriorate.

The average garage mechanic is far from adept in locating electrical troubles, and some of these troubles have often puzzled the most proficient electrician. An

intermittent ground or short may require many hours to locate, and sometimes a number of trips to the shop before the difficulty is finally run down and repaired. In the mean time the owner, who understands little or nothing about electrical apparatus is chafing and impatient because his car is laid up, perhaps when it is only a few weeks old, and the things he thinks and often says about the manufacturer are hardly to be construed as good advertising material.

Most of such difficulties can be overcome by:

1—Seeing that the wiring layout and the materials used are the best possible under the conditions imposed as to price, etc.

2—That the workmanship is first class.

3—That rigid inspection and check tests are applied before the job is approved.

In the performance of the modern car so much depends upon the proper functioning of the electrical equipment that care in seeing that it is well selected and installed will assuredly pay the car builder who gives it requisite attention.

## The ZR-2 Disaster

THERE can be little doubt that the fatal disaster to the ZR-2 at Hull, England, last week will prove a great setback to commercial aviation. The ship was the largest of her kind ever built; she had apparently passed successfully through her preliminary trials and was getting ready for her trip across the Atlantic when the accident occurred. The great loss of life is to be deeply deplored, the more so because among those killed were some of the most experienced men in England and America in the art of operating dirigibles. The heavy material loss involved in the accident also will act as a deterrent to enterprise in the development of commercial aviation.

From the accounts of eye witnesses and survivors it is fairly obvious that the primary cause of the disaster was insufficient rigidity of the girder structure. It may seem surprising that an accident due to this cause should have come only after the ship had been in the air for 35 hours. The probable explanation is that up to just previous to the time of the accident the big ship had never been operated at full power. From all accounts at the moment of the accident the engines were being "let out," and the controls were being tested. Now, the girder structure of a rigid type of airship is naturally subjected to the greatest strains when either the elevators or the rudders are set at sharp angles and the engines are simultaneously going at full speed. There had been reports of the development of structural weaknesses previous to the accident, but it appears that reinforcements had been made and it was thought that a sufficient degree of safety had been attained, which unfortunately proved incorrect.

Many of the reports had it that a gasoline tank exploded, but it is much more likely that the explosions which occurred were due to the hydrogen. If the breaking of the girder work occurred before there was an explosion, as seems to be the case, the gas bags containing the hydrogen were rendered very vulner-

able, and once one of these bags was ripped open, ignition or the escaping gas by flame from the exhaust would be almost inevitable. Liquid gasoline cannot explode, and there is only comparatively little gasoline vapor in the fuel tanks at any time. The tremendous force of the explosion further supports the assumption that it was the hydrogen that exploded.

During the war a great deal was written regarding the possibilities of helium gas for use in dirigibles, and much money was spent in experimental work on the extraction of this gas from natural gas, both in this country and in Canada. While a non-combustible buoyant gas would be of particular value in war time, because it would render a dirigible practically immune to attack with incendiary bullets, it would also greatly add to the safety of peace time air travel. Had such a gas been used in the ZR-2 it would not have prevented the accident, though it is conceivable that under the conditions under which it occurred it might have considerably reduced the number of fatalities. Still, if the failure of the hull had occurred on the ocean trip—and the ZR-2 was intended mainly for ocean cruises—the final result would probably have been substantially the same with a non-combustible gas.

There is one lesson of the disaster that should not be lost on designers and promoters of enterprises connected with dirigibles. For the sake of safety the limits of size and flying range should not be advanced too rapidly. Weakness in the girder structure may be ascribed to the desire to obtain the greatest possible buoyancy, so that the ship would have a large flying radius and could carry a large crew and cargo. While the transatlantic flight was shown to be possible by the trip of the R-34, it must be remembered that that vessel made the westward trip with only a very narrow margin in fuel capacity—so small, in fact, that a wireless call for aid was sent out. It was obvious after the trip that for safety under all weather conditions a greater relative fuel capacity was necessary, and with a ship of the same displacement this could be obtained only by lightening the hull or other parts which means a lower factor of safety structurally, unless the state of the art is materially advanced. A more gradual increase in flying range, together with extensive use of all types developed before undertaking new and more ambitious designs, would result in reducing the risks that must of necessity be incurred in this line of work.

## The Unemployment Conference

THE proposed conference on unemployment announced by Herbert Hoover will be followed with great interest by automotive manufacturers. That a certain moral obligation rests upon manufacturers in this connection is rather generally recognized. Ways and means of meeting that obligation in fairness and justice to all concerned are not readily visible.

If the proposed conference can throw any light upon this phase of the question it will be performing an excellent work.

# Improvement Seen in M. A. M. A. Survey

## Prospects for Fall Given in Analysis

### Industry Actually Moved Forward in Face of Normal July Slump

NEW YORK, Aug. 30—During July the automobile industry not only held its own in the face of the normal seasonal slump, but actually moved forward. The basic betterment of underlying conditions, as revealed by a searching analysis of current financial and commercial factors, gives promise for continued improvement, which should be more marked in September and October.

This is the significant feature of the regular monthly survey made public today by the Motor and Accessory Mfrs. Association.

The concentrated experience and precise financial reports of more than 300 representative manufacturers of units and equipment for passenger automobiles and motor trucks form the basis for the association's statistical charts.

### Parts Buying Increases

Purchases of parts, units and accessories by the vehicle builders increased 1½ per cent during July over June. Further encouragement was seen in the fact that the totals of notes outstanding decreased almost 8 per cent. The only unfavorable factor indicated by the month's figures was an increase of 10 per cent in the totals of past due accounts reported.

The month-by-month percentage changes, beginning last January, follow:

Month	Per Cent Change*	Per Cent Change**	Per Cent Change***
January..			
February 66.15 Inc.		17.07 Dec.	39.08 Inc.
March .. 33.30 Inc.		16.57 Dec.	16.38 Dec.
April ... 32.93 Inc.		4.49 Dec.	5.94 Inc.
May .... 60.13 Inc.		15.64 Dec.	16.77 Dec.
June .... 15.19 Dec.		4.79 Inc.	10.37 Dec.
July .... 1.68 Inc.		10.79 Inc.	7.90 Dec.

\*Purchases of parts, units, equipment, etc. by automobile passenger car and motor truck makers from 300 parts and accessory manufacturers by months—per cent change.

\*\*Totals of past due accounts reported—per cent change.

\*\*\*Totals of notes outstanding—per cent change.

### Managers Optimistic

Credit managers and general executives of parts manufacturing concerns are now inclined to take a more optimistic view of the present situation and immediate prospects, and they point to releases on deferred shipments, new orders and better collections to justify their constructive outlook. The vague feeling of alarm and discouragement

which was evident in some circles several months ago has been largely eliminated.

"We are too busy making business to have time for the blues," remarked one official in touch with many of the largest concerns in the industry.

The prevailing sentiment in the automotive field is reflected by the following typical statements, reported verbatim, at credit interchange group meetings held within the last fortnight:

### All Reports Favorable

"Business with us is somewhat better than it has been for some little time; in fact, we notice quite a substantial improvement with the reduction in prices on popular priced cars, although our sales are not anything like what they were a year ago. We have business booked now going until Sept. 15 or longer."

"Our sales have improved gradually from April 1 up to the present time; in fact, our sales for the month of July were very good and they are still holding up. June and July exceeded our sales for the same months last year. Of course it is true that our sales did not amount to a great deal in those months last year. Our collections have also been very good. We were a little doubtful about August, but were very much gratified up to yesterday. So our business, really, is showing a decided improvement."

"Our business this year in our products has been, of course, not anywhere near what it was last year but July has been much better than June. In fact June took quite a slump under May; but July was some better than either May or June. Collections are good as a whole. Some small accounts are feeling the strain of their own poor collections; on what we term miscellaneous business, collections are hard to get. We have had to take weekly payments and do a lot of things that we didn't a year ago. However, the losses, handling it in that way even, have been small. So the little fellow apparently has been able to make some collections and do some business; in other words, he is getting a living but probably not much more."

## Appoint Committees for M. A. M. A. Convention

NEW YORK, Aug. 30—Committees for the "Back to Normal" Credit Convention of the Motor and Accessory Manufacturers Association, were announced to-day by General Manager M. L. Heminway. The Detroit Committee of Arrangements will consist of: C. W. Dickerson, (chairman), vice-president, the Timken Detroit Axle Co.; E. R. Ailes, treasurer, Detroit Steel Products Co.; M. A. Moynihan, secretary, Gemmer Mfg. Co.; William Hendrie, secretary, Detroit Gear & Machine Co.; Thomas M. Simpson, credit manager, Continental Motors Corp.

The honorary committee, consisting of the association's board of directors in Detroit, has also been appointed. These will comprise: A. W. Copland, (chairman), president, Detroit Gear & Machine Co.; C. H. L. Flintermann, vice-president, Detroit Pressed Steel Co.; E. P. Hammond, president, Gemmer Mfg. Co.; F. Glover, vice-president, Timken-Detroit Axle Co.; G. W. Yeoman, vice-president, Continental Motors Corp.

## Court Order Removes Kelly Tire Receiver

### Bankruptcy Affairs Again Left in Hands of Bridgeport Bank and Attorney

BRIDGEPORT, CONN., Aug. 30—Former Congressman Augustine Lonergan of Hartford, named receiver of the Kelly Tire & Rubber Co. of New Haven three weeks ago, has been removed by an order filed in the United States District Court in that city by Judge Edwin S. Thomas. The bankruptcy affairs are left, as they formerly were, in the hands of Attorney Albert H. Barclay of New Haven, and the City National Bank of this city, who were appointed by the Superior Court of New Haven County.

The appointment of Mr. Lonergan as receiver, it is explained, was made without notice to the corporation or the State receivers, the latter appearing before Judge Thomas at Norwalk the 22d and, through counsel, moving to vacate the appointment on the grounds that there was no legal reason for Mr. Lonergan's appointment. The State receivers, through counsel, set up that the appraised value of the company is more than \$540,000 and the indebtedness less than \$200,000. They also allege that the parties who brought the involuntary petition in bankruptcy are not creditors but four stockholders with small holdings, that the company is not insolvent and a receiver in bankruptcy would interfere with the adjustment of the corporation's affairs.

Former Congressman Lonergan was appointed receiver of the Kelly Tire & Rubber Co. by Judge Thomas at South Norwalk, Aug. 4. The appointment was made on petition of Benedict M. Holden of the Hartford law firm of Holden & Peck, representing the stockholders' protective committee, consisting of Nathan D. Prince, vice-president of the Hartford-Connecticut Trust Co.; C. L. Holmes, president of the Waterbury Trust Co., and John T. Manson, president of the First National Bank of New Haven.

### TOOL SALVAGE TRADE GROWS

DETROIT, Aug. 30—Canadian Tool Salvage Co. has been organized in Windsor, Ont., to operate as a branch of the National Grinding Co. of this city. The company specializes in the reclaiming of worn down cutting tools used in the automotive industry. The Detroit company has been in operation over a year and is extending its facilities to meet increased business demands. Affiliated in the company are H. M. Ash, W. G. Cook, H. W. St. John and A. J. Moquin.

# Motor Cars Used on 30.7% of U.S. Farms

## Survey Also Shows Truck Popularity

Per Cent Has Increased Since  
Census Taken 18 Months Ago  
Big Gain Since

WASHINGTON, Aug. 30—Statistics compiled by the Bureau of the Census, Department of Commerce, as of Jan. 1, 1920, show that 30.7 per cent of farms in the United States have automobiles. The data proves the utility of the motor vehicle, for it shows that of the 1,979,564 farms reporting there were 2,146,512 automobiles in use Jan. 1, 1920, or 332.9 automobiles per 1000 farms.

The Federal figures also show the growing popularity of motor trucks and tractors on farms. About two farms out of every hundred in the United States as a whole possess motor trucks. Motor trucks were reported on 131,551 farms in 1920, making a total of 139,169 trucks in use on that date. Pennsylvania led the field with 9372 motor trucks in use on farms; New York, with 9259; Iowa, with 8910; Ohio, with 7319; Nebraska, with 6548; California, with 6416, and Illinois with 6154.

Automobiles were reported by more than one-half of the farms in eight states, namely, Nebraska, Iowa, South Dakota, Kansas, Minnesota, North Dakota, California and Illinois.

The following States reported more than 100,000 automobiles on farms in 1920: Iowa, 177,558; Illinois, 139,090; Ohio, 128,384; Kansas, 111,055; Minnesota, 107,824; Texas, 105,292; Nebraska, 104,453, and Indiana, 102,122.

### Figures Over Year Old

It must be remembered that these statistics were gathered as of Jan. 1, 1920, and more than 18 months have elapsed since the compilation. Therefore, the data cannot be considered as indicative of present conditions, for enterprising salesmen have conducted active campaigns in this period and as a consequence thousands of machines have been added to farm equipment. Neither can the figures be regarded as comprehensive, because they are passed on only 30.7 per cent of all farms, and as reports have not been received from an impressive majority the figures cannot be used in any accurate determination of motor vehicle sales.

The record of the Bureau of the Census shows that one farm out of every 28 owns a tractor as of Jan. 1, 1920. There were 246,139 tractors in use on 229,334 farms on the census date. More tractors were in use in Illinois than in any other State, as statistics show 23,102 tractors in that State, with Iowa next,

possessing 20,270 tractors; Kansas, 17,177; Minnesota, 15,503; California, 13,852; North Dakota, 13,006; South Dakota, 12,939, and Nebraska, 11,106. These eight States reported more than one-half of all tractors on farms in the United States. For the country as a whole, there were 38.2 tractors for every 1000 farms in 1920, and for the eight States above mentioned, taken together, 106.8 tractors for every 1000 farms.

The States with the highest percentage of all farms reporting tractors in 1920 were as follows: South Dakota, 16.3 per cent; North Dakota, 15.2 per cent; Montana, 12 per cent; California, 10.3 per cent; Kansas, 9.8 per cent; Illinois, 9.3 per cent; Iowa, 9.1 per cent.

## Withdraw Ten Headlight Devices from State Law

BRIDGEPORT, CONN., Aug. 30—Withdrawal of ten headlight devices from the Connecticut-approved list, under the authority granted at the last session of the legislature, was announced recently by the motor vehicle department at Hartford and through its representatives here. The devices placed under official ban by this latest ruling, effective Jan. 1, 1922, are: Ford Green Visor, Nevablind, Mac Ne Glare Bulb, Raydex (type B), Onlee, Full Ray, Deflector, Safetee, Roadlight, Dimmre, Homemade Device. The Warner Pathfinder, Dillon (old type) Morelight, Clamert (old type) with frosted glass front and plain glass fronts with frosted bulbs are listed as illegal devices, "which are not approved and can not be used in this State."

Announcement is also contained in a comprehensive booklet on "Regulations Governing the Use of Headlights on Motor Vehicles," which has been prepared by the motor vehicle department for general distribution. Only advance copies have yet been given out.

## Mohler Heads Motor Division of Chamber

MEXICO CITY, Aug. 17 (*By Mail*)—A. B. Mohler, of Mohler y DeGress, has been named chairman of the new Automotive Division of the American Chamber of Commerce here. The chamber reports that the division is progressing rapidly and that definite results for the automotive industries should be expected from it. Chairman Mohler's firm is the Mexico City agent for Overland, Willys-Knight, Chalmers and Cadillac cars. The chamber reports that the total value of automobiles and parts bought by Mexico, as shown by the Governmental statistics, from the United States were valued at 15,162,266 pesos for the fiscal year ending June 30.

## Denby Refinancing Plan Agreed Upon

President Says New Capital Will  
Place Company in Good  
Position

DETROIT, Aug. 30—Stockholders of the Denby Motor Truck Co. agreed yesterday to the refinancing program outlined by directors, by which \$300,000 first mortgage bonds and \$650,000 first preferred stock will be issued to meet current liabilities and to provide working capital. The new stock issue will bring the company's capitalization to \$1,400,000. None of the stock will be offered at public sale.

In a statement to stockholders, 85 per cent of whom were represented at the meeting, President A. S. More said the new capital would place the company in an advantageous position to seek new business. Operations at the factory will be increased in September to meet demand for the ¾-ton and 1½-ton models.

The \$300,000 first mortgage bonds are five-year 7 per cent, \$100,000 Class A and \$200,000 Class B. The new stock is 8 per cent non-accumulative, par \$10. All of the new stock and bonds, except for the \$100,000 Class A bonds, will be used to meet creditors' claims, the stockholders waiving their rights to subscribe to the new issue.

## General Motors Export Back in Old Quarters

NEW YORK, Aug. 29—General offices of the General Motors Export Corp., which has been for some months at 120 West Forty-second Street, will be moved within the next few days to the former location in the General Motors Building at Fifty-seventh Street and Broadway. Four floors of this building, it was stated, have been vacated by the Chevrolet group of General Motors, thus leaving free the space for use of the export company. The export company reported, coincident with the announcement of the removal, that foreign sales were showing somewhat of an increase and that a good volume of business was expected not later than the beginning of the new year.

### DUESENBERG IS BUSY

INDIANAPOLIS, IND., Aug. 30—The Duesenberg Automobile and Motor Co., Inc., has progressed so far with its plans that it is about ready to close contracts with some distributors in the metropolitan territory. The price of the Straight Eight has not yet been definitely fixed, but it is understood that it will be around \$6,000.

## Ford's Power Plant May Be Abolished

Engineers Consider Transforming  
It Into All-Steam Plant—  
Seeking Economic Remedy

DETROIT, Aug. 30—The enormous power plant at the Ford Highland Park factory, long the pride of Henry Ford, is soon to be transformed from a gas-steam plant to an all steam plant, or is to be abolished entirely, Engineers, headed by William B. Mayo, are now determining the most economic method of handling the power situation.

The gas-steam plant has been in operation for over ten years and a point has been reached where gas-steam power is no longer as economical as steam power alone.

Two plans are under consideration. The first involves the junking of the producing gas plant and installation of additional steam boilers. This would cost approximately \$2,000,000. The second plan is to eliminate the Highland Park power plant entirely and bring high tension power from the River Rouge, which would require an addition to the latter plant. This cost approximates \$3,000,000.

There will be no interference with operations at the Highland Park plant while the power changes are under way. The Detroit Edison Co., which has a power house nearby, would furnish 90 per cent of the present peak power, which runs about 75,000 hp.

## Detroit Trailer Has New Heavy Duty Model

DETROIT, Aug. 30—Detroit Trailer Co. has brought out a heavy duty semi-trailer capable of carrying a load of 50 tons, which it is now preparing to go into production. The semi-trailer was given a thorough trial last week and found fully practicable for the work designed. Several orders for first production were placed following the trial.

The semi-trailer departs from the conventional in that it has four wheels in line instead of two. This gives it a total tire surface of 48 in. and permits a load disposition of about 800 lb. per sq. in. Each of the four wheels are mounted on special Mansfield axles with radius rods on ball joints. Double spring action is provided.

Specifications of the semi-trailer, in addition to Mansfield axles and steel frames, call for Timken bearings and Detroit springs. List price has been fixed at \$2,750 and the company regards the field for the new vehicle as unlimited. Through the use of the four wheels to carry the load, the trailer overcomes overloading legislation.

The new trailer was designed by J. B. Mansfield, president of the company, and patents covering all features have been applied for.

## REPUBLIC OF BRAZIL PLACES TRAILER ORDER WITH DETROIT FIRM

DETROIT, Aug. 29—An order for fifty 5-ton trailers with combination steel and wood bodies has been received by the Detroit Trailer Co. from the Republic of Brazil for instant delivery. In addition, the company has received an order for 47 bodies for G. M. C. trucks, the latter order also for the Brazilian Government, being placed with General Motors, specifying Detroit bodies. The trucks and trailers are to be used for hauling cement into the interior, a distance of 250 miles.

The order is said to be the largest export order received in Detroit for some time, and is the largest trailer order of the year. Outlook in the trailer business is considered promising.

## Seiberling Is Silent on Republic Rumors

AKRON, OHIO, Aug. 30—F. A. Seiberling, former Goodyear president, today said he had nothing to give out for publication upon his reported negotiations with C. H. Booth, receiver of the Republic Tire & Rubber Co. at Youngstown for rumored acquisition of the Republic plant.

It has been reported for some time that Seiberling planned acquisition of the Republic plant and the Marion Tire & Rubber Co. of Marion, Ohio, which with the Lehigh Tire & Rubber Co. of New Castle, Pa., and the Star Rubber Co. of Akron, would form the nucleus of a chain of rubber companies. Seiberling has assumed control of the Lehigh plant and it is now in operation. He has a large interest in the Star at Akron.

It is also reported that Seiberling interests will bid in the Marion plant if it is sold at receiver's sale on Oct. 3, as now scheduled by D. D. Grindle of Lima, referee in bankruptcy. Akron men are prepared, however, to meet with creditors and stockholders before the date of sale and offer them a plan whereby the company's bankruptcy can be relieved and high priced inventories utilized without heavy loss. Claims against the company now aggregate \$600,000.

## SEVERNS KNOX RECEIVER

MT. VERNON, OHIO, Aug. 30—F. W. Severns, former county treasurer, has been appointed receiver for the Knox Tire & Rubber Co. The petition for a receivership was filed by Edward Elford who claimed to have a mechanic's lien on the property for \$6,754. Severns will continue operation of the plant under the direction of the court.

The plant has been running and will continue with possibly more men.

## Defer Payments of Miller Dividends

Rubber Company Will Issue No  
Preferred Stock Checks  
September 1

AKRON, OHIO, Aug. 30—Miller Rubber Co. officials have announced that their preferred stock dividend due Sept. 1 would not be declared owing to a present book deficit. Owing to the uncertainty of business conditions officials of the company also say it will be impossible to indicate when payment of dividends can be resumed, advising that this will depend entirely upon the amount of business that can be secured at prevailing prices.

Since Jan. 1 the Miller Rubber has reduced its inventory sufficiently to reflect a reduction in total indebtedness from \$8,676,000 to \$2,400,000, of which \$1,400,000 is owing to banks, according to a letter just issued to stockholders. Against this the company has accounts receivable of approximately \$3,100,000 and \$1,200,000 cash in banks. Neither of the indebtedness figures accounts for commitment losses, which have been reduced about \$400,000, it is stated.

During the first five months of the current year Miller business was 55 per cent of the corresponding period of last year, but since June 1 business has revived, officials claim, and now averages 82 per cent of the corresponding period of last year, at reduced prices.

"In accordance with the requirements of the preferred stock contract, the directors contemplate purchasing in the open market, so far as is deemed advisable, the amount of stock which the company is required to redeem during the current year. Funds for this purpose can be taken from the assets of the company independent of a surplus account. In fact, such action will hasten the accumulation of a surplus, from which alone dividends can be paid," states William F. Pfeiffer, secretary and treasurer of the company.

## Allis-Chalmers Gets \$200,000 Ford Order

MILWAUKEE, WIS., Aug. 29—The Allis-Chalmers Mfg. Co., Milwaukee, has booked a contract from the Ford Motor Co. to furnish and install four turbine type electro-generators with an aggregate output of 8000 hp., in the new tractor plant which is being established at Troy, N. Y., on the banks of the Hudson. The contract is valued at \$200,000. This is the second big contract for machinery placed by Ford with Allis-Chalmers. The first was to equip the large new saw and planing mills of the Michigan Land, Lumber & Iron Co., division of the Ford Motor Co., at Iron Mountain, Mich. The mills are now in operation and are producing virtually all of the lumber and stock required for Ford bodies, wheels and chassis woodwork.

## Seek Reduction on Motorcycle Duty

### Manufacturers Also Request Separate Classification—Many in Protest

WASHINGTON, Aug. 30—Representative motorcycle manufacturers have appeared before Senate Finance Committee to request a separate classification in paragraph 371 of tariff bill instead of being placed with bicycles, parts, etc. They also asked that the 30 per cent duty provided in House bill on motorcycles be reduced to 15 per cent.

Walter Davidson of Milwaukee, representing the Harley Davidson people, asked for a reduced rate, saying their object is to build up domestic production by preventing foreign makers from placing high rates against American motorcycles. He said there are scarcely any imported motorcycles for use in this country and figured that within a short time his company's exports would be two-fifths of its output.

William G. McCann of Springfield, Mass., representing the Hendee Mfg. Co., asked for reduced rates. He said England, Belgium, Australia, Spain and Italy had placed duties on motorcycles which amounted to an embargo on motorcycles, but Spain has lower rates, so this import market would be open to American producers. McCann said England is the only maker of motorcycles comparable in quality with American machines and that domestic makers here invite importations from Great Britain to aid in expense of development of motorcycle industry. It was his contention that American motorcycle makers have succeeded in having a number of countries reduce tariffs and expects to get further reduction from the countries and concessions from countries which are now holding out.

L. B. Fauber of Elyria, Ohio, representing Troxel Mfg. Co., did not approve of the reductions, but said they should not be lowered from House rates. He declared in favor of 45 per cent duty.

### Parker Motor to Make New Car in Montreal

DETROIT, Aug. 29—Parker Motor Car Co., Ltd., has been formed in Montreal to manufacture the Parker car, a 6-cylinder assembled vehicle, with a new adaptation of spring suspension designed by Wright-Fisher Engineering Co., this city, to meet special road conditions in Canada. The company is capitalized at \$10,000,000.

Production plans are being hurried through so that cars may be available at the time of the Montreal show. It is expected to build about 4000 cars a year and the price on the open models will not exceed \$3,000. The company plans to buy at least 65 per cent of its parts in Canada.

### PACKARD GIVES EMPLOYEES TWO WEEKS' VACATION; SOME WITH PAY

DETROIT, Aug. 29—Packard Motor Car Co., in compliance with a manufacturing plan formed early in the season, has closed for a two weeks' period to give its employees a two weeks' vacation. The factory will reopen on Sept. 10 on its regular manufacturing schedule.

Employees who have been with the company ten years are receiving full pay for the vacation period, those five years with the company are receiving half pay. Between 500 and 600 men will be kept at work to turn out rush orders, those entitled to vacations receiving double compensation.

### Royal Rex Truck Has New Shipment Scheme

CHICAGO, Aug. 30—The Royal Rex Motors Co., Chicago, building motor trucks and motor buses, is featuring a new departure in truck shipments between the factory and dealers. The outstanding feature is the shipment of trucks in boxes and cases instead of total units. By the use of this method the transportation charges are very materially reduced and the shipments are arranged and packed in such a way that the truck can be assembled at the point of destination with a minimum amount of time and labor.

Aside from the shipping features of the trucks, there are several other up-to-date features. The chassis are in 1, 1½, 2, 2½, 3½ and 5 ton capacity. The intake air purifier for the purpose of eliminating dust is one of the engineering points. The frame is assembled without rivets, has no holes in the top web of the side rails and has a sub-frame of wood. The engine is supported in a steel cradle which in turn has a three-point suspension.

### Perron Forms Company to Market Invention

SPARTA, WIS., Aug. 29—A. J. Perron, founder and president of the Perron Spark Plug Co., Sparta, Wis., organized two years ago, has formed a new corporation to manufacture and market another of his important inventions, consisting of a vacuum traffic signal for passenger and commercial cars. It is known as the Perron Signal Co., and its officers are: President and general manager, A. J. Perron; vice-president and secretary, John W. Jones; second vice-president, M. Reisinger; treasurer, S. A. Steel. The Perron Signal will be put into production at once. Patents were applied for April 2. The signal is placed on the front and rear of vehicles and consists of right, left and stop arms, which are operated by a steering wheel control deriving power from the manifold.

## Money Market Eases in Indiana District

### Receiver at One Indianapolis Manufacturing Plant Will Be Discharged Soon

INDIANAPOLIS, IND., Aug. 30—Considerable easement in the money market has been noted throughout Indiana in the last thirty days, and this week two especially significant stories came to the ears of automobile men, creating considerable interest.

One of the local motor car manufacturers has been in the hands of a receiver. The receivership soon will be discharged, it is expected. This, too, came as surprising, for the speed with which this company has readjusted has been unusual. The chief executive of the company, by telephone on Wednesday, was offered \$125,000 which the person making the inquiry said "would be available soon."

Now, that much money six weeks ago or so would have seemed impossible of obtaining in Indiana. To top off that story is the second, which came from the official of an Indianapolis bank which has been handling motor vehicle paper.

"Right now we can use \$50,000 worth of automobile paper," he said. The fiscal year of the company is just closing. Its record will show one loss of \$1,500. This came because of the forced repossession of a big stock of automobiles. An opportunity came to dispose of them quickly at a price \$1,500 less than the bank's equity. Credits have been "frozen" so long in Indiana that these "thaws" create no little comment.

### Ford Planing Mills Now Shipping to Main Plant

MILWAUKEE, WIS., Aug. 29—The new saw and planing mills at Iron Mountain, Mich., owned and operated by the Ford interests under the name of Michigan Land, Lumber & Iron Co., are now making regular shipments to the main Ford plant at Detroit, and as production increases, distribution to branch plants will be effected. The mills were formally opened with due ceremony early in July. All of the machinery and equipment is of special design to suit requirements of the Ford plants, principally for body stock, other woodwork and crating and box material.

Shipments are being made by rail from Iron Mountain to Menominee, Mich., where the carlots are picked up by Ann Arbor carferries and go by lake to Reed City, Mich., where the main dry kilns of the Ford organization are situated. After treatment, the lumber is transferred to Detroit. To feed the new Iron Mountain mills, the Ford company has recently let contracts for 2,000,000 feet of logs, principally hardwoods, to Upper Michigan timber and logging jobbers. Deliveries to Iron Mountain have already begun.

## \$4,875,223 Deficit for Rubber Company

### President Seger of U. S. Explains Statement for First Half of Year

NEW YORK, Aug. 30—C. B. Seger, president of the United States Rubber Co., is sending to the stockholders a statement relative to the operation and results for the first six months of the calendar year 1921.

After explaining that "in ascertaining the result for the first six months of 1921, the cost of goods sold was computed on the basis of the cost of goods carried in inventory as of the first of the year, plus the cost of goods manufactured during the period, thus absorbing in cost any depreciation that may have occurred in inventory after the first of the year and also the higher cost of goods manufactured during the period," he says that "computed in the manner hereinbefore explained, the results for the first six months of 1921 show a deficit of \$4,875,223 after all interest and other charges." Continuing, Mr. Seger said:

#### Seger's Statement

"Against this the company has reserves, heretofore created out of income to cover contingencies that might arise, sufficient to offset this deficit, but it is deemed proper to report the actual results as stated above and await the realization of the results for the last six months of the year, which we hope and believe will show substantial improvements, due largely to the liquidation of stocks effected during the first six months and the lower cost of manufacturing during the last six months of the year, which will result from the reduction in price of basic raw materials, wages, and reduction of overhead made possible by increase in volume of production.

"It should be borne in mind that if the reductions in selling prices and other disadvantages referred to could have been anticipated they could have been provided for by appropriation of corporate surplus, applied to the further writing down of inventories as of Dec. 31, 1920, in which event the final net results would be the same as will result from absorbing in the operations of 1921 the amount of shrinkage resulting from these conditions."

#### Seasonal Conditions

In his circular to the stockholders Mr. Seger further explained the position of the company as follows:

"The business of this company, by reason of the major of the commodities handled, is subject to seasonal conditions and is necessarily conducted and must be considered on a yearly basis. Therefore, the results for any period of the year are not conclusive and might readily be misleading unless consideration is given to the condition under which the results were produced.

"The business recession that started during the last half of 1920 continued during the first half of 1921, with some improvement, however, in the latter part of that period. In order to meet this situation and conserve cash resources to the greatest possible extent, manufacturing operations were curtailed to the minimum consistent with actual requirements. This resulted in increasing the cost of production, due principally to absorbing those elements of overhead expenses which could not be eliminated.

"The cost of finished goods carried over as of the first of the year was conservative on the basis of the selling prices then prevailing, which prices it was believed would be maintained for the period of time necessary to effect the liquidation of stocks. Instead, however, it was found necessary to substantially reduce selling prices for some classes of merchandise, especially tires and mechanical

goods. The effect of these price reductions was necessarily reflected in the results of sales for the first six months of this year in addition to which there was reflected in the net results for the period the burden of the higher cost of goods sold, as shown above. "In addition to the effect of the reduction in sales prices and the higher manufacturing costs, consideration should be given to the matter of selling expenses. Owing to the seasonal nature of a large proportion of our business, the benefits of the sales efforts necessarily made during the first six months of the year will be favorably reflected, to a considerable extent, in the sales and profits for the last six months of the year, whereas the expenses are taken into account and charged against the income of the first six months, being the period during which they were incurred.

"As the result of this procedure selling expenses for the first six months of 1921, charged to the income account for that period, include a substantial sum representing the sales effort, the benefits of which will accrue in the last six months of the year and, in some cases, subsequently."

#### SEGER TO BE CHAIRMAN

NEW YORK, Sept. 2—C. B. Seger, president of the United States Rubber Co., will be elected chairman of the board when the directors meet next month, according to reports circulated in the financial district yesterday. Mr. Seger also is expected to retain the position of president. First reports had it that he would be made chairman of the board, to succeed the late Colonel Colt, and that a man not connected with the company would be elected president.

### Detroit May Be Scene of Big Gas Cut Fight

DETROIT, Aug. 30—Detroit may become the center of one of the biggest gas-cut wars. The local gasoline sellers, whether just filling stations, garages or other places which sell gasoline to automobilists, have been fighting for a 2-cent margin of profit a gallon. All the refineries except the Standard Oil Co. have given in to the dealers. Recently the latter formed the Retail Gas and Accessories Dealers Association, and President H. C. Maule has declared that every possible effort will be made to get the Standard to agree to the 2-cent margin, and if the request is not granted, it is said that the dealers will refuse to handle Standard oil and other Standard products.

The curious side of the matter is, according to an official of the dealers' association, that the Standard company is allowing gas dealers a margin of 2 cents a gallon in practically every State but Michigan. At present, Standard gas is retailing at 18.9 cents, leaving only 1 cent profit to the dealer. Independents are charging 19.9 cents and the retailers' margin is 2 cents a gallon. It is said by some dealers that they favor a price-cut war to a finish, as it is a case of Standard against everybody else.

#### COAST HIGHWAY OPENED

SAN FRANCISCO, Aug. 30—The new Santa Cruz highway, connecting that city with San Francisco, was officially opened Aug. 26 by a parade of more than 200 automobiles from San Francisco. The San Francisco Motor Car Dealers Association officially opened the road and was the guest of honor at the ceremonies.

## Low Prices Feature Toronto Motor Show

### Many Model Changes Also Noted at Opening of National Exhibition

TORONTO, Aug. 27—Downward revision of Canadian car prices and many model changes were the outstanding features of the motor car show in the Canadian National Exhibit, which was opened here to-night by General Sir Julian Byng, of British tank fame, and Canada's new Governor General.

The exhibition slogan is "Business Is Good," and almost without exception business representatives attending declare that business is better than anticipated and that they look for a gradual improvement in conditions, reaching a peak in 1922.

#### All Makes Represented

Forty-seven car manufacturers and about thirty truck makers, mostly American, are represented. Particularly strong popular attention is being attracted by the new Durant car which was introduced in person by W. C. Durant, who spent the day talking with the trade and the public at his booth. Durant showed a green touring model. While the Canadian price has not been fixed, Durant said it would be "less than \$1,300." Willys-Overland, Ltd., has a special Overland Four in the show with a composite body and a new series Reo also is shown. Austin, Vauxhall and Fiat are the only foreign cars shown. The London Six, made in London, Ont., is a new Canadian product on exhibition.

The automotive equipment show is the largest and most representative held in the Dominion. Sixty-seven exhibits of practically all leading Canadian automotive equipment manufacturers and jobbers are shown. A great collection of war photographs helps to attract many to the automotive equipment exhibit.

There are a score or more of tractors displayed and some motor boats and motor cycles.

### Myers, Colt's Counsel, Dies After Operation

NEW YORK, Aug. 30—Nathaniel Myers, for many years personal counsel to the late Colonel Samuel P. Colt, chairman of the board of the United States Rubber Co., died early yesterday morning in the Lenox Hill Hospital of this city following an operation a few days ago in his seventy-fifth year.

#### GREYHOUND INCORPORATES

OTTAWA, ONT., Aug. 30—The Greyhound Motor Corp., Ltd., has been incorporated with a capital of \$250,000. Head office, Montreal. L. C. Davis of Providence, R. I., and four Montreal directors are named in the Canada Gazette notice.

## Peru Holds Its First Automotive Exhibit

**Proves Most Extensive Feature of  
Independence Centenary—  
Trade There Heartened**

LIMA, PERU, July 31 (*By Mail*)—The display of automobiles and automotive equipment, including trucks and tractors, was the most extensive and most attractive of the exhibits at the Industrial Exhibition held in connection with the celebration of the Centenary of Peruvian Independence. This exhibition has just gotten under way and will continue for some weeks.

The display is the first attempt at an automotive exhibition or show ever held in Peru. Taking into consideration that Peru has been suffering from a severe industrial depression, both Peruvian representatives and foreign manufacturers should feel greatly heartened by the industrial exhibition.

### U. S. Far in the Lead

The exhibits showed the products of the United States, Great Britain, France, Italy and Germany, with the North American manufacturers far in the lead. The exhibit of El Vulcano—the Vulcan Iron Works of Lima and Callao—was conspicuous. This firm, which has large machine shops on the outskirts of Callao, is the agent for Marmon, Studebaker and Citroen cars; Mack trucks, Troy trailers, the Wallis, Yuba and Cletrac tractors, as well as Polack tires and other kindred lines. All of these cars, trucks and tractors were shown on the floor of the display room.

Delancy McKay & Co., a representative American house, made display of the Buick car, for which they are the sole agents for Peru. The National passenger cars, as well as Firestone tires, were also shown by this company. Fort Hnos, the Chandler representatives, naturally had their line on exhibition, and A. C. Shumway & Co., the Ford agents, who have recently greatly enlarged their dealer representation throughout all parts of Peru, showed the complete Ford line. This was accompanied by an announcement which stated the company had sold 600 Ford trucks, 700 Fordson tractors and 1400 Ford cars in Peru.

### All Models Displayed

Wessel, Duval & Co., who have the agency for Cadillac, Haynes, Franklin, Chevrolet, F.W.D. trucks, Avery tractors and Miller tires, displayed a Cadillac touring car, an Avery tractor and Miller tires. Bergstrand displayed Harley-Davidson motorcycles.

The exhibit of Ferrand Hnos marks the transition from American to European products. This company is divided, displaying United States trucks, Indian motorcycles on the one hand and English Dunlop tires and English Austin tractors on the other. Tassarò Bosso & Co. also carry water on both shoulders, displaying the Lancia from Italy, in both touring

and limousine styles; Rudge-Whitworth motorcycles from England and Federal tires from the United States.

The firm of G. M. & A. Petitjean had the French Berliet car which they are just introducing, and the well known Peruvian firm, W. & J. Lockett, showed the English Wolseley. Reiser Curioni & Co. made an extensive exhibit of Fiat cars, both limousine and touring, as well as trucks and tractors of the same make. They also showed Pirelli tires of Italian manufacture.

### German Tire There

It is noteworthy that the steel faced, leather-tread pneumatic tire was exhibited by the European representatives. At the present, the metal stud tire is a rarity in Lima.

Last, but not least, in future potentiality was the display of Gildemeister & Co., of the German Continental pneumatic tires. This is the first time since the war that this tire has appeared in Peru. It is in inch as well as in metric sizes and of a scalloped tread rather than the ante-bellum ribbed tread. Gildemeister also exhibited a Hansa Lloyd tractor, which appeared to even a superficial observer like a converted tank.

The European automobile representatives played up the low gasoline consumption of their vehicles.

Taken as a whole, the American product, from cars to lubricating oils, held its own well in the display room. American cars running about the streets of Lima outnumbered European about 50 to 1.

## New Adria, \$1,500, to Be Built at Batavia, N. Y.

NEW YORK, Aug. 30—The Adria, a new car to sell at \$1,500, will move to a new factory in Batavia, N. Y., early in September. It is planned to make a reasonable number of cars this fall and to start production on a larger scale during the winter to be ready for spring buying.

One of the features of the car is the rear axle, which has no axle housing. Its place is taken by a light axle formed of three pieces bolted together as a single unit, this carrying shackles for the springs and spindles for the wheels. This reduces the unsprung weight almost to a minimum, as the pieces are of seamless steel tubing. Specifications include Supreme engine, 3½ x 5, Delco ignition, Bijur starting and lighting, Borg & Beck clutch and Gemmer steering gear. Wheelbase is 120 in., tires 33 x 4.

## 800 on Durant Payroll at the Muncie Factory

INDIANAPOLIS, Aug. 30—Between 700 and 800 men will be on the payroll of the Durant Motor Co. at Muncie by Jan. 1, according to Dennis A. Burke, president and general manager of the concern, and the Muncie Durant plant will be in production before that date. The Durant company recently bought the Sheridan Motor Co.'s plant in Muncie.

## Cincinnati Plans Accessory Exhibit

**Manufacturers and Allied Inter-  
ests to Participate in Show  
This November**

CINCINNATI, OHIO, Aug. 30—John Behle, manager of the Cincinnati Automotive Trades Association, is planning a fall automotive accessory and equipment exposition, to be held at Music Hall, this city, one week in November, in which all local automotive merchants, manufacturers and allied interests are expected to participate.

In a letter sent out to the members of the association recently the idea of the exhibit was outlined, and returns from these letters indicate that the members are very favorable to the exhibit, which is a new idea for this city.

A similar exhibit was given last December in connection with the Ohio State automobile show held here. It far exceeded the expectations of those who had charge of it, and only about half as much space was provided as could have been used. The success of this venture is the foundation upon which the accessory show is being planned.

Last year the exhibit was made up of manufacturers who were showing their products chiefly to the dealers. This year the dealers and manufacturers will show their products for the benefit of the individual owners of cars and trucks. It will comprise everything in the line of accessories, equipment, supplies and repair parts.

"There is every reason why it should be a success," said Mr. Biehle in discussing the proposed show. "Owners of automobiles have only a slight first-hand knowledge of most of the accessories that are made for their cars. This show will be a good place for them to see and learn about these things. Also, it will give the dealers and manufacturers an opportunity to place their products before the ultimate consumers."

The show will be open to Cincinnati dealers and all manufacturers who distribute their products through jobbers and retailers. Both dealers and manufacturers will be solicited to create interest in the show.

In addition to the exhibits there will be daily educational lectures and demonstrations for the motorist, also attractive entertainments.

## Dedication of Coast Road Draws 1500 Crowd

SAN FRANCISCO, Aug. 30—Approximately 1500 persons attended the dedication of the new Franklin canyon highway, between Martinez and Pinole. The road, which is of crushed rock foundation with a five-inch concrete surface, 20 feet wide, cost \$800,000, and was constructed by Mrs. Ellen O'Brien, widow of a contractor of Martinez.

## Birmingham Motors Formed in New York

### Will Build New Type Automobile to Be Made Without Axles

DETROIT, Aug. 29—Birmingham Motors, a trust, has been organized at Jamestown, N. Y., to build a new type of automobile, which will be constructed without axles, the drive being by spindles, and the frame suspension being entirely upon cross-built springs. It is claimed for the car that the only unsprung weight is the wheels. Production is looked for about the opening of the 1922 show season.

The car is the idea of C. E. Weaver, who has been connected with the industry since its early days, serving first with Franklin and latterly being instructor in mechanical branches at the University of America, Washington. Engineering work and perfection of the design was handled by the Wright-Fisher Engineering Co., this city.

#### Basic Patents Purchased

The Birmingham is declared by Weaver to depart from all previous construction ideas, except for the design of the Cornelian car which was built by Blood Bros., several years ago, at their Allegan, Mich., plant. All patents held by Blood Bros. have been purchased by Birmingham Motors, and in addition patents have been applied for on improvements.

Aside from the special spring construction, the car will be made of standard units, including 6-cylinder Continental engine, Stromberg carbureter, Bijur starting and lighting, Gemmer steering gear, Borg & Beck clutch, Exide battery, Detroit gearset, Timken bearings, Michelin disk wheels; wheelbase will be 124 in.

### G. M. C. Truck Production Between 15 to 20 a Day

DETROIT, Aug. 30—General Motors Truck Co. at Pontiac is producing between 15 and 20 trucks a day and unfilled orders are larger than at any time since March. Increased business is attributed to recent price reductions.

W. L. Day, president, says in part: "We are building trucks from material bought at peak prices and while we are not making anything on the trucks at the new prices, we believe that we must accept our losses as do others. I am confident that September, October and part of November will be a good business period, and December and January probably will be dull."

### Olds Passenger Cars and Trucks Reduced

NEW YORK, Aug. 30—The Olds Motor Works announces that the following new prices for Oldsmobile passenger cars and trucks are effective Monday, Aug. 29:

43-A, 4 cylinder car:	Old	New
Touring .....	\$1,345	\$1,145
Roadster .....	1,325	1,145
Coupe .....	1,895	1,645
Sedan, 5 passenger .....	2,100	1,845
Small 8, No. 47:		
Touring .....	1,725	1,625
Coupe .....	2,225	2,185
Sedan, 5 passenger .....	2,425	2,425
Large 8, No. 46:		
Touring, 7 passenger .....	1,875	1,735
Pacemaker, 4 passenger .....	1,825	1,735
Sedan, 7 passenger .....	2,775	2,635
Truck:		
Chassis .....	1,250	1,095
Chassis with cab .....	1,325	1,175
Chassis with express body and top .....	1,395	1,245

### Mercer Motors Cuts Price on All Models

TRENTON, N. J., Aug. 30—Mercer Motors Co. announces price cuts on all models. The new prices follow—Sport-about, touring, runabout and raceabout, \$3,950; touring, limousine, \$5,650; coupe, \$5,150.

In explaining this price change, the new management, which recently took over Mercer affairs, state that it is made largely possible by the savings effected through the operation of the company's affairs entirely at the factory instead of through Hare's Motors, as formerly.

It will be recalled that Mercer prices were increased by Hare's Motors last March, and this reduction carries the list back to where it was prior to the increase.

### Stevens-Duryea Cuts Four of Its Models

NEW YORK, Aug. 30—Stevens-Duryea, Inc., has announced a price cut on the following models:

Name of Car	Old Price	New Price
Two passenger .....	\$8,500	\$7,250
Four passenger .....	8,000	6,900
Seven passenger .....	8,000	6,800
Sedan, four passenger .....	9,500	9,000

#### PEERLESS CARS CUT

DETROIT, Aug. 30—Peerless Motor Car Co. of Cleveland has reduced prices \$100 to \$180.

	Old Price	New Price
Touring .....	\$2,990	\$2,880
Roadster .....	2,990	2,880
Coupe .....	3,600	3,500
Sedan .....	3,950	3,790

#### ROAMER MAKES CUTS

NEW YORK, Aug. 31—The Roamer Motor Car Co. has announced a second reduction in all its models:

	Old	New
4 passenger sport .....	\$3,150	\$2,650
2 passenger roadster .....	3,150	2,750
7 passenger touring .....	3,250	2,750
4 passenger coupe .....	3,985	3,850
5 passenger sedan .....	4,100	3,950

#### ASK IMPORT STAMP

OTTAWA, ONT., Aug. 30—An order-in-council has been passed changing the date after which all goods imported into Canada must bear the name of the country of origin, as required under the new custom regulations, from Oct. 1 to Dec. 31, 1921. This alteration has been made to allow ample time for the importers.

## Coast Automotive Men in Convention

### Northern Division Hold Annual Meeting—Enthusiasm Among the Delegates

SAN FRANCISCO, CAL., Aug. 30—The northern division of the California Automobile Association held its semi-annual meeting at Al Tahoe, on the shores of Lake Tahoe, in the high Sierras, Aug. 20 and 21. More than 100 delegates from all sections of the state north of the Tehachepi mountains were in attendance, and there was more enthusiasm among the delegates than noted at previous meetings. George Habermeyer, state president, occupied the chair throughout the meeting. The report of Robert W. Martland, secretary manager, showed the association to be in good financial condition and to be growing steadily and rapidly.

#### Co-operative Buying

The principal discussion of the convention centered on the co-operative buying projects that are springing up continually in all parts of California. It was shown that some of the less well-known firms are offering large discounts to get business. This was disapproved, and the automobile tradesmen were shown clearly that giving discounts where they are unwarranted, or in larger amount than good business acumen would dictate, will soon wreck the retail business, either in automobiles or in equipment for them. It was demonstrated to the delegates that the margin of profit is so small now that those in the business will "go into the discard if they do not get full profits." Costs of doing business in these lines were shown by figures.

#### Craft Discussions

The first day of the convention was given over to craft discussions, the association being divided into various crafts, so that all the men in the same line of business meet together and thresh out their difficulties and air their problems. The second day was devoted to the general meeting, when reports of the crafts were read and general discussion given full time. Effects of price reductions on the dealers and on the trade in general were presented by various dealers. It was pointed out by L. H. Bennet, a commercial expert, that few garages in the state apply real selling methods to their businesses. Mr. Bennet demonstrated that a few dollars a day in extra sales would cover the overhead on every one of these garages for some time to come. Reports indicated that the failures among members of the association were some 60 per cent fewer in number than among those in the same lines outside the association.

The next semi-annual convention of the association will be held in February in San Jose, Cal., the exact date to be fixed later.

## Car's "Visible Value" Factor in Selling

### Briscoe Sales Chief Says Average Buyer Eliminates Cost in Purchase

SAN FRANCISCO, CAL., Aug. 30—The visible value of a car to-day is a greater factor in inducing the public to buy than are price reductions. This rather unusual view of the automobile selling situation is contained in a letter from Kelly R. Jacoby, vice-president in charge of sales of the Briscoe Motor Corp., just received by Frank O. Renstrom, Briscoe distributor here. Jacoby had just returned to the factory from a swing around the circle, in which he got first-hand information on the retail market for automotive vehicles in every State from the Canadian border to the Gulf of Mexico and from the factory westward to the Pacific Coast. His letter says, in part:

#### Car Buyer After Value

"The story is the same everywhere you go; the car buyer is after value. The tremendous confusion caused by many weeks of price reduction is now, happily, being dissipated. The automobile buyer is a pretty careful analyst; he no longer accepts everything told to him as gospel truth, that is to say, he accepts some, but he rejects much. He tries to strike an average of comparison and on that firm basis forms his opinion of the various makes of cars.

#### Reductions Trivial

"The average car buyer, at least those with experience, failed to enthuse over price reductions, for the simple reason that he felt that quality was being reduced with the price. In some cases, their suspicions may have been correct; in the majority it was not, but that does not alter the fact that the buyer and the prospective buyer to-day want value received for every dollar they put into an automobile."

## Chinese Airplane Gives Excellent Performance

WASHINGTON, Aug. 30—Several successful flights have been made with a hydro-airplane constructed by Chinese engineers at the Chinese Government Dock & Engineering Works at Foochow, according to a report made to the Bureau of Foreign and Domestic Commerce. All the material used in the construction of this plane, which was specially designed by a Chinese engineer, with the exception of the engine, which is of American design and manufacture, was produced in China. The works have several more of this type of airplane under construction for use by the Chinese navy. The success so far achieved is expected to give quite an impetus to aviation development in China.

## Southern "Town in Himself" Has Good Chance of Beating This Case—In Fact, He Can't Lose

ATLANTA, GA., Aug. 24—In a small town the automotive accessory dealer may just as well be the town preacher, postmaster, lawyer, etc.

In one of these towns just outside of Atlanta a few days ago a salesman with automotive specialties sold a fairly good sized order. When the goods arrived, however, the dealer found that they were of inferior quality and not nearly up to the standard as claimed by the salesman. Therefore he promptly returned them to the manufacturer. Shortly thereafter the house endeavored to force collection of the bill. First a sight draft was drawn on the dealer through the local bank, and was returned in a few days unhonored. The house then wrote the postmaster asking after the financial standing of the dealer, and was informed that he was o. k. By return mail the manufacturer wrote the postmaster asking him to secure an attorney for him and force collection of the bill. The manufacturer received the following reply:

"The undersigned is the dealer on whom you attempted to palm off your worthless specialties. The undersigned is also the president of the bank to which you sent your sight draft. Furthermore, the undersigned is the postmaster to whom you wrote, and the undersigned is also the attorney whose services you seek to force collection of this bill. Your methods are nefarious considering the inferior quality of the goods sent me and the extravagant claims made by your salesman. The undersigned is so angry that if he were not also the preacher of the church in this place he would be sorely tempted to tell you to go to h—."

## Detroit Preparing for Convention of M. A. M. A.

DETROIT, Aug. 29—C. W. Dickerson, vice-president of Timken-Detroit Axle Co., who is chairman in charge of Detroit arrangements for the "Back to Normal" credit convention of the Motor & Accessory Manufacturers' Association, has about completed plans for the reception and entertainment of delegates and guests. The two opening days of the convention, Sept. 14 and 15, will be given to business sessions with the dinner on the 14th evening.

The 16th will be a day of recreation at the Detroit Golf Club. Wives of delegates will be entertained during the sessions with sight-seeing trips about the city and lakes, and social events at the Detroit Boat Club and the Detroit Athletic Club. Edgar A. Guest will be the sole entertainer at the convention dinner.

Acting on the Detroit committee with Dickerson are E. T. Ailes, treasurer Detroit Steel Products Co.; M. A. Moynihan, secretary Gemmer Mfg. Co., William Hendrie, secretary Detroit Gear & Machine Co.; Thomas M. Simpson, credit manager Continental Motors Corp.

## Stockholders Against Automotive Receiver

TOLEDO, Aug. 30—Officers and directors of the Automotive Corp., tractor manufacturers, decided at a meeting of stockholders to fight to a finish the petition filed by E. E. Hallet, Archbold, Ohio, stockholder, asking for the appointment of a receiver for the company.

It was stated that stock sold to a brokerage house for \$14 had been sold at \$25 a share. The par value of the stock is \$15. Attorney Denman also declared that the company had valid contracts for \$2,250,000 worth of tractors but that production had been held at a low ebb by business depression's effect on demand.

## Pre-Selex Gear Shift Launched in Illinois

CHICAGO, Aug. 29—Pre-Selex Gear Shift Corp. has been organized in Illinois for the manufacture and sale of the Pre-Selex mechanical gear shift, which is designed to eliminate entirely the hand-shift lever and permit gear shifting through the clutch pedal. This shifting is accomplished without springs or electricity.

Ten leading automobile factories are preparing to test the Pre-Selex gear shift. Manufacturing plans are now under way.

The company's affairs are in the hands of Franklin A. Miller, vice-president, who has been associated with the industry for a number of years. He was at one time advertising and assistant sales manager of Stromberg Motor Devices Co. Executive offices of the company are at 750 Railway Exchange Building, Chicago.

## Remodeled Airplanes for Mail Service Route

WASHINGTON, Aug. 30—Six remodeled army airplanes, which will carry double the amount of mail carried in the D. H. type machines now in use, will soon be placed in operation on the transcontinental air mail route between New York and San Francisco, the air mail service announces.

The planes will carry 800 pounds of mail or 32,000 letters, with no additional cost in fuel or pilots, the statement said, and were remodeled at a cost of \$3,000, whereas the cost of the new machines would have been \$15,000 each.

#### BRITISH TRACTOR CUTS

LONDON, Aug. 10 (By Mail)—Tractor prices have dropped until it now is possible to get a good, fair powered utility tractor for \$1,500 (normal exchange).

## Mexican Sales Grow; Revival Has Started

### Business Shows Improvement in Some Phases—Transportation Still Big Problem

CITY OF MEXICO, MEXICO, Aug. 24—According to the statement of dealers, there has been a marked improvement in some phases of the business during the last few months. Even during the protracted revolutionary period a considerable number of automobiles, motor trucks and delivery vehicles were purchased in the United States and brought to Mexico, despite the fact that all shipments had to be paid for in cash at the border, and that there were delays in making transfers from one railroad to another and in transporting the cars to destination.

#### Transportation Problem

The transportation problem is still unsolved as to automobiles, as well as all other kinds of shipments. It is met in a measure, however, by shipping practically all automobiles by express from Rio Grande crossing points. Even express shipments are slow. It usually takes twelve days for an express car of automobiles to move from Laredo to the City of Mexico, a distance of about 800 miles. The practice of giving credit to reliable dealers is rapidly taking the place of paying cash for cars at the border.

It is estimated that there are approximately 20,000 motor vehicles in Mexico, including automobiles, delivery vehicles and motor trucks. This is a very small number when it is considered that the country has a population of more than 15,000,000 people. Just what per cent of inhabitants might be considered as prospective buyers of cars there is no means of determining. It has been said that the laboring class numbers fully 12,000,000 people. There is little prospect that many of this element will reach the automobile buying stage for many years to come unless there should be a phenomenal rise of wages.

#### Revival Has Started

During the last few months there has been a great revival of automobile sales and the establishment of agencies, accessory houses and garages. This is especially true as to the City of Mexico, which is the center of automobile distribution for the greater part of the country.

Practically all of the American and French automobile manufacturers who are reaching out for foreign trade are represented in Mexico. This is especially true as to the larger and higher priced cars. Although there are a number of American dealers here the business is not confined to men of any one nationality. This is the case not only as to the sale of automobiles and other motor vehicles, but also applies to accessories and garages.

One of the oldest and largest agencies in the City of Mexico is B. Estades y Cia., whose place of business is Av. Bucareli. The company is composed of B. Estades and R. Romano. The sales manager is J. F. Canales, who has had long experience in the various branches of the automobile business not only in the United States but in Europe and South America. He has brought American methods of salesmanship to the agency with which he is now connected. The company handles the Packard, Renault, Paige, Briscoe and Pierce-Arrow automobiles and the Packard motor trucks. In discussing the automobile situation in Mexico, Canales said:

#### Buying Power Good

"Although business conditions are not as good as they might be, the buying power of the people seems to be remarkably good when it comes to the purchase of automobiles and motor trucks. This agency sells about 25 cars and trucks a month. The banks here do not give credit to dealers as a rule. We have a credit of not over ninety days. We sell cars on one-half cash and the balance ninety days. During the last few years there has been a tremendous influx of second-hand cars to Mexico from the United States. There are now so many of these used cars in the country that they may be bought cheaper here than across the border. There must be a general discarding of worn-out cars in the not far distant future and this will improve the demand for new cars.

"We have a well equipped repair shop in which native workmen are employed with the exception of a German electrician. We have found that Mexican mechanics learn the trade quickly. They are adepts when it comes to picking up the fine points of automobile repairing. We sent our German electrician and chief mechanic, Gustavus Schmidt, to the Packard factory for a year's practical training and we found that the investment brought us good returns. We have three salesmen on the street and they use the same sales methods that are practised by the more progressive agencies in the United States.

"We carry a stock of about 100,000 pesos worth of tires. There are two automobile tire manufacturing plants in Mexico, both being located here. They make tires of all sizes. One is called the Azteca Tire Company and the other is the Pelzer Tire Company. Their products sell for about 25 per cent less than American tires."

### Paige Enclosed Car Output Quickly Sold

DETROIT, Aug. 29—Paige Motor Car Co. sold out its entire August production of enclosed cars in the first five days of the month. The demand is reported at the factory to be far in excess of former seasonal demand for enclosed types, and production will be increased to meet sales requirements.

## Used Car Situation Better in Spokane

### New Cars Going Well Also as Credit Allowances Speed Up

SPOKANE, WASH., Aug. 30—With improved business conditions and credit allowances gradually speeding up sales of new cars, Spokane automobile dealers are finding that the used car situation is assuming a less drab aspect.

Sales of used cars are dependent upon new car sales, according to E. Stock, managing-secretary of the Spokane Automobile Chamber of Commerce. Seventy-five per cent of new car sales entail used car transactions, says Stock.

"The used car situation is always a step or two behind the new car market, for at least 75 per cent of dealing in new cars is done with persons already owning cars," said Stock. "During the recent period when the automobile industry openly marked time the used car situation assumed rather discouraging proportions.

"At present the used car situation is more favorable to both purchaser and dealer. The situation is no doubt much more favorable to the purchaser than it will be during the winter months, when the car sales season is expected to slow up somewhat. When this winter period of less numerous new car sales comes, dealers will be careful about taking used cars in trade. The exchange valuation allowed will necessarily be lower and no trades will be made unless the dealer is reasonably certain of a quick turnover."

### Durant Announces Oakland Home Site

OAKLAND, CAL., Aug. 30—R. C. Durant, president and general manager of the Durant Motor Co. of California, has definitely announced the site of the Durant assembly plant in Oakland to be at East 14th Street and 106th Avenue. The site consists of 18 acres, on which will be built exclusively class A buildings, construction to be of concrete throughout, with buff pressed-brick facings and gray granite trimmings. The main building will have a frontage of 600 feet, from which will run three wings, each extending 400 feet, thus forming courts which will allow all windows the greatest possible amount of air and light. All buildings are to be of two stories.

The powerhouse will be situated between the wings, and the water tank enclosed in concrete to conform to the general plan of the plant. The second floor of the factory will be devoted to body building, paint shops, upholstery and trimming shops. The finished bodies will be sent through chutes in the floor to the waiting chasses on the main floor, where they will be carried on endless chain conveyors through the various processes of assembling.

## Reorganization of Locomobile Decided

### Company Divorced from Hares Motors Following Meeting of Stockholders

BRIDGEPORT, CONN., Aug. 27—Reorganization of the Locomobile Co. through which Col. Elmer H. Havens, junior member of the firm of Hunter & Havens of this city, president of Bridgeport Board of Education and prominent in financial, industrial, civic and fraternal circles, becomes head of the corporation and has already assumed charge of the big Main Street plant, was consummated at New York yesterday, according to announcement here to-day. Frank R. Hickman is associated with Colonel Havens, as vice-president and treasurer of the corporation.

These revolutionary changes and reorganization of the corporation were perfected at a meeting of the stockholders in New York. Through them the Locomobile Co. is wholly divorced from Hares Motors, Inc., which had charge of manufacturing and selling the automobiles built at the Locomobile plant here. Mr. Hickman was a former president of the Locomobile Co. of America, which was organized April 1, 1920, as the Locomobile Co. He was also treasurer of the Hares Motors, Inc.

#### Confirms Reports

President Havens confirmed reports of his election and the reorganization of the corporation, when interviewed at his Southbury, Conn., summer home. However, he was not ready to make a statement as to the plans for the new organization, but said that operations will be resumed at the local plant as soon as business conditions warrant. Colonel Havens and Mr. Hickman represent the creditors of the Locomobile Co. in the latest reorganization.

Rumors of a dissolution of Hares Motors, Inc., which were in circulation here a number of weeks ago, are not borne out by the change. It is pointed out that the connection of Hares Motors, Inc., with the Locomobile Co., to which the name of the local corporation was changed last year, were in the form of a contract for operation of the plant and the selling of its products. At that time the officers of Hares Motors were made officers of the Locomobile Co. Those officers have now resigned and have been succeeded by the local men, Messrs. Havens and Hickman.

#### Contract Is Dissolved

The contract between the Locomobile Co. and Hares Motors, dissolved yesterday by the reorganization of the former corporation, took effect April 1, 1920, and, at the same time, the Mercer Motors entered into a similar agreement. The Mercer Co. withdrew from the agreement April 1 last. Hares Motors is a separate corporation, according to

### CONVICTS TO MANUFACTURE 1922 LICENSE TAGS AT OHIO JAIL

COLUMBUS, O., Aug. 30—License tags for 1922 will be manufactured by the convicts in the Ohio Penitentiary, as has been the case in the past few years. The 1922 tags will be on battleship gray background with blue letters and numerals. The number the coming year will be divided by a hyphen as in many States. This is a new feature to the Ohio tags. There will be the letter D to designate dealers and manufacturers; E for electrics and T for trucks. Gasoline passenger cars will not be designated with any letter. In all there will be approximately 800,000 tags manufactured for 1922.

E. L. Larson, works manager of the local plant, and the reorganization and withdrawal of the Locomobile Co. does not affect it.

#### Won't Discuss Capital

At the time the contract with Hares Motors was made, the Locomobile Co. of America was reorganized into the Locomobile Co. and recapitalized. None of those interested would state to-day as to whether any new capital has been put into the corporation under the latest reorganization.

E. L. Larson, who has been works manager under Hares Motors, has tendered his resignation, to take effect Sept. 1, but may remain for some time in an advisory capacity, although his active duties have been practically completed. He stated to-day that he is not acquainted with any of the details connected with the reorganization of the corporation. His successor has not yet been appointed.

#### 20 Years in Bridgeport

The Locomobile Co. of America located in this city about 20 years ago, during the early days of automobile manufacture, at first making a steam propelled car. The manufacture of gasoline-propelled vehicles was soon taken up and the Locomobile, in a short time, became one of the most popular of the higher priced cars in the country. Several times the Locomobile was a competitor for the Vanderbilt cup, highest honor in automobile racing, and was successful, after several trials, in winning that classic.

Originally, starting in a small way in East Bridgeport, the business of the company has been enlarged and the present big plant at the foot of Main Street was built a decade or more ago. During the recent war a large amount of important war work, including the manufacture of trucks, tanks and other similar equipment, was turned out there.

It is expected the work at the plant will go on with added vim from now on.

## Sherman Puts Pep in Montreal Meeting

### A. E. A. Merchandising Director Is Principal Speaker at Session at Montreal

MONTREAL, CANADA, Aug. 30—The first meeting of the Montreal auxiliary of the Automotive Equipment Association was held at the Windsor Hotel with Ray W. Sherman, merchandising director of the Automotive Equipment Assn., as the chief speaker. Other speakers who addressed the meeting included A. J. Hays, president of the Champion Spark Plug Co. of Canada, Ltd., and chairman of the Automotive Equipment Association; E. J. L'Esperance of the Imperial Life Insurance Co., Montreal, and N. H. Oliver, general sales manager of the Metal Specialties Mfg. Co. of Chicago. The gist of the addresses of the evening was "Sales Promotion," and the formulating of new selling ideas which would bring into closer contact manufacturer, wholesaler, retailer and consumer.

For five minutes Sherman kept his audience in laughter describing his first two attempts at public speaking.

"To come down to business," he interposed, "this is the biggest thing that has happened in the motor industry and I venture to say that no other industry has started such a movement. We are out to do something for public weal and to put it over we must stick to the job. It can be done and will be done, nothing can convince me otherwise. As testimony of the faith I have in the proposition, I offer the fact that I willingly threw up one of the best positions to give my time to this work. I am not going to burden you with figures and statistics of the motor trade—you have probably been given these before and have perhaps read them time and again—but by trying to make my 'speech' more in the nature of a chat and giving you a few examples of how selling can be done and at the time of selling the dealer is shown that there is more in it than waiting for someone to ask for a certain article.

"Our first object is to get the goods off the dealer's shelf, by showing him how to get them off, and how to instill the idea of 'asking people to buy.' And all this is dependent on the salesman, we must have men who are enthusiastic, like their work and the people they are working for; and if every salesman will give his support just think how the business will grow. We have got to do away with the dirty shop and dusty shelf idea, we must set up inviting displays in the dealer's premises conveying the 'idea' of the goods and what their advantages are.

"The salesman must understand that the retailer is a personal friend, and he should see that that state comes about, and that he has a greater influence over the retailer than is realized. We must make the manufacturer, wholesaler, and dealer believe in this thing. When that happens mutual benefit and increase of business all round will come about. When you take into consideration the usefulness of nearly all motor accessories and the comparatively small price it is easily seen that a 'dead stock' proposition is—or should be—unknown in the automobile accessories business. Every season is a selling season, so where does the kick come in about slack business? That is usually the cry of the man who has not the stamina to 'stick it' and who 'thinks he's beaten.' Give us your earnest support in this 'closer contact' proposition and you will not only be helping us, but yourselves."

## Business Prospects— Loom in South Africa

### Business Steadily Improving, Survey Shows—Exports on the Increase Again

NEW YORK, Aug. 31—Business conditions affecting the sales of automotive equipment in South Africa are steadily improving and exports of such equipment from this country are again on the increase, with the probability that August shipments will be materially higher than those of July and June. This opinion was voiced at the local office of the National Bank of South Africa, Ltd., coincident with the issuance of the results of an automotive survey of that country. The survey was the result of a questionnaire sent out by the New York office and which was answered by the managers of the bank offices at Capetown, Johannesburg, Bloemfontein, East London, Port Elizabeth and Durban.

#### Favor Lighter Cars

The survey took up the question of road building, the competition of European manufacturers in motor car and tire lines, the development of motor truck use and the subject of spare parts. The most interesting part of the survey was, perhaps, that devoted to the European light car, the question being asked as to whether the high price of automotive fuels in South Africa would cause car owners there to drift away from the American product in favor of the lighter and smaller models built in the Old Country.

"These, in the form of the Calcott, Morris-Oxford, Swift and 'Baby' Standard, are now to be seen in increasing numbers on the streets, the last-named preponderating," read the Capetown report. "They appear to be popular for city use, but are heavily handicapped by virtue of their high initial cost. It is pointed out that in this country it is not weight reduction but efficiency of the engine that will count in the future—i.e., the small but efficient engine giving 25 m.p.g. (imperial gallon 20 per cent larger than American gallon). One authority states that the small foreign engine is not economical for country running owing to heavy gradients and road conditions generally. Also, owing to frequent gear changing the small engine brings about transmission troubles which counterbalance its apparent advantages."

#### Truck Usage Grows

This report was similar in tone to those from the other localities, the point being made that such cars were not adapted to the agricultural regions and that their first cost was in excess of the well known American makes.

Truck utilization is growing slowly in South Africa, the report from Capetown again reflecting the opinion from all districts.

"The truck is slowly but surely replacing horse traffic, at any rate in the

larger cities, but not for long distance," the report states. "It is largely used by commercial houses for town and suburban use, but to a limited extent, if at all, for agricultural purposes. There are more motor trucks in the Cape Peninsula than in any other center of South Africa, owing partly to the inefficient railway goods service and partly to better roads. In Johannesburg there would be a large field for expansion but for the fact that prospective users are diffident about employing colored drivers."

Bloemfontein answered that the one-ton truck is proving a commercial asset and that, with normal prices, a large number will be employed, especially by farmers. The Johannesburg office added that educational work would be desirable to further truck operation.

The parts situation in some localities was reported as being good, with owners having little difficulty in Capetown and Johannesburg in obtaining parts. The Capetown report declared, however, that prices for such parts are often excessive and that car owners thought this serious. East London dealers were not so fortunate, and it was said that garages were having difficulty in obtaining other parts than for Fords.

#### American Cars Lead

The known predominance of American makes of cars in operation in South Africa was shown by statements that our makes were from 70 to 95 per cent of the total, the smaller figure being reported from Port Elizabeth and the larger from Johannesburg. American and British motorcycles were reported from Durban to be in about even proportion and the statement was added that British firms are backward in service and merchandising effort.

The tire situation was not so promising, as the European Dunlop, Michelin and Pirelli are obtaining a good place in the market. Capetown estimated that American makes of tires held about 50 per cent of the sales, this likewise being true of Johannesburg. The American makes reached 75 per cent in Bloemfontein and Durban added that British and American makes were about even in price.

#### To Improve Highways

No railroad extension work took place last year and none is expected this year, but highway improvement and maintenance is being continued. The Provincial Council of the Cape Province increased the 1919-20 appropriation of £54,500 to £57,300 for 1920-21, although this may be modified somewhat. The main roads in this province total 3956 miles, with an additional 24,727 miles of divisional roads, with some 2589 miles more in Transkei, Herschel and Glen Grey.

The present road expenditures are triple over what they were eight years ago, and a scenic highway, about 100 miles in length, is nearing completion. This provides an all-round route to cover the Peninsula and opens up some picturesque and hitherto inaccessible districts.

The sale of South African products is increasing, it was added, and this has cleared the financial situation materially.

## Tractor Trials in England Sept. 20-24

### Manufacturers and Traders Society Announces 62 Entries for Event

LONDON, Aug. 19 (By Mail)—The Society of Motor Manufacturers and Traders is clearly justified up to the hilt in its determination to proceed this year with its tractor trials. The entries are now complete and the total should be more than gratifying to the promoters. They testify to the belief of the makers of both tractors and implements in the value of these annual trials and in the future of the industry. Manufacturers evidently realize that it is largely upon the results of this year's tractor trials that next year's trade will depend.

It is interesting to compare the entries with those for 1919, the society's first trial. On that occasion entrants were permitted to enter three machines of any one make and type, and as a result 56 tractors were entered for the trials. This year the society only permits the entry of two machines of any one make or type, yet, notwithstanding this restriction, no fewer than 37 tractors are entered.

Additionally, 25 special implements have been entered for test and report; these being quite apart from the implements necessarily entered with the tractors for the purpose of demonstration and test of the tractors themselves.

In addition to the trials there is to be an extensive exhibition of power farming machinery. The entries for this exhibition are not yet complete. If present indications may be taken as a guide, however, this section of the event bids fair to rival the interests of the trial itself.

### Make Tests of New Ray Battery; Study Others

NEW YORK, Aug. 30—A test of the Ray storage battery and of several other makes was made at the New York Electrical Laboratories recently to demonstrate the ability of the Ray construction to stand up under conditions of heavy charge and discharge. The test lasted two days. On the first day each battery was in turn discharged at 200 amperes for 1 minute and then at 100 amperes until the voltage was down to zero. The Ray held up 31 minutes in this test we are informed. After this test all the batteries were connected in series and charged at the rate of 100 amperes for the first hour and at 25 amperes for the next sixteen hours. When this charge was completed the batteries were again put through the discharge test. The Ray battery started at a discharge of 200 amperes which continued for one minute, and then gave 100 amperes for four minutes. The batteries were of the 6-volt, 11 plate type.

## Federal Report Says Trade Is Improving

Industry Feeling Way Out of Depression—Reductions and Good Crops Responsible

WASHINGTON, Aug. 31—Analysis of reports received from agents of the Federal Reserve Board on business conditions throughout the country show that the automobile trade is feeling its way out of the economic depression. The price reductions have stimulated sales and the early marketing of crops puts the farmer on the prospect list because of his improved financial status. The movement of crops away from farms is expected to have a salutary effect in the liquidation of outstanding indebtedness and provide a favorable credit situation.

### See Foreign Gain

The board has found evidence of improvement in some branches of foreign trade and with a fairly good agricultural yield and enlargement of manufacturing demand, it is believed the autumn season will be encouraging to trade. The Federal agents state, however, that the situation is not such as to forecast any extensive or immediate revival of business in a large sense.

Because of the fact that manufacturers and dealers alike are interested in the question of price stabilization, it is significant to note the opinion of the Federal Reserve Board: "Price movements have been on the whole limited, but with a slight upward tendency in the case of some groups. The Federal Reserve Board index prepared for international comparisons shows an increase of two points to 141. The index number of the Bureau of Labor Statistics for July was 148, the same as during June. The current price reports for the early part of August indicate if anything, a strengthening of prices in some lines."

### Forecasts Difficult

"On the whole it is impossible to forecast the general trend of prices during the month. Manufactured goods have probably held relatively firm, but as has been indicated above, many important raw materials have declined. Prices in general during the past three or four months have become somewhat more stabilized than they were in the early spring, but whether this period of relative stability will continue, whether prices will rise appreciably, or fall is a matter for speculation. A continuation of relative stability in the price level as a whole might be marked by more or less extreme variations in the prices of individual commodities if the variations cancelled one another. For instance, increases which might occur in the prices of commodities which have been "liquidated" or reduced to approximately pre-war levels might be accompanied by reductions in the prices of commodities which are still far above the pre-war level."

### FORM AUTOMOTIVE DIVISION UNDER THE DEPARTMENT OF COMMERCE

NEW YORK, Sept. 1—Formal announcement of the formation of the automotive division under the Department of Commerce and in the Bureau of Foreign and Domestic Affairs, as a part of the plan of Secretary Hoover to aid industry, was made here to-day by the National Automobile Chamber of Commerce. Gordan Lee will head the automotive division and William J. Irvine will be the automotive trade commissioner working with Lee.

Lee has had lengthy experience in the automotive industries. He was formerly in the sales department of the Ford Motor Co., working in the Fordson tractor division, in New York State. Later, he joined the firm of Gaston Williams & Wigmore and made a tour of the world with their automotive lines. Irvine was formerly with the White Co., being in the foreign sales promotion department.

Both these men are now at Washington and have begun their duties, their first work being to survey the field and determine the assistance that may be rendered the industry. Irvine probably will go abroad within a few months.

The formation of the division has been under consideration for some months and is similar to the trade divisions recently named by Secretary Hoover in other industries. It will concern itself with tractors, trucks, cars, motorcycles and equipment, in the promotion of both foreign and domestic business.

## Rubber Exports on Gradual Increase

Great Britain Purchasing Larger Quantities—Mexico Also Shows Improvement

AKRON, Aug. 31—There has been a gradual improvement in exports of rubber goods although the improvement is spotty in character and while no figures are available as yet, the improvement has been noticeable.

Great Britain is purchasing larger quantities of rubber goods according to reports of the export departments of the larger factories. The Scandinavian countries have purchased larger amounts of rubber goods during the past two months than during the previous three. Business from the east coast of South America with the exception of some states in Brazil, is gradually improving.

Business through Mexico has shown some improvement recently. In Canada the rubber business, especially tires, has shown practically the same improvement which has been registered in the United States. The depression in the rubber industry came a few months later in the foreign fields than it did in the United States, but the slight business revival which has been noted abroad came about the same time business picked up generally in the rubber field in this country.

## Columbus Has Annual Motor Show This Week

COLUMBUS, O., Aug. 30—The annual fall show, given under the auspices of the Columbus Automobile Show Co., opened at the Ohio State Fair Aug. 29 to continue for the week. The show opened under the best of conditions as some very good advertising had been done by the fair management and crowds were larger than usual. The automobile show occupied Automobile Building, which was 100 by 400 feet. Anson B. Coates was manager of the show.

Among the cars displayed were the Overland and Willys-Knight, Franklin, Hudson and Essex, Lincoln, Davis, Harry C. Stutz, Chevrolet, Sterns, Moon, Hupmobile, Cleveland, Chandler, Allen, Nash, Peerless, Maxwell, Chalmers, Buick, Studebaker, Columbia, Dodge, Oldsmobile, Pierce-Arrow, Reo, Stutz, Haynes, Cadillac, Packard, Oakland, Wescott, Auburn, Grant, Scripps-Booth, Ford, Jordan, Stephens, Lexington, Milburn electric and Roamer. A few trucks were also included in the exhibit.

### BUS PLEA IS MADE

INDIANAPOLIS, Aug. 30—Investigation of efforts of city officials and street railway officials to prohibit jitney bus operations has been begun by the Citizen's Protective Association which demands that jitney buses be allowed to operate freely in order to insure the public with adequate transportation.

## Durant to Organize Company in Canada

TORONTO, Aug. 31—Durant Motors of Canada, Ltd., is soon to be organized. The company will begin shortly to assemble the Durant four for Canadian distribution and eventually, according to W. C. Durant, will build here the entire car, even the electric system and tires.

Durant has purchased a former munition plant at Leaside near Toronto. There 2500 men will be employed and an assembly building will be erected for use right away and manufacturing on a considerable scale will be under way, Durant states, about March 1. Production of 100 cars a day is planned.

A Toronto man whose identity is not known will be associated with the American manufacturer.

### ATLAS IS REDUCED

YORK, PA., Aug. 31—Effective Sept. 3, 1921, the list price of the Atlas "Merchant's Dispatch" is reduced to \$1,550, f.o.b. York, Pa. This is the second cut in the price within a year and makes a total reduction of \$215.

## METAL MARKETS

**ALTHOUGH** stabilizing influences are multiplying, the steel market continues to present a surface appearance of price variations and fluctuations. Concessions are largely a matter of how advantageous to operating schedules the tonnage and specifications involved in individual orders may be. Some of the sheet mills have recovered to a point of operations where they can well afford to make some sacrifices in order to increase their output to a percentage of capacity that will bring the overhead down to a more normal level per ton of rolled product. To this rational motive rather than to any ambition to wage war upon competitors for the sake of weakening them must be ascribed such price inducements as buyers are able to obtain these days. It will be well for steel consumers not to delude themselves on this score. Daily newspaper reports in the last few weeks have made it appear as though the steel industry was more or less in the midst of a price war waged, as price wars usually are, by one side for the sole purpose of enfeebling the other. Nothing is further from the truth. Every producer's goal is to get enough orders on his books to bring more and more of his equipment and labor to a state of useful productivity and, succeeding in this, he doesn't waste any thought on his more or less fortunate competitors. When Judge Gary stated the other day that in the case of most mills selling prices represented very close to actual production costs, he did not intend to convey the impression that these producers were standing on the brink of becoming unfair competitors of the Corporation. He merely laid bare the plight in which the entire industry finds itself. If there is a steady increase in mill operations from now on, it will be a stabilizing factor of prime importance. In connection with agitation to bring about early downward revision in freight rates on steel and steel products, it is noted that many of the transportation interests support this movement. Apparently the Interstate Commerce Commission's attitude is the chief stumbling block which, executive traffic officials of the steel companies opine, it will be possible to overcome in good time. Such revision of freight rates would, of course, exert paramount stabilizing influence on steel prices and, now that labor rates have been adjusted all around, would tend to bring out considerable buying for future delivery, which is a *sine qua non* of genuine stabilization.

**Pig Iron.**—The market is turning more and more into a sellers' affair. Automotive foundries, however, are not figuring very prominently in the market at this time.

**Steel.**—A broadening demand for automobile sheets is noted, with the smaller rolling mills quoting 4.45c. for the base gage, a reduction of \$5 a ton from the recent asking price. In some instances 4.35c. is said to have been the price named for No. 22 gage. In pre-war days 1.35c. was the customary spread between black and full finished sheets, but it is recognized that higher labor costs, etc., have made obsolete this spread, which, on the 2.75c. basis for black sheets, would make the price for full finished sheets 4.10c. No change is noted in the strip steel market.

**Aluminum.**—With some of the Continental ingots, 98 to 99 per cent pure, offered at as low as 19c., there are those who wonder whether the anti-dumping law may not be invoked if European producers continue to flood the American market with aluminum at prices jeopardizing continuity of Ameri-

can production. Consumers, however, contend that the salvation of the American aluminum industry lies in meeting these prices, at which automotive consumption would increase considerably.

**Copper.**—The market is decidedly easy, producers offering no opposition to the lower prices that have resulted, apparently because of a desire to stimulate further buying and reduction of accumulations.

**Tin.**—The market is quiet and prices continue low.

**Lead.**—Moderate steadiness characterizes the lead market.

**Zinc.**—Dulness continues to prevail. Consumers not buying.

## INDUSTRIAL NOTES

**Duplex Motor Truck Co.,** Lansing, is sending its experimental passenger bus on a tour of Ohio and Indiana, to demonstrate the possibilities of meeting transportation problems by bus operation. The Duplex bus has been in operation for two months in Lansing, demonstrating its adaptability for public transportation.

**Mission Motor Co.,** Los Angeles, has been appointed Dort distributor for southern California. George Goodrum, president of the company, is a veteran Coast distributor and associated with him is F. A. Petrie, who was formerly assistant general sales manager for Dort at the factory.

**Rubber Products Mfg. Corp.,** Kansas City, has been formed and chartered to operate the Kansas City Tire & Rubber Co., which for two years had been operated under lease by the A. J. Stephens Rubber Co., which will continue to distribute output.

**Spicer Mfg. Co.,** Plainfield, N. J., reports August the best month in some time. John Lee, a company official, says business has been showing great strides.

**Studebaker Corp. of America** has moved its Detroit sales branch into the new headquarters at 3646 Woodward Avenue.

## WISCONSIN FAIR OPENS

**MILWAUKEE, WIS., Aug. 30.**—What is planned by the Milwaukee Automotive Dealers Association to be the most intensive selling effort it has ever undertaken is the annual State Fair motor show, which opened to-day with the seventy-fifth annual agricultural exposition at West Allis, suburb of Milwaukee. Not only is this year's show to be a merchandising campaign of a high order, but the occasion will be employed to give the public a new conception of the utility of the passenger as well as commercial car to the end that "pleasure" and "luxury" be abolished in popular descriptions of passenger cars. The ways and means for accomplishing this end will be unfolded as the show progresses. It will close with the fair on Saturday afternoon, Sept. 3.

## LINCOLN LIGHT STARTS

**MILWAUKEE, WIS., Aug. 18.**—The Lincoln Light Corp. of Milwaukee, which was organized several months ago, has commenced manufacturing operations in a new plant at Grafton, Ozaukee County, north of Milwaukee.

## FINANCIAL NOTES

**Fisher Body Co.** for the three months ended July 31 reported a surplus after all charges, including Federal taxes, of \$1,212,236. Allowing for dividends on the preferred stock, this was equal to \$2.30 a share on the 500,000 shares of common stock of no par value outstanding. In the corresponding period of last year the company reported a surplus of \$2,221,553, equivalent to \$4.29 a share on the same amount of stock. Net earnings for the period ended July 31 amounted to \$1,720,643. Interest payments called for \$227,587 and reserves for Federal taxes amounted to \$280,820, leaving the surplus of \$1,212,236. In the same period of 1920 net earnings were \$3,673,642, after deducting \$283,299 for interest and setting aside \$1,168,700 for tax reserves, leaving the surplus of \$2,221,553. Net earnings were calculated after deducting all charges for repairs, maintenance and depreciation.

**Motors Products Corp.** directors have arranged to purchase for retirement 32,000 shares, or approximately 40 per cent of the company's capital stock outstanding, at a price not to exceed \$50 a share, according to information obtained yesterday. Under the plan the stockholders are given the privilege of disposing of their pro-rata holdings as of the close of business Aug. 23, 1921, and the right to exercise the option to sell any or all of their pro-rata shares expires Sept. 6, 1921. The directors are authorized to buy from any available source the number of shares needed to retire the full amount mentioned under the plan, provided the stockholders do not consent to dispose of their pro-rata holdings. All stockholders who desire to dispose of more than their pro-rata share are authorized to notify the directors.

**Raybestos Co. of Bridgeport, Conn.,** manufacturers of automobile brake linings, Ford accessories and automotive supplies, increased the capital stock from \$3,000,000 to \$8,000,000, it was disclosed by papers filed in the town clerk's office here. There is an increase of common stock shares from 15,000 to 30,000; of preferred stock shares from 15,000 to 50,000. None of the stock is on the market, it is announced. The increase of capital stock was to finance the purchase of the General Raybestos & Rubber Co. of Charleston, S. C. This is an older concern than the local one and operates spinning mills of Raybestos fabrics. The combination, it is stated, means a strengthening of both organizations. The Charleston concern will supply the local concern with most of its material.

**Keystone Tire & Rubber Co.** reports for the six months ended June 30, last, deficit from operations \$247,018, and a deficit after interest, losses, taxes, etc., of \$279,729. The balance sheet as of June 30, last, shows cash on hand and in banks, \$48,935; accounts receivable, \$2,193,339; bills receivable, \$73,504; merchandise inventory, \$565,287; accounts payable, \$384,678; deficit, \$591,936; total assets and liabilities, \$3,876,423.

**Martin-Parry Corp.** board of directors has this day declared a quarterly dividend of 50c. a share on the capital stock of the corporation, payable Sept. 1, 1921, to stockholders of record at the close of business Aug. 15, 1921. The transfer books will not be closed.

**Packard Motor Car Co.** has declared the regular quarterly dividend of 1½ per cent on the preferred stock, payable Sept. 15 to stock of record Sept. 1.

**BANK CREDITS**

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, Aug. 30—In spite of business depression and widespread unemployment, the savings banks of New York State have gained nearly \$250,000,000 in deposits in the year ending July 1, 1921, of which \$93,000,000 came from interest credited on deposits, while \$156,000,000 represented new deposits. The number of depositors increased by 83,000 in the same period. Total resources of New York State savings banks on July 1, 1921, were \$2,856,110,000, a gain of over 10 per cent in the year.

The Federal Reserve system continues its improvement by remarkable strides from week to week. The ratio of total reserves to deposit and Federal Reserve note liabilities combined increased from 65.8 per cent on Aug. 17 to 66.5 per cent on Aug. 24, while the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, advanced from 86.3 per cent to 87.7 per cent. This improvement was accomplished by an increase of \$19,000,000 in gold and \$2,000,000 in other reserves, making the total reserves on Aug. 24 \$2,766,000,000, and by a decline of \$18,000,000 in note circulation, which was \$2,486,000,000 on Aug. 24. Total deposits increased by \$2,000,000 to \$1,674,000,000, due to an increase of \$12,000,000 in Government deposits, and a decrease of \$10,000,000 equally divided between the member bank reserve account and all other deposit items. Note circulation since it reached its highest point of \$3,405,000,000 last December has declined \$920,000,000, or 27 per cent. Total bills on hand declined during the week by \$23,000,000 to \$1,530,000,000 on Aug. 24. Bills bought in the open market declined \$6,000,000 and bills discounted secured on Government obligations declined \$18,000,000, while commercial bills discounted increased \$1,000,000.

Although the crop moving demands upon the money market are still increasing, money rates have fallen off slightly. Call money ranged from 5 per cent to 5½ per cent last week, compared with a range of 5½ to 6 per cent the previous week. On Friday last 5 per cent was the only rate quoted throughout the day, while loans were made outside the Stock Exchange at 4½ per cent. Time money also declined from a range of 6 per cent to 6¼ per cent to 5¾ per cent to 6 per cent for all maturities, but trading was comparatively dull. Prime commercial paper, on the other hand, for all maturities up to six months, was fairly active with the rate at 6 per cent. Demand came chiefly from country banks. Whatever the cause of the ease in money rates, statistics which show a total of \$2,340,000,000 of new securities offered in seven months ending July 31, 1921, compared with \$2,567,000,000 offered in the same period of 1920 and \$2,184,000,-

000 in the first seven months of 1919 indicate that our investment market is absorbing new capital issues to the same extent as usual. However, few new issues were brought out in August.

## Demand for Motor Cars Better in Charlotte

CHARLOTTE, N. C., Aug. 30—The motor car demand in this section is improving. Coddington's special train has just made another trip from the Buick factory, bringing this time 201 automobiles of different types, and other distributors are also bringing them in about as fast as they can get them. The Anderson Motor Co. of Rock Hill reports an improvement in business, their dealers now placing good sized orders for their product. Charles R. Shanks, vice-president of the company, is of the opinion that recent favorable action by the Federal Reserve Board toward relieving the cotton situation in the South is one of the principal factors in bringing about this improved condition. Another factor, says Mr. Shanks, is the realization on the part of car buyers that the limit of low price levels has been reached and that in all probability the next change in price will be upward.

The Anderson plant at Rock Hill, which had been operating on half time during recent weeks, is now going ahead on full time. The company has recently made improvements in its cars and added two new models and these are contributing factors to the plant's activity.

## Indian Refining Wars on Standard Oil Prices

INDIANAPOLIS, Aug. 30—A fight is being waged between the Indian Refining Co. and the Standard Oil Co. here. The Indian Refining Co. equipped with a battery of twelve new Packard trucks has announced through their officers that two cents a gallon is a sufficient margin of profit for filling stations and garage-men who sell gasoline. The price has been cut and further declines are promised since officials of the company have arrived from New York. Officials of the Standard Oil Co. declare that they do not wish to enter into any controversy with the Indian Refining Co. or any other company, but at the same time every cut in price on the part of the Indian Refining Co. will be met by the Standard Oil.

## Kelsey Wheel Official Dies After Long Illness

DETROIT, Aug. 31—James S. Stevenson, vice-president of the Kelsey Wheel Co., died here Tuesday after a two years illness. He had been a resident of Detroit since 1887, joining Berry Bros, Inc., and later becoming general manager of that company.

Stevenson was probably as well known here as the biggest men in the automotive industry.

**MEN OF THE INDUSTRY**

George Sprowls, of the factory manager's staff of the Goodyear Tire & Rubber Co. of Akron, has sailed for an extensive survey of economic and export trade conditions in Europe. He will spend a year investigating foreign trade conditions with reference to the tire and the automotive industries. Sprowls will be in Berlin on Sept. 23, for the first German automobile show held since the war. He will also attend the Paris automobile show in October, and the English automobile exhibit at London in November. His business survey will include France, Spain, Germany, Holland, Belgium, Switzerland, Norway, Sweden and Denmark.

H. R. Hoskin, manager of the accounting department of the Goodyear Tire & Rubber Co., has been named assistant comptroller of the company. The comptroller's office was established when E. G. Wilmer succeeded F. A. Seiberling as president under the new Goodyear financial control, and takes the place of the old Goodyear board of control. A. J. Blanchet also has been named assistant comptroller. P. E. H. Leroy, manager of the foreign finance department, has been named assistant treasurer.

Ralph L. Ross, for two years general superintendent of the Moreland Truck Co. of Los Angeles and formerly connected with the Continental Motor Corp. at Detroit and Muskegon and superintendent of the Beaver State Motor Co. of Portland, Ore., now has become connected with the Leach-Biltwell Motor Car Co. of Los Angeles. Ross has assumed charge of the motor department, production end, of the Leach factory.

Chas. A. Nevins, consulting engineer of New York, has joined the organization of the Cameron Motors Co., New York, and will be general manager and chief engineer of their recently acquired plant at Greenville, Mich. Nevins has been associated with the automotive industry for a number of years, both in the United States and Canada.

Morris H. Anderson has assumed charge of the Detroit branch of Mack International Motor Truck Corp., succeeding W. W. Helte, transferred to the head office in New York. Anderson was formerly assistant manager of the central territorial division for Mack, with headquarters in Chicago. Before that he was with Packard.

H. B. Phipps, export manager for the Hudson-Essex Motor Car Co. for the past eight years, has been appointed sales manager by O. H. McCormack, general sales manager. Irving Segwalt has been appointed assistant sales manager in charge of car distribution, and C. V. Williams, export manager.

Charles M. Steele, who was reported in last week's Automotive Industries to be the new advertising manager for Studebaker is and has been for some time manager of the bond department of the banking firm of Dominick and Dominick, New York.

H. S. Durant, of the American Steel & Wire Co., Chicago, has been appointed sales agent and M. W. Floto, assistant sales agent at the Detroit office, to succeed M. Whaling and T. J. Usher, Jr., resigned.

Roy F. Irvin has been made sales manager of the Steel Wheel division newly organized by the Motor Wheel Corp. He will also continue his duties as advertising director.

J. Paul Winchell has been added to the research staff of the Duplex Truck Co., Lansing, Mich.

## Calendar

## SHOWS

- Sept. 5-10—Indianapolis, Automobile and Accessory Show in conjunction with Indiana State Fair conducted by Indianapolis Automobile Trade Association, John B. Orman, Mgr.
- Sept. 28-Oct. 8—New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.
- Nov. 14-19—Jersey City, Second Annual Automobile Show of Hudson County Automobile Trade Association, Fourth Regiment Armory.
- Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.
- January—Chicago, Automobile Salon, Hotel Drake.
- Jan. 7-13—New York, National Automobile Show, Madison Square Garden, Auspices of N.A.C.C.
- Jan. 28-Feb. 2—Chicago, National Automobile Show,

- Coliseum, Auspices of N.A.C.C.
- Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.
- Sept. 9 to 17—Ottawa, Ont., Can.—Ottawa Motor Show.
- Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

- September—Buenos Aires, Argentina, Passenger Cars and Equipment, La Pabellon de las Rosas, Automovil Club Argentino.
- September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery, Palermo Park; Sociedad Rural Argentina.
- September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.

- Sept. 5, 1921—Constantinople, Traction trials under the direction of the Turkish Ministry of Agriculture.
- Sept. 23-Oct. 2—Berlin, German National Automobile Show, Auspices of German Automobile Mfg. Ass'n and German Automobile Club.
- Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.
- Nov. 4-12—London, British Motor Show, Society Motor Mfrs. and Traders.
- November 7-14—Paris, Seventh International Exposition of Aerial Locomotion in the Grand Palais of the Champs Elysees, Held by the Chambre Syndicale des Industries Aeronautiques.
- March, 1922—Santiago, Chili, Annual Automobile Show.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador, Automotive Section.

Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Association Automobillista Brasileira.

## CONVENTIONS

- Sept. 14-15-16—Detroit, Credit Convention Motor and Accessory Manufacturers Association.
- Oct. 12-14—Chicago, Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.
- Nov. 22—New York, Convention of Factory Service Managers, National Automobile Chamber of Commerce.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

## RACES

- Labor Day—Unlontown, Pa., Autumn Classic.

Indianapolis to Have  
Two Fall Motor Shows

INDIANAPOLIS, IND., Sept. 5—Indianapolis is to be treated to two automobile shows this fall. The first, plans for which have been under way for weeks, will be that staged by the Indianapolis Automobile Trade Assn. this week. The second will be held in conjunction with the Industrial Exposition, which is to be held the week of Oct. 10. The two shows are similar in that automobiles and accessories will be shown, but they differ in that the latter exposition will be open only to Indianapolis-made products. Requisitions for space already have been received from the automobile manufacturers here and from the tire and accessory manufacturers.

The automobile manufacturers will show in a group, space having been taken out sufficiently large to permit them all to make displays. The same thing is true of the tire and accessory manufacturers. Walter C. Marmon, head of the Nurdyke-Marmon Co., and Harry C. Stutz of the H. C. S. Motor Car Co., both are on special committees making preparations for the event. The exposition is being staged under the auspices of the manufacturers' committee of the Indianapolis Chamber of Commerce, and the automotive industry is well represented on this committee. On this committee are George M. Dickson of the National Motor Car Co., D. McCall White of the Lafayette Motors Co., Paul P. Parker of the Parker Tire & Rubber Co., Harry C. Stutz of the H. C. S. Motor Car Co., L. M. Rankin of the Duesenberg Motors Co., Warren D. Oakes of the Oakes Co., John C. Orman, manager of the Indianapolis Automobile Trade Assn., and J. A. Daugherty of the Robins Body Corp.

## RUSH WORK ON PLANT

MUNCIE, Aug. 30—Preparations for resuming operations at the Sheridan Motor Co., former General Motors Corp. plant, now owned by the Durant Motor

Co., are being rapidly pushed forward. It is the intention to make a new six cylinder car of practically the same specifications as the Sheridan, which name may be retained.

## TO OPEN NEW METAL FOUNDRY

MILWAUKEE, WIS., Aug. 30—The American Metal Products Co., manufacturer of Ampco bronze and brass castings, bearing metals, etc., expects to start the operation of its new \$100,000 foundry and machine shop within a week to ten days' time. The building is of brick and steel, 60 x 120 ft., with a separate office and transformer house, pattern shop, storage buildings, etc. A Detroit electric melting furnace of 1000 lbs. capacity has been purchased from the Detroit Electric Furnace Co. With the new plant and equipment the company expects to enter the general brass and bronze casting field on a tonnage basis, continuing to make special bearing metals and similar specialties for the gas engine, machinery and automotive industries generally. Carl J. Zaiser is secretary-treasurer and general manager of the company.

## TO MAKE NEW BEARING METAL

BLOOMINGTON, ILL., Aug. 30—The John M. Ryan Foundry Co. of Rock Island, Ill., has secured the exclusive motor vehicle rights for the manufacture of a new lead and copper bearing alloy invented by A. H. Ackerman of Chicago. A closer amalgamation than has been obtainable heretofore and greater uniformity are claimed for the new alloy. The physical properties are given as follows: Tensile strength, 19,600 lbs.; elastic limit, 14,700 lbs. A new company is to be formed and new buildings are to be erected for the production of the alloy, and it is also planned to license other bearing companies to use the metal. One of the advantages claimed for the new bearing metal is that as compared with brass backed babbit bearings, bearings made of it cost only half as much to produce.

Demand Increases  
Around Cleveland

CLEVELAND, Aug. 30—Cleveland automobile manufacturers have experienced an increased demand for their products since Aug. 15. This, coupled with business already on hand for the month, assures a healthy condition of production for September. October is looked forward to with optimism by the average auto maker here.

The average manufacturer experienced a slight let-up in the demand during the latter half of July. This slowdown continued through the first two weeks of August. But things have picked up considerably. The condition is considered especially good in view of the fact August is a vacation month when the family stocks up for the outing, and car buying ordinarily slows down greatly.

At the plant of the Jordan Motor Co., for instance, dealers reported sales of 150 new cars per week the first two weeks of July. That is at the rate of 600 cars a month. In the last two weeks of July sales dropped to 125 cars a week. In the third week of August sales were 135 cars. During this period the dealers were selling approximately 75 to 100 used cars a week. This is a barometer that correctly records what is taking place in this city.

At the plant of the Stearns Co., G. W. Booker, the sales manager, said his concern had experienced a trade increase since Aug. 15. The factory is running at 90 per cent of normal. The company has booked many orders for the new five-passenger, two-door brougham coupé that is to be put on the market Sept. 1.

Another barometer of conditions is the report of the McGraw Tire & Rubber Co. for July. Net earnings for the month totaled \$35,000, compared to \$20,000 in June. The company is making 2000 tires a day and 300 tubes. It was said sales are running 4000 tires daily. On this schedule the inventory is being reduced rapidly.

**MAKE NEW WORLD RECORD  
AND WIN EVERY PLACE  
at  
BUFFALO BOAT RACES  
Aug. 11, 12, 13, 14**

**C**HAMPION "Dependability," which was so well demonstrated at the Indianapolis Races, was further emphasized by their wonderful performance at Buffalo, when used in marine engines.

In the Displacement Race for the Fisher-Allison Trophy, four out of the five boats that started were equipped with "Champions" and were

the only ones to finish.

When other spark plugs had failed, Orlo III, the Sea Sled, did not finish; but after equipping with "Champions," broke the world's record for Displacement Boats, averaging 57.88 miles per hour.

In the Cruiser Race both entries, the Sea Horse and Miss Liberty, were equipped with "Champions."

**Champion indestructible "3450" insulators and patented copper-asbestos gasket construction, guarantee absolute spark plug dependability**

Toledo, Ohio**

# WALTHAM SPEEDOMETERS

## *A Great Invention*

THE Waltham Quality Speedometer is the only Air-Friction automobile speed registering device in the world. It was invented by the world famed Nikola Tesla, and improved and perfected by Waltham. It follows the speed of the car instantly and accurately. It is unaffected by climatic or barometric changes. It is an instrument of superlative quality and *precision*, and is used on the world's leading cars, including Cunningham, Lafayette, Leach-Biltwell, Lincoln, Packard, Pierce-Arrow, Renault, Rolls-Royce, Stevens-Duryea, Wills-Sainte Claire and others. It is made with the same painstaking care as the famous Waltham Watches and Automobile Timepieces.

## Statistics Don't Tell the Whole Story

Accurate statistical data are of great value to the industry, but figures alone cannot present a true picture. Economic and human factors must be considered if fair conclusions are to be drawn.

By Norman G. Shidle

**O**NLY to those with a thorough knowledge of a subject appear the many difficulties and complexities involved in solving its problems. A voluminous book is being prepared, for instance, which will contain the history of every word in the Latin language. The problems which will arise in the preparation of this book can scarcely be conceived in detail except by scholars interested and active in similar research.

While this fact is pretty well understood in general, there are still many persons to be found who will attempt to settle precisely and accurately problems containing many variables which have puzzled students for years. This is witnessed by the five people that are found by Inquiring Reporters every day in various cities, who are willing to have their name and address attached to a one-sentence-answer to such queries as "What is the solution of the Irish question?" "What should Congress do about taxes?" etc.

Sometimes even a careful observation of an industry fails to reveal satisfactory data upon which to base final conclusions. Much has been said and written concerning the past and future of the automotive industry. Considerable statistical data have been marshalled to prove this or that conclusion. In a general way, it may be said that such attempts at analysis are encouraging as denoting a desire for more accurate knowledge

of the commercial phases of the industry. But the danger of drawing conclusions on the basis of insufficient data must be guarded against very strongly.

It is interesting to note that no attempt to analyze in detail the future of the automobile industry on the basis of the statistical data now available has come from any particularly authoritative source within the industry. There is some significance to be attached to that fact. Those directly interested in the general phases of the industry have made extensive efforts in collecting and interpreting statistics of various kinds. As a result of these interpretations, conclusions of a limited nature have been drawn from time to time. But no attempt has been made to predict exact future figures, because such agencies recognize the futility of such efforts in view of the variable factors involved.

There is, of course, every reason for wishing to peer into the future; to predict with some degree of accuracy just what is the future market for cars and trucks; to determine how best to sell to that market. AUTOMOTIVE INDUSTRIES has emphasized very strongly the need for research and investigation along this line, but has pointed out coincidentally the danger of drawing final conclusions on the basis of incomplete data.

It is practically impossible to discuss intelligently the

automobile industry and its future purely on the basis of statistical data, since such a discussion necessarily involves economic and psychological factors not reflected from statistical information. Moreover, the gross inaccuracy of the figures available renders such an attempt even more difficult.

Even when every effort is made to get the statistics as nearly correct as possible, and even when an attempt is made to allow for errors and inaccuracies, the variables involved in the present data are so great and the general economic factors affecting the discussion are so strong as to render misleading practically any survey based entirely upon statistical information.

Only very general indications and trends can be observed. From this standpoint present statistics are of value; but an attempt to make anything like mathematically accurate deductions is almost certain to be misleading.

The real need of the automotive industry is more accurate statistical data compiled upon sound economic basis. Every effort should be exerted to encourage the more extensive gathering of such data and to outline the proper fundamentals upon which it should be assembled. It is worth while to discuss more in detail the specific inaccuracies and difficulties which present themselves.

The confused state of the registration figures even at the present time precludes the possibilities of a very high degree of accuracy. The farther back the calculations are carried the more inaccurate these figures become. It is possible to build up a theoretical registration on the basis of past production figures and the life of a car, but such data are of little value since it has thus far been impossible to determine with any degree of accuracy the life of a car. The only way this life can be calculated is on the basis of registration figures. Thus the circle of inaccuracies is completed.

The necessity for considering separately the passenger car and the truck when discussing future makes and trends, moreover, has not been sufficiently recognized.

The future of the car and the truck rests upon fundamentally different bases. Their development will proceed along different lines and will be caused by different economic forces. To consider gross registration or production figures of motor vehicles as a basis for predicting future trends is to insert a fundamental error which will render inaccurate the reasoning and conclusions drawn from them.

For the same reasons segregated registration figures are necessary. General conclusions and prophecies cannot be made from registration figures alone unless the details of gathering and compiling those figures are understood. And when these factors are studied it becomes evident that sufficient data for an intelligent analysis on the basis of statistical data are simply not there.

Many states do not yet segregate car and truck registrations at all. This fact alone makes even approximate accuracy nearly impossible. But further analysis of registration methods shows the following vagaries in connection with this matter of segregating car and truck registrations:

Some states register tractors with trucks and do not

register trailers; others register trailers with trucks and do not register tractors; others register both tractors and trailers with trucks; still others register neither tractors nor trailers in any way. All these factors enter into a consideration of the registration figures even in those states where segregation between cars and trucks is apparently made.

All these difficulties render dangerous any attempt at general predictions on the basis of statistical data alone. Even an intelligent effort to get results from such material is likely to go astray far enough to render the conclusions drawn unsound as a basis for commercial plans.

Take the matter of estimating the replacement market which has been attempted by numerous persons. Some general idea as to this market can and should be determined by every manufacturer and parts maker. But to base detailed plans on such an estimate may lead to very bad results.

A banker, for instance, who has studied the statistics of the industry very carefully and who has honestly attempted to interpret accurately the many variables, estimates the replacement market in the near future at 1,500,000 cars. Another executive closely connected with the industry who has made a similar close study of the situation estimates it at 1,800,000. This is a variation of 300,000 cars. Estimating the average car value at \$1,000 this means that there is a difference of \$300,000,000 in the possible sums to be derived from replacement sales according to which of the estimates is accepted.

This illustrates vividly the danger of attempting to make detailed plans or to derive specific conclusions purely on the basis of available statistics. The variation shown in these two estimates, both carefully made, is not at all surprising to anyone who has studied the sources and the methods of compilation of the

various sets of figures involved in the calculations.

The government export figures furnish another basic set of statistics for compilations of this kind. The deficiencies of these figures during recent years are common knowledge throughout the industry. So here again enters inaccuracy and variables. In this connection, however, it should be noted that a marked improvement in this particular statistical field can probably be expected at once, since definite efforts to render these export figures more accurate and more valuable are already under way by the Department of Commerce.

The automotive industry has become so much a part of industry and society as a whole in this country, its development is so closely bound up with a number of economic and psychological factors that no sound discussion of its future can neglect consideration of these factors. The very fact that they are intangible and difficult to evaluate simply emphasizes the futility of trying to get a mathematically correct answer to such a question.

Even those who have studied the situation carefully do not always recognize this vital point. A recent writer on this subject, who according to his own statement, recognizes the inaccuracy of much of the available data, discusses these difficulties, and then says: "The questions involved in all these possibilities suggest sources of error. These are at present unavoidable and they modify but do not at all destroy the value of the figures used."

It is possible for inaccuracies to so far modify the

value of statistics as to entirely destroy their usefulness for detailed calculations. That is the case in regard to the figures under discussion in this article. When the inaccuracies are great enough to allow two careful studies of the same figures to arrive at conclusions differing by \$300,000,000 as regards the gross selling price of the product, it becomes apparent that the value of the figures for the purpose of such calculations is more than "modified."

The necessity for more accurate statistics has been emphasized. Until better conditions in this regard can be brought about, however, the present figures must be used to the best advantage possible. Despite their inaccuracies there is a function for which present figures can be used. They are extremely useful as indicating general trends, in forming a basis of comparison in a general way, and of pointing the way to the broader and less detailed phases of the future.

It is natural that business men, connected in various ways with the automotive industry, should try to determine with some degree of accuracy what the future holds during the next few years. It is absolutely necessary that the human and economic factors be considered along with the available statistical data in any attempt

along these lines. The results, obviously, will be less concrete, but will present a picture of the situation much nearer to truth than any discussion which excused consideration of these vital factors.

The accumulation of accurate data, upon which production and merchandising plans can safely be based is one of the chief problems with which the industry should be concerned at the present time. Individual firms can do much along this line by intensive cultivation and analysis of specific sales territories. The whole industry can actively attempt to get a uniform method of automobile and truck registration throughout the country, and the industry can co-operate with government officials—as it is doing now—in making export and import figures more accurate than they have been in the past.

The individual merchandising research of the various companies, while a matter of immediate dollars and cents sales value, will constitute a step in the direction of accumulating better statistics upon which the plans and progress of the industry as a whole can be made. It is upon the side of getting better statistical data that the industry must concentrate its efforts. Definite conclusions drawn on the basis of the extremely inaccurate statistics now available are just as likely to be definitely wrong as definitely right.

## Progress in S. A. E. and Government Standards Work

THE importance of standardizing body nomenclature has been recognized by the Passenger-Car Body Division of the Society of Automotive Engineers and as a result a subdivision was appointed which recently submitted a report to the division. The report covers 12 fundamental types of bodies, but permits a certain amount of freedom in the selection of additional names based on the fundamental types.

The fundamental body types recommended are: roadster, touring, sedan, berline, coupe, coupelet, limousine, brougham, limousine-landaulet, brougham-landaulet, cabriolet and town-car. The latter term is really a more general term for certain of the chauffeur-driven types. Complete definitions are given for each type. Various other types are also covered in the report, but only as variations which have existed for some time. The term touring phaeton is used in place of five-passenger touring based on present custom.

The Passenger-Car Body Division has also tentatively recommended the following door-fit clearances:

Location	Clearance, In.
Hinge Side .....	1/8
Lock Side .....	3/16
Bottom .....	7/32
Top .....	1/8
Jamb .....	3/16
Bead .....	3/32

These clearances are for all types of bodies and are measured from wood-to-wood or metal-to-metal before painting. Top clearance does not apply to open bodies.

These standard clearances, if adopted, will be of great assistance to passenger-car body engineers.

The Division has tentatively recommended that door handle squares shall be made from 5/16-in. cold-drawn key stock with tolerances of plus or minus 0.001 in. There has, however, been some criticism as to these tolerances, it being stated by some manufacturers that they are too close and that steel cannot be obtained on the market within these limits.

It is considered, however, that for good workmanship these tolerances should be adhered to and it is known that certain well-known automobile companies have obtained key stock to this specification for several years.

At a meeting of the National Screw Thread Commission, recently held at the Bureau of Standards, a program for the continuance of the commission's work was discussed. The following program was agreed upon and will be carried out under the direction of the subcommittees:

(1) Specifications and tolerances for taps, dies and tap drills; (2) standardization of bar stock for producing cut and rolled threads; (3) standardization of bolt heads, screw heads, and nuts; (4) standardization of instrument thread and threads cut on brass tubing; (5) standardization of Acme, square, buttress, and other special threads, and (6) tolerances and allowances for Class IV, wrench fit.

The Progress Report, recently issued, is also to be further studied with a view to incorporating in it more information as to the specific class of fit and series of thread pitches to be used under different conditions.

At a recent meeting at the Bureau of Standards attended by representatives of government departments and of the manufacturers ways and means for devising government tire specifications with a view to adopting better standards were discussed. Specifications for tires which the Bureau had prepared were submitted to the committee for discussion and the various members suggested such changes as seemed desirable. The committee decided to send a copy of the specifications, together with these recommended changes, to the Rubber Association of America for their consideration and possible further revision. The specifications and the resulting changes are then to be returned to the Bureau of Standards when a second meeting will be called for further consideration of the problem. When completed, these specifications for tires will be available for use by the various branches of the Government, municipalities, and private corporations who buy tires in quantity.

# Smaller Tractor Added to Cleveland Line

Extensive use of pressed steel parts, greater accessibility, and single point lubrication among the features of new product which weighs 1820 lbs., is 80 in. long, 50 in. high and 32 in. wide. Frameless type power-plant includes  $3\frac{1}{4} \times 4\frac{1}{2}$  in. four-cylinder engine designed to burn kerosene.

By J. Edward Schipper

A NEW and smaller Cletrac has been added to the line of the Cleveland Tractor Co., the new model being featured by a wide range of adaptability and low weight. It weighs only 1820 lb. and the over-all dimensions are 80 in. in length, 50 in. in height and 32 in. in width. It is claimed to be capable of plowing from 6 to 8 acres a day with a standard, two-bottom, 12 in. plow and of performing any other of the usual farm tasks. To make it universally applicable, a two row cultivator specially designed for use with this machine has been put on the market.

From an engineering standpoint, the new tractor incorporates a great many new features. It is particularly noteworthy for its accessibility and simplicity. Pressed steel parts are used to an unusual degree and this practice is responsible for the lightness of the finished product. Simplicity has been secured by discarding the main frame. The engine, transmission and differential assemblies are bolted together as in

the frameless type of wheeled tractor, this construction ensuring both compactness and accessibility. There is little similarity to the older Cletrac model except that both are of the creeper type. Instead of the track running over wheels, it operates on a floating roller chain, and the drive is by sprocket. Parts which are subjected to intense stress are of chrome steel, and practically the entire assembly is made up of pressings. These include such important parts as track shoes, track frame, roller chains, sprockets, radiator cover, fuel tank support and fenders. Altogether, there are 900 lb. of pressed steel on the machine, which is about 50 per cent of the total weight. It is estimated that the use of pressed steel saves from 25 to 30 per cent in weight over the usual iron construction.

To give an idea of some of the accessibility features it may be stated that the entire radiator core may be

removed by taking out two screws and undoing two hose connections. The core can then be pulled vertically out of the pressed steel core case, which, being a flanged member, takes all of the stresses and eliminates strains on the core. The core case is supported by a bridge to the transmission case. This bridge, consisting of two longitudinal pressed steel members, carries the fuel and oil tanks and the air washer. The entire bridge with the tanks and air washer can be removed by taking out

four screws and disconnecting the gasoline line. This leaves the engine head free for removal and enables the operator to reach anything on the upper part of the engine assembly. Incidentally, the mounting of these tanks on the bridge puts the carburetor and air intake in a high, and therefore relatively dust-free, location.

Another advantage of the location of the fuel tank on the bridge is that it provides a straight gravity feed to the carburetor, although the latter is mounted

The new model F Cletrac, showing floating chain drive

on top of the intake manifold, giving a down draft arrangement. This causes the heavy ends of the fuel to drop on the hot-spot, which is thus rendered particularly effective, besides which the passage from the carburetor inlet to the valve is shortened. This, of course, has the advantage of reducing condensation to a minimum. The temperature of the hot-spot is held at about 450 deg. Fahr. Kerosene is the standard fuel, though gasoline may be employed if desired. The fuel tank is provided with a small auxiliary sub-tank for gasoline used for starting.

Returning to the subject of accessibility, the ease with which the various units can be removed may be illustrated by a few more examples. The gear driven fan, the helical timing gears and the cross-shaft for the magneto and water pump are all part of an assembly mounted on the front end of the engine. The water pump may be pulled

out from the side by removing four bolts from the water pump flange. The water pump drive gear comes with it. Alternately, the entire front motor gearcase casting may be removed, carrying with it the timing gears, water pump, magneto and fan, as well as the power drive pulley. This leaves the entire front end of the engine open for inspection.

To reach the lower part of the engine, the oil pan, which runs the entire length of the engine and transmission case, can be dropped, and then by taking out one nut from each of the front spring points, the entire tractor can be lifted up around the dead axle which acts as the suspension pivot point. This permits the operator to work on the engine in a vertical position. By taking off the main bearings, he can pull out the crankshaft, connecting rods, pistons, clutch shaft, flywheel, and then by taking off the back or transmission cover, all other inner parts of the engine are removable. An example of the practice of using individual parts for two or more purposes is the use of the starting crank as the gear shifter lever. This dual use of the crank entails some incidental advantages. The starting crank cannot be removed from its gear shifting position unless the gears are in neutral. Therefore it is impossible to crank the engine with the gears engaged, and it would be impossible to leave the starting crank in the field, because the gears cannot be engaged unless the starting crank is in shift lever position.

By the use of the unit crank and transmission case a single oiling point suffices for the lubrication of all working parts of the tractor. On the earlier product there is only one grease cup, and this is located on the water pump shaft, but it will be shortly replaced by a packing gland which will do away with the only point requiring attention from the operator. The oil filler is so located that the oil first enters the transmission case and then flows to the crankcase, so there is no possibility of dry bearings in the transmission when starting the tractor after a new supply of oil has been admitted.

The powerplant is a four-cylinder,  $3\frac{1}{4}$  by  $4\frac{1}{2}$  in. unit, specially designed to burn kerosene. On this fuel, 16 hp. is developed at the normal speed of 1330 r.p.m. The maximum brake horsepower is 21. The horsepower at the draw-bar is 9 and the gear ratio to the sprocket is 17 to 1. At 1600 r.p.m., the tractor travels 3 m.p.h., allowing 3 per cent for slippage. The engine is a four-bearing type, there being a large bearing on either side of the double central throw of the shaft. The pistons are three-ring, with a slot below the bottom piston ring land on each side of the piston to provide a drain back to the crankcase. The usual train of transmission gears has been entirely eliminated, as there is only one speed forward and one reverse. Shifting is accomplished by meshing a heavy, straight tooth pinion inside of one or the other of two bevel gears which are so set that they turn in opposite directions from the bevel drive pinion on the clutch shaft.

The steering action on this Cletrac is similar to that on the other model, steering being effected by varying the relative speeds of the two tracks, but instead of gears and screws to tighten the steering bands, a positive cam and roller action is used, making a much simpler mechanism. This new type of brake control utilizes both steering bands and makes unnecessary the addition of a third band and drum for braking. Adjustments for wear are made by turning conveniently located screws which can be reached through hand holes without removing the rear housing cover.

The driving sprocket for the track is located well up from the ground, for protection from mud, grit and sand. The track runs upon a pressed steel frame which is so formed as to provide an inner race for the floating roller chain, which acts as a bearing. The track forms the outer race. Owing to the solid support for the roller chain along the entire length of the tractor at the bottom, there is no sagging of the track in encountering rough going. The frame acts as a solid support and differs from

Sectional views of the gearset showing the differential band type of clutch used to control independently the motion of the two tracks

## PARTS OF THE NEW CLEVELAND TRACTOR

At top—Details of track shoe and floating roller chain.

Center—The crankshaft, above which (at the right) is a sectional view of the starting crankshaft and belt pulley, and (at the left) a detail section of the driving sprocket.

At bottom—Plan and side views of the present steel track frame.

the wheel track support, which permits of some degree of sagging of the track between the wheels over ground inequalities. The use of the floating roller chain, upon which the track moves, eliminates the necessity for lubricating the track. The track shoes are formed cold from hardened chrome steel and are designed to present a continuous solid tractor surface, which is self-cleaning. The tractor is suspended between the two track frames on coil springs at the front end and pivoted on a dead axle at the rear end. The operator is seated so he can conveniently watch the work of his implements, especially in the case of the cultivator. Power is applied to this cultivator from behind, and the operator, sitting on the

tractor, looks ahead at the work rather than straight down to it. By this method, the lateral movement of the cultivating tool, ordinarily limited to a few inches each way, can be made anything desired. A turn of the tractor steering wheel guides the cultivator, and the lifting levers permit adjustment while within easy arms length on either side.

It is claimed that this two-row cultivator can be attached to the Model F Cletrac by one man in 2 min. It has a 30 in. clearance and therefore can be used on corn up to 48 to 60 in. in height. The Cletrac Model F tractor is priced at \$845 and the Cletrac cultivator, which is adapted to it, at \$135, both prices f.o.b. Cleveland.

## Comparative Aircraft Engine Data

CONSIDERABLE data on the fundamentals of aircraft engine design are given in an article by Commander Martinot-Lagarde of the French Army, abstracted in *La Technique Moderne*.

The power of the engines varies between 160 and 600 hp. The outputs even attain 800 and 1000 hp.; the average is 300 hp. The speeds of revolution are comprised between 1400 and 2100 r.p.m., the speeds of the propellers between 1000 and 1800 r.p.m. The mean piston speed lies between 1375 and 2750 ft. p. m. The weight per horsepower varies between 1.75 and 3.2 lb. The use of Vee type and radial engines and of high speeds without gear reduction permit of the lightest construction.

The compression ratio is at least 5 and attains even 6; when it is above 4.7 we have what is known as a super-compression engine which can be used near the ground only when partly throttled. A comparison of two engines, in order to be complete, should be made for the altitude of flying, by taking account of the over-all efficiency of the powerplant. The specific consumption of fuel per horsepower-hour amounts to 0.46 to 0.57 lb.; that of oil to 0.024 to 0.088 lb. The latter factor increases with the number of connecting rods on the same crankpin.

The output per liter of cylinder displacement varies from 11.5 hp. for low speed engines to 19 hp. for high speed engines (5.3 to 3.2 cu. in. per horsepower). The mean effective pressure lies between 113.5 and 135 lb. p. sq. in., depending on the compression ratio and the volumetric efficiency. The flexibility and efficiency of the engine increase if the stroke-bore ratio is increased from 1.2 to 2.

The bores range between 4.75 and 6.70 in. Vee type and radial engines of from 200 to 400 hp. have bores of 4.75 to 5.50 in. In engines of the all in line type of the same output these figures become 5.50 to 6.70 in. With bores of over 6.3 in. the carburetion becomes more difficult. With bores of more than 5.12 in. it is common practice to use four valves per cylinder; in some cases 5 and even 6 valves per cylinder have been used.

The variations of the weight per horsepower of the principal components of the engine are given below for engines whose specific weight ranges between 1.75 and 3.2 lb. p. hp.

Crankcase .....	0.62 to 0.99 lb.
Cylinders .....	0.47 to 0.815 lb.
Crankshaft .....	0.22 to 0.55 lb.
Connecting rods .....	0.084 to 0.176 lb.
Pistons .....	0.100 to 0.264 lb.
Timing gears .....	0.073 to 0.132 lb.
Carbureters .....	0.044 to 0.110 lb.
Magnetos .....	0.088 to 0.176 lb.
Water pump .....	0.009 to 0.033 lb.
Oil pump .....	0.009 to 0.066 lb.

The use of the radial type of construction makes for

the lightest crankcase, connecting rod assembly and distribution gearing. Cylinders of pressed steel in a single piece, or with aluminum water jacket are the lightest. Vee engines of short stroke, having a main bearing between each pair of adjacent throws, have the lightest crankshafts and crankcases. The connecting rods of Vee engines and vertical engines are substantially equal as regards weight.

Helicoidal water pumps are heavier than centrifugal pumps. For the lubrication system the gear pump is lightest and the one most commonly used.

The maximum pressures on the crankpins are of the order of 1420 lb. p. sq. in. On the piston pins one may go to 2550 lb. In Vee type engines the pressure on the crankpins or the pins of the auxiliary connecting rods may attain 2000 to 2500 lb. p. sq. in.

From the standpoint of inertia forces and uniformity of torque, a twelve-cylinder Vee engine has the advantage over a six-cylinder vertical engine of the same output, substantially in the proportion of 4.5 to 7, and it lends itself better to the installation of a speed reducing gear. With eight cylinders and less, if a speed reducing gear is to be used, it is desirable to use a flywheel. The six-cylinder engine is better balanced than the eight-cylinder Vee engine. The ratio between stroke and connecting rod length varies between 1.7 and 2; the largest values are found in Vee engines.

The best type of valve seat from the point of view of easy passage of the gases is that having an angle of 30 deg.; the diameter of the valves is of the order of 0.45 of the bore and does not exceed  $2\frac{3}{8}$  in.; the lift is of the order of 0.394 in., the maximum being 0.55 in.

The working stress in the crankshaft is of the order of 15,500 to 31,000 lb. p. sq. in., with a tensile strength of 115,000 lb., an elastic limit of 100,000 lb., an elongation greater than 12 per cent and a resilience greater than 10. The bearing diameters for a 300-hp. engine are of the order of  $2\frac{3}{8}$  in.

Oiling pressures are generally about 15 lb. p. sq. in. They attain 75 lb. in high speed engines with narrow bearings like the Hispano-Suiza.

Aluminum pistons are superior to cast iron pistons; the masses and the clearances must be well distributed; the copper content should be about 5 per cent and that of zinc nil. For each altitude and each type of engine there is an optimum compression which depends upon the temperature of self-ignition, the resistance of the spark plug insulator and of the spark plug joints, as well as upon the metal of the exhaust valves. In order to insure good carburetion with the present induction system it is necessary to have gas speeds corresponding to 12 in. of water column. The durability of the engine is the greater the lower the speed of rotation (below 1800 r.p.m.) and the lower the bearing pressure.

# British Daimler to Produce New Four-Cylinder Chassis

Has  $3\frac{1}{2} \times 5\frac{1}{8}$  in. Knight engine with pair-cast cylinders, Lanchester vibration damper, single plate clutch, worm-drive axle, and 132 in. wheelbase. Four-point body mounting minimizes effect of frame distortion.

By M. W. Bourdon

**F**OR some years past the Daimler Company has specialized in six-cylinder cars of 30 and 45 h.p. respectively, but to meet the current demand for less expensive chassis a new model has just been introduced to supplement the existing types for 1922. It has an engine termed 20 h.p., with four cylinders  $90 \times 130$  m.m. ( $3\frac{1}{2} \times 5\frac{1}{8}$  in.).

As with all Daimler engines produced during the past fifteen years, Knight sleeve valves are used. The cylinders are cast in pairs with the silent chain distribution located between rear end of crankcase and flywheel. Separate detachable heads are used. At the front end of the three bearing crankshaft the Lanchester vibration damper appears as on the six-cylinder engines. In front of the casing is a grooved pulley driving the combined fan and generator shaft with a hinged mounting of the generator for belt adjustment. A separate engine starting motor operates through a Bendix drive. Water circulation is by pump, driven by a transverse shaft which drives the magneto at the opposite end. Cast iron pistons are used. The wrist pins are clipped in the small end of the connecting rods and float in the piston bosses.

Engine lubrication is on the trough system, with five independent plunger pumps, one for each trough and the fifth for supplying the main bearings and the worm driving gear of the front transverse shaft.

The carbureter is of the Daimler type, the 7 jets coming successively into operation automatically by the negative pressure lifting a series of steel balls. Vaporization is assisted by water jacketing the induction manifold. Fuel is fed by a vacuum tank; this represents a departure for Daimler.

Another departure is the use of a single plate clutch instead of the cone type. Three external multiplying levers are used for clutch operation, the springs being internal and operating directly upon the clutch plates. Fabric disk joints are used at each end of the tubular shaft between engine and the four-speed gear-set. The latter has a three-point suspension, while the engine is secured at four points directly to the main frame. Engine and gear-box are considerably inclined.

The rear axle has a Lanchester worm drive below with

a ratio of 4.125 to 1. The axle casing is built up from a three-part aluminum center and extension tubes, with adjustable truss rod. Detachable wire wheels,  $32 \times 4$  in., are fitted; straight side cord tires will be standard on cars for export and also, later on, on all chassis of this model.

Previous Daimler practice is also departed from in the rear wheel brakes. These, although still operated by pedal, are of the internal instead of external. The transmission brake is of the band type, lined with metal segments, and operated by the push-on side lever. The suspension is by three-quarter-elliptic springs at the rear and semi-elliptics at the front. Rear springs are underslung, a feature which, it is asserted, has almost eliminated the tendency toward rolling which occurred when the springs were mounted above the rear axle casing.

The new chassis is designed to take the same length body as the larger models, and therefore has a wheelbase considerably greater than usual in cars of this power, namely 132 in.

The standard bodywork at present consists of an open touring model and a landaulet. Both types are comparatively narrow, allowing a rear seat wide enough for two persons only; but purchasers of the touring car will have the option of either two additional folding seats or no folding seats and a rear windscreen. The latter is being specially made by the Daimler Company, and will, when out of use, fold neatly so as to appear as the rear panel of the front seat.

The bodies are mounted on the chassis so as to take bearing at four points only and thus prevent frame flexion from distorting the superstructure. At the front the bodies are secured by two hinge bolts, while the rear supports consist of two large circular rubber buffers with a central locating pin to each.

The chassis price is £750 (say \$3,700) and the open touring car £1,050 (\$5,200).

**T**HE American Wood Preservers' Association has established a Service Bureau which will answer inquiries and furnish information regarding the treatment of wood and the use of treated lumber. The Service Bureau is located at 1146 Otis Building, Chicago.

# Show Time Finds Canadians Widely Interested in Automobiles

Sales stimulation noted at National Exhibition, but return of aggressive buying power will be slow. American tariff action increases advantage of Canadian-made cars and is affecting improvement of Dominion business conditions, which have much of encouragement in them.

TORONTO, Sept. 5.

**T**HE motor show of the Canadian National Exhibition, which has always been regarded by Dominion automotive men as an indicator of the next season's market, is being studied this year with more than usual care. Not that its students expect it to yield a complete forecast of what may be expected during the next six months—there are too many uncertainties in Canadian political and business conditions for that. But the men in the automobile, truck and equipment businesses count on the show to provide at least a fairly good telescopic view of the buying sentiment of the Canadian public and the number of high executives—manufacturers, branch managers, distributors and dealers—who are watching the drift of people in and out of the Transportation Building and listening to their conversation is greater than in former years.

In attendance, the exhibition, which began its second and final week to-day is going to surpass all others unless unfavorable weather develops in the closing days. The previous attendance record is a million and a quarter. Approximately 600,000 persons had passed through the gates when the first week was concluded Saturday night and with to-day—Labor Day in Canada as well as across the line—offering ideal weather and a crowd of more than half a million, the most conservative estimators fix the 1921 aggregate attendance at a million and a half. Of these people, half will pass through the Transportation Building, which houses passenger cars—an interest in automobiles which promises well for the future of motor transportation in the Dominion.

Throughout the first week the automotive men found some buying at the exhibits of cars and a better than casual interest in trucks, shown in tents, and automotive equipment, displayed in one of the old barracks of the war-time period. But trucks and accessories were hardly in the show, practically speaking, because the crowds are used to milling through the great permanent buildings that make this exhibition one of the world's wonders.

The automotive men found some buying of passenger cars, but the general attitude of the public through the first half of the show was to shop around. This gave the Toronto dealers' salesmen manning the booths opportunity to fatten their prospect lists, which promises healthy activity and some sales results during the fall months. But the undercurrent of sentiment, as careful observers noted it at the show, is one of strict economy. There are too many problems of readjustment still confronting the Canadians to warrant anything more than a slow, gradual return of freer investing in such commodities as automobiles.

Show time finds several of the Canadian manufacturers doing some commendably energetic things to stimu-

late the latent desire of every normal man or woman to own a new motor car. These things the Canadians are doing are likely to be more than interesting to American manufacturers. They may contain some practical suggestions for stirring up a sluggish automobile market.

General Motors of Canada has in the show the new McLaughlin (equivalent of Buick) four. Chevrolet has specials both in the FB and 490, the latter job, in particular, being an aggressive bidder for business with an imposing list of special attractions at only \$95 more than the stock job list price. On this 490 special are a front bumper, nicked radiator, lowered steering wheel and seats (one inch), seat side arms flush with side of body, gas tank at rear, green paint with gilt striping and quite a few other features that are causing talk at the show.

Willys-Overland of Canada also has a special Overland four, with a composite body and some other merchandising features that have made it a center of attraction.

The Canadian cars cost more here than American cars of the same name sold across the border, considerably more in some cases than can be accounted for in the duty on raw materials and parts, the difference in exchange and the higher cost of production per unit due to smaller production totals, but in quite a few even conventional particulars the Canadian cars are better made, especially as to body and top finish. Yet the Canadian manufacturers have not had to wait for lessons from the makers in the States to see the possibilities of sales stimulation in special jobs and fittings.

When the Canadian manufacturer or the American manufacturer who is sending cars into Canada goes into a study of his market for the rest of 1921 and 1922 he finds a good many factors that make definite forecasts difficult. Yet some things are quite apparent. They might be enumerated:

1. Canadians are leaning even more strongly than they were a year or a few years ago toward the Canadian-made car. You would hardly say they are resentful, but plainly they are disappointed over the American attitude as expressed in the American emergency tariff, which has raised a little higher the wall of import duties over which leading Canadian products, such as grains, livestock and lumber derivatives, must climb to reach the American markets.

2. The farmers, generally, won't have much money to spend until after the harvest of 1922. They owe most of what the current crops will yield and they must borrow again, in some cases this fall, in others next spring, to carry on their work.

3. There will be sporadic bursts of buying, in which motor cars particularly will profit, but the re-

turn of healthy buying power will be slow—some of the bankers predict it will become weaker before it gets stronger.

4. The failure of the hay crop in Quebec and eastern Ontario and the collapse of the livestock market are offset by the normally good yield of wheat in the great prairie provinces of Manitoba, Saskatchewan and Alberta.

5. The blow to manufacturing by the crippling of export demand is softened by the fact that the bulk of Canadian manufactures are for home consumption and Canadian business, following the curve of that in the United States, is steadily improving.

6. Canada's recovery from the difficulties imposed by the readjustment will follow the recovery of the United States unless the American Congress, on which all eyes are turned in the Dominion, erects a still higher tariff wall in the way of the natural flow of the great mass of Canadian agricultural, livestock, fisheries, fur and manufactured products.

7. Money is comparatively "easy." Credit is readily available for legitimate enterprises, and just now some dealers who were using acceptance corporations to finance stocking of cars are having them shipped on sight draft, indicating that the banks are financing them direct.

The effect of American tariff legislation is one of the chief topics of conversation among well-informed Canadian business men. They are frank to say that Canada's return to prosperity will not be able to follow the return across the border if Canada is forced to search elsewhere for markets, which naturally would take time and seriously injure Canadian business while the searching process was going on.

Just now Canada is upset, and she will be more or less upset the remainder of the year, over the impending general election, called by Premier Meighen on the protective tariff issue. Meighen stands for protection and has decided to stake his government on the question.

As in the past, makers of cars sold in Canada, whether Canadian, American or European, will find high prices and poor roads restricting factors. The Dodge, for instance, whose touring car price is \$985 f.o.b. in the States, is listed at \$1,615 here. And the Maxwell, \$845 in the States, is \$1,250 here. Dodge has to come into the Dominion as a completed vehicle, paying the full 35 per cent import duty; Maxwell is manufactured at Windsor. Yet the difference in Canadian over American price is only the difference between 58 and 61 per cent. Chevrolet in Canada has kept its price within less than 40 per cent over the American figure, but some cars made either in the States or the Dominion, particularly in the high-priced classes, run upward of 70 per cent higher. Motor wise Canadians know these things and some of them have foregone automobiles on the out and out objection to the price differential, regardless of its justice. To the greater number, however, under present conditions it is just a question of buying power, which obviously is not going to be quite so active in the face of the Canadian differential.

Quebec leads in good roads and Ontario, with an appropriation of \$10,000,000 this year and the aggressive better highways man, F. C. Biggs, in charge, is coming right along with roads encouraging for automobile traffic, as are some of the other provinces. Biggs talked to the automotive men and directors of the Exhibition at one of the noonday luncheons in the Administration Building and told them that Ontario would have completed this year 75 to 100 miles of permanently improved highway and 600 to 700 miles of good gravel roads. Biggs proved

to be an enthusiast for motor truck transportation and said he was working "from the bottom up" to build roads fit for trucks. F. W. Fenn of the truck section of the National Automobile Chamber of Commerce, told the Canadians of the development of motor freight transportation in the United States and of its possibilities on the North American Continent.

As to the competition which American and Canadian manufacturers may look forward to from Europe, the indications are plain that the British manufacturers, in particular, will make a strenuous effort to regain some of the ground lost when military restrictions stopped their shipments to the Dominion in the three years before the United States entered the war. The Canadian disappointment over American tariff legislation, previously mentioned, is augmenting the interest shown in the British cars at the exhibition—Vauxhall and Austin. They are costly, of course, Vauxhall being listed at something around \$6,000, while Austin sells for \$4,800, yet they compare quite favorably with the prices of American cars in their classes when the differential imposed by the tariff and loss in exchange are considered.

This attitude of the Canadian toward American products, in fact, deserves attention by American business men who are consulting and being consulted by members of Congress in connection with the framing of the new tariff. The attitude has been repeatedly put into words by well-informed Canadian business men canvassed by dealers as prospects for cars, particularly in the medium and high-priced classes. The Canadian business man shows his interest in the American car—and, of course, if his interest is strong enough he buys it, which is often the case, tariff or no tariff—but sometimes he counters with his feeling, and that of many of his neighbors, that perhaps he is not quite justified in passing his money on to an American manufacturer. He tells the dealer that the United States has been selling goods to Canada at the rate of almost \$800,000,000 a year and buying from Canada in only half that amount, yet the United States adds to its restrictions upon the flow of Canadian goods to America. He reads the advertisements of the big Canadian stores of goods "Made in Canada," a sort of campaign which has been highly popular of late, and he thinks a little more than he might otherwise about cars manufactured in Canada or England, which, of course, is favorable to the Canadian manufacturer, who in virtually all cases is an auxiliary or associate of an American corporation with the same or a similar name. One exception to this rule at the show is London Motors, Ltd., of London, Ont., which shows one of the first cars made under the London name.

A canvass of the truck situation coincident with the show reveals a not unexpected condition, in view of general conditions and the comparative infancy of the truck business in the Dominion. An aggressive distributor of several lines who sold 3000 cars in the fiscal year ending Sept. 1, disposed of only 30 trucks, an extreme condition perhaps, yet one which gives some indication of the stagnation of truck business. In so many sections roads are unfit for any but light trucks and in so many others the truck idea has hardly a foothold that the truck men of the Dominion must go through a long pull of educational and sales work before they get into real momentum. That they are not discouraged is shown by the appearance of 22 truck firms at the Exhibition, despite the unfavorable condition of housing in tents.

The United States, England and Italy are represented in the truck section, in addition to those exclusively Canadian products: H. & K., Harmer & Knowles, Toronto; Mapleleaf, Mapleleaf Mfg. Co., Montreal; National, National Steel Car Corp., Hamilton, Ont.

# Producer Gas as a Fuel for Automotive Vehicles

## Part I

The possibility of operating truck or similar internal combustion engines on gas derived directly from coal is here considered from theoretical as well as from practical angles, while the basic principles of operation of the producer and its auxiliaries are briefly outlined.

By P. M. Heldt

**I**N a report issued about a year ago by a Committee on Motor Fuels of the British Fuel Research Board the view was expressed that that country must depend mainly upon its coal deposits for fuel for its motor cars and other automotive apparatus in the future. There are no oil wells in Great Britain. The shale deposits of Scotland do not seem to be very promising and the only other obvious liquid motor fuel would be alcohol produced from starchy vegetable material, which probably would have to be specially grown for the purpose and would therefore prove quite expensive. Coal, on the other hand, is available in abundance.

The heat energy of coal can be used as the propelling agent of internal combustion motor vehicles in any one of three different ways. In the distillation of coal certain liquid products are obtained, one of which is sold under the name of commercial benzol and forms an excellent motor fuel. With benzol used in an automobile engine the fuel consumption is usually somewhat less than with gasoline, and as the benzol does not cause knocking of the engine at much higher compression than is practical with gasoline, the compression ratio of the engine can be raised and thus the power output increased.

The second method consists in using coal gas as the fuel, the gas being carried along on the vehicle in either a collapsible bag or in a steel bottle under high pressure. This method, with collapsible bags, was employed in England to quite an extent during the war. Its disadvantages are obvious. The third method consists in fitting the vehicle with a gas producer operating on the same principle as producers for stationary power plants, and producing fuel gas as needed as the vehicle proceeds.

### The Weight Problem

Upon an inspection of a stationary producer plant it may appear doubtful whether such a device can be built sufficiently light to permit of its installation on a vehicle, but a review of the history of weight reduction of internal combustion engines gives rise to the highest hopes in this respect. For instance, a single cylinder 60 hp. Otto gas engine running at 210 r.p.m. weighed 25,000 lbs., or more than 400 lbs. per hp. A modern automobile engine weighs little more than 10 lbs. per hp. and an aircraft engine of the lightest type, operating on exactly the same basic principle as the above mentioned Otto engine, weighs less than 2 lbs. per hp. It is quite reasonable to expect that gas producers when specially designed for purposes where lightness is essential, can be reduced to a small fraction

of their normal weight in the stationary form.

The idea of using producer gas as a fuel for motor vehicles, and particularly for motor trucks and tractors, is by no means new. The greatest amount of development work along this line has been done in England, largely, no doubt, by reason of the gasoline shortage in that country during the war and the comparatively high prices of motor fuel there after the war. It is hardly to be expected that in this country, so long as liquid petroleum fuels sell at anywhere near present prices, there will be a demand for a substitute fuel that is materially less convenient and whose use results in a reduction of the engine power. But in countries where the price of gasoline ranges very high and coal is available, producer gas would seem to have a good chance.

### The Producer Process

Producer gas is made from coal in a simple manner. A vertical furnace lined with fire-brick, with openings at both top and bottom, is filled with coal to a considerable depth, the coal resting on a grate. The bed of coal is kindled at the bottom and air is drawn or blown through the furnace, causing a hot fire in the lower part. The combustion of the coal in the lower part of the furnace produces carbon dioxide, but as the latter rises and comes in contact with a layer of coal which cannot burn because of the lack of oxygen, it combines with additional carbon and forms carbon monoxide. It is this carbon monoxide which forms the chief combustible element in producer gas. When made from hard coal in the manner outlined the gas contains about 32.3 per cent of carbon monoxide, 1.6 per cent of carbon dioxide, 4 per cent of hydrogen, 61 per cent of nitrogen and 2 per cent of marsh gas.

That a gas of this character has only low calorific value may be readily seen, as the bulk of it is nitrogen, an inert gas. The heat value of producer gas is given as 72 B.t.u. per cubic foot. The gas can be made from coke, but is then slightly leaner, the average composition being 29 per cent carbon monoxide, 4 per cent carbon dioxide, 2.5 per cent hydrogen and 64.5 per cent nitrogen.

### Water Gas

In the development of gas producers various methods of creating a draft of air through the fuel bed were tried. One way was to use a blower and force the air through, and another to draw it through by suction, as, for instance, by directly connecting an engine to the producer. Later on a steam jet was introduced for creating the draft, and

this had a marked effect on the quality of the gas produced, as the steam, when raised to the high temperature of the incandescent fuel, would dissociate into hydrogen and oxygen. The oxygen thus set free combines with carbon to produce carbon monoxide, while the hydrogen remains in the uncombined state and adds materially to the heat value of the fuel. It might be thought that there would be no gain in the heat value in the gas obtained from a given quantity of coal or coke, because the heat absorbed in the dissociation of the steam is equal to the heat later given out by the combustion of the hydrogen in the gas. However, when steam is injected, it seems that more of the heat of the incandescent fuel is absorbed within the producer and less is radiated, and in consequence the efficiency of the whole producer increases from about 70 per cent without to between 80 and 90 per cent with steam injection. Besides, when no steam is injected, every pound of oxygen required for the combustion of coal to carbon monoxide and carbon dioxide carries with it  $3\frac{1}{2}$  lbs. of nitrogen, which has no heat value and acts merely as a diluent. The oxygen derived from steam does not carry this diluent and the gas therefore is relatively richer. At the present time the injection of steam or vapor is a common practice in producer work.

#### Coolers and Dust Extractors

Gas produced from hard coal or coke carries with it a good deal of fine dust, which must be separated out if the gas is to be used in an engine; gas from coal in addition carries much tarry matter and this must likewise be separated out before the gas can be used in an engine. The former operation is performed in a dust extractor which usually operates on very much the same principle as dry air cleaners on farm tractors. That is, the gas is drawn through a chamber in which it is subjected to a spiral or other curvilinear motion, so that the heavier dust particles separate out at the bends and collect at the bottom of the separator, from which they can be removed at intervals, while the cleaned gas leaves the apparatus on top.

Before the tarry matter can be extracted from the gas the latter must be cooled, for upon leaving the producer the gas is very hot and some of the tarry materials are in a gaseous state. Cooling is effected by bringing the gas in contact with tubes through which cold water runs, or else directly into contact with a cold water spray. Sometimes the dust separator is combined with the cooler.

#### Scrubbers

The apparatus used for removing the tarry material from the gas is known as a scrubber. It takes quite a variety of forms. Sometimes there are counter currents of gas and water spray, and in other devices the gas is allowed to bubble up through water and then pass through a bed of pebbles, coke, sawdust, asbestos wool, etc., these materials being preferably kept moist so the tarry materials will adhere to them. One great difficulty that must be overcome in the design of a producer outfit for motor truck use is to keep the size of the scrubber within practical limits, as in stationary work the scrubber is usually larger in dimensions than the producer itself.

#### Advantages and Disadvantages

As already noted, the use of producer gas on motor trucks would be considered chiefly in countries where petroleum products sell at high prices, and the chief advantage would be the saving in fuel cost. There are, however, a number of other minor advantages. For instance, the fire hazard connected with the vehicle is much less if the fuel supply is in the form of coal or coke, and lower insurance rates could no doubt be obtained on both the vehicle and the garage. Distribution troubles would be

entirely eliminated and there would be no crankcase dilution. As regards fuel costs, it has been calculated that producer gas at \$8.00 per ton of coal is equivalent to gasoline at 9 cents per gallon.

To offset these advantages there are a number of disadvantages. With a gas producer the truck is not instantly ready for a trip at any time. To heat up the producer and get it into working condition takes about 20 minutes. The scrubber requires a cleaning every day, but this can be done while the fire is being lighted and therefore need not involve any loss of time. Not only does the fuel (and water) required to cover a given distance weigh approximately twice as much as with gasoline, but the weight of the producer and scrubber, which varies from 250 to 400 lbs. for a 3-ton truck power installation, is almost completely additional weight, as the only thing replaced on the gasoline truck is the carburetor, which represents only a very small fraction of the above weights.

#### Difficulties of the Producer Problem

If we start with a gas producer as used in stationary work many difficulties are encountered in automobile practice, and these are well summarized by D. J. Smith in a paper presented to the Institution of Automobile Engineers. Mr. Smith says:

"A producer of this type depends entirely for its satisfactory working on the care and attention given by the man in charge. It has no moving or mechanically operated parts. The fire having been lighted, fuel is fed into the producer by the attendant until the hopper is full. Only a thin layer of the fuel is burning at the bottom, the remainder of the fuel above this being exposed to the full heat of the fire, and all the hot gases are drawn up through it. If there are any volatile constituents in the fuel—and even in good anthracite there is a certain proportion—this is the best possible method of distilling them off, but the worst possible method for direct use, as any portion of these volatile constituents would gum up the engine; a very large scrubber has therefore to be fitted, in order to eliminate them, and this requires a large quantity of water, usually about  $1\frac{1}{2}$  gallons per b.-hp. per hour. It will thus be clear that if a producer which is liable to give off tar or volatile matter is used on a motor vehicle, it would not be practicable to fit a scrubber large enough to deal with the gas efficiently, nor would it be possible to carry the quantity of water required for anything but a very short run.

#### Ash Removal and Compacting of Fuel Bed

"As the fuel is consumed, a layer of ashes is deposited on the bars which, unless periodically removed, deadens the fire and the production of gas falls off. To remove these ashes, a firedoor has to be opened so that they may be raked out by the attendant, and this has to be carried out quickly, or air will enter which may stop gas production or cause an explosion in the producer.

"The deep bed of fuel also burns hollow, which tends to stop the full gas production. If this is knocked in by the attendant, the resulting disturbance generally destroys the production of gas so that the engine stops, and the producer has to be fanned up to get it to work again. The poking of the fire, to destroy or prevent these hollows, has to be carried out by the attendant through small holes normally closed by plugs, and as it is impossible to see what is happening, it is not a very efficient operation.

"The feeding of the fuel is performed by hand, and the fuel passes through an air lock, as it is essential that no air be allowed to leak into the generator during the operation. If, as occasionally happens, the attendant leaves both doors of the air lock open, either the engine stops or an explosion occurs. With fuel fed in this manner, it is

quite obvious that there is at one time too much fuel in the producer, and at another too little. In any case, there is no connection between the quantity of fuel fed and the work that is being done, and, therefore, the quality of the gas must be very variable.

#### Water Feed

"The supply of water to the producer is a most important point, in view of the part played by the water vapor in the composition of the gas. The control of this is generally left to the attendant, who regulates it without anything to guide him as to the quantity required, though in one or two cases the suction of the engine is made to control the feed of water, but even here there is no definite regulation.

"The inflexibility of the ordinary producer is bound up with the lack of control of the water supply and the form of fire bed used. If it is assumed that a producer is working on a steady load, air is being drawn over the surface of the water in the vaporizer and takes up a certain quantity of steam. If the load is suddenly increased, more air would pass over the water, but no increase of steam would be available; in fact the tendency would be to cool the water down and decrease steam production. The gas would therefore be of lower quality, and the engine, instead of responding to the increased load, would stagger and possibly stop. Even if the steam were available, the fire, possibly with a layer of ashes between it and the bars and a bed of dead fuel above it, cannot respond rapidly, and would be cooled out by the sudden increase of steam drawn through it, and the quality and quantity of the gas would be still further reduced."

#### Air Required for Combustion of Producer Gas

It has long been known that a stationary engine running on coal gas generates less power than the same engine operated on gasoline, and the same is generally true of all engines operating on gaseous fuel. The chief reason is that these fuels occupy a considerable space in comparison with the air required for their combustion, whereas the space occupied by gasoline vapor in a perfectly proportioned mixture is less than 2 per cent. Moreover, the reactions are entirely different in the gas engine than in the gasoline engine. In an engine operating on producer gas the bulk of the heat generated is due to the combustion of carbon monoxide into carbon dioxide. From the composition of the producer gas it is possible to calculate the volume of air required to completely burn a certain volume of the gas, and thus the ratio of volumes can be found. Let us take a producer gas having the following composition:

Carbon monoxide .....	25 per cent
Carbon dioxide .....	5 per cent
Hydrogen .....	19 per cent
Marsh gas .....	2 per cent
Nitrogen .....	49 per cent

By Avogadro's law equal volumes of gas at equal pressure contain the same number of molecules. In the combustion of the gas one molecule of carbon monoxide combines with one atom (or one-half molecule) of oxygen; one molecule of hydrogen combines with one-half molecule of oxygen and one molecule of marsh gas combines with two molecules of oxygen. The volume relations of the combustion therefore are as follows:

or 102 parts of burned gas. In the table all figures represent parts by volume.

The above would be the reaction if the gas were burned in pure oxygen. However, the gas is burned in air, and the oxygen forms only 21 per cent by volume of atmospheric air. The other 79 per cent are inert gases, mostly nitrogen.

Hence, instead of 26 parts of oxygen combining with the fuel,

$$26 \times \frac{100}{21} = 119 \text{ volumes of air}$$

combine with it, and the products of the combustion of 100 parts of gas in 119 parts of air form 195 parts by volume. Thus the gases occupy less volume after combustion than before, when reduced to the same temperature and pressure. This is the reverse of what takes place when gasoline vapor is burned.

Calling the capacity of the cylinder (the piston displacement) 100 per cent, the fuel of a properly proportioned charge occupies

$$\frac{100 \times 100}{100 + 119} = 45.7 \text{ per cent}$$

and the air,

$$\frac{100 \times 119}{100 + 119} = 54.3 \text{ per cent,}$$

while the products of combustion occupy

$$\frac{195}{100 (100 + 119)} = 89 \text{ per cent.}$$

#### Air Required for Combustion of Gasoline

A little calculation will show how different the relations are in the case of gasoline fuel. Octane may be considered as typical of present-day gasoline. Its combustion reaction is

One volume of gasoline gas + 12.5 volumes of oxygen = 17 volumes of burnt gas.

For the combustion in air we require

$$12.5 \times \frac{100}{21} = 59.6 \text{ volumes of air,}$$

containing the 12.5 volumes of oxygen required together with 47.1 volumes of nitrogen and other inert gases, and the equation of the combustion reads

1 vol. of gasoline gas + 59.6 vol. of air = 64.1 vol. of burnt gas. Or, calling the cylinder volume 100 per cent,  
1.65 vol. of gasoline gas + 98.35 vol. of air = 105.7 vol. of dead gas.

#### Heat Energy of Combustible Mixtures

Now, the power which an engine can develop does not depend solely upon the amount of air which the cylinder can draw in during each cycle, but also upon what this air is used for. A different amount of heat is liberated per unit volume of oxygen used for each of the different chemical reactions. The amounts of heat generated per pound of oxygen consumed in the different reactions are as follows:

Carbon to carbon dioxide, 5,300 B.t.u.

Carbon monoxide to carbon dioxide, 7,670 B.t.u.

Marsh gas to carbon dioxide and water vapor, 6,030 B.t.u.

Hydrogen to water vapor, 6,560 B.t.u.

The total amounts of oxygen available in the cases of the producer gas engine and the gasoline engine are 54.3 and 98.35 volumes respectively. In the case of the producer gas engine 12.5/26 of the entire amount of oxygen is used for converting carbon monoxide into carbon dioxide; 9.5/26 for converting hydrogen into water vapor; and

4/26 for converting marsh gas into carbon dioxide and water vapor. The heats of the various components of the fuel therefore figure out as follows:

Carbon monoxide	$54.3 \times (12.5/26) \times 7,670 = 200,000$
Hydrogen	$54.3 \times (9.5/26) \times 6,560 = 130,000$
Marsh gas	$54.3 \times (4/26) \times 6,030 = 50,400$

Total	380,000
-------	---------

In the case of the gasoline engine we have 98.35 volumes of oxygen available. Two-thirds of this oxygen are used to convert carbon into carbon dioxide and one-third is used to convert hydrogen into water vapor. The heats of reaction are therefore as follows:

Carbon	$98.35 \times \frac{2}{3} \times 5,300 = 347,000$
Hydrogen	$98.35 \times \frac{1}{3} \times 6,560 = 215,000$

Total	562,000
-------	---------

From this must be deducted about 2 per cent for the heat of formation of the gasoline; that is to say, before the gasoline can be transformed into carbon dioxide and water vapor it must be broken up into carbon and hydrogen, and this requires a certain amount of heat energy.

562,000 — 2 per cent = 550,000 B.t.u.

Therefore, the heat energy in a cylinder full of gasoline vapor-air mixture bears to the heat energy in a cylinder full of producer gas-air mixture the proportion

550,000 : 380,400

or 100 : 69.4

#### Increased Compression Possible

This latter figure represents the relative amount of power which can be expected if the producer gas is used in a gasoline engine without any change in the compression. However, as there is no knocking with producer gas at ordinary compressions, it is quite possible to increase the compression, and compressions of 125 lb. per sq. in. are considered practicable. In other words, instead of a compression ratio of 4, commonly used in gasoline engines, we could use a compression ratio of 6. The theoretical efficiency varies according to the equation

$$e = 1 - \left(\frac{1}{r}\right)^{0.3}$$

and as the amount of fuel charge drawn in would be independent of the compression ratio it is reasonable to assume that the output would increase in the same proportion as the efficiency.

$$1 - \left(\frac{1}{4}\right)^{0.3} = 0.341$$

$$1 - \left(\frac{1}{6}\right)^{0.3} = 0.341$$

With such an increase in compression in the producer gas engine the powers of the gasoline and gas engine therefore would be to each other as

$$100 \times 0.341 : 69.4 \times 0.416$$

or as 100 : 84.7

Consequently, even with very high compression, only about 85 per cent as much power can be expected from the producer gas engine as from the gasoline engine, and at the same compression, only about 70 per cent. It should be pointed out, however, that the gas made the basis of this analysis is so-called water gas, containing a considerable proportion of hydrogen. With producer gas made without steam injection the engine output drops to about 50 per cent.

#### Comparisons Made By Fuel Committee

During the war a committee of the British Fuel Petroleum Executive was formed to look into the practicability of using various gases as substitutes for gasoline in motor vehicles. In the report of this committee it was stated that 250 cu. ft. of free coal gas was equal to one Imp. gal. of gasoline (200 cu. ft. = 1 U. S. gallon), the gas containing from 490 to 500 B.t.u. per cu. ft. This evidently allows for a slightly higher thermal efficiency with the gas, because one gallon of gasoline (6 lbs.) contains 115,000 B.t.u., whereas 200 cu. ft. of gas of 490 to 500 B.t.u. per cu. ft. would have only 98,000 to 100,000 B.t.u. With portable suction gas plant, the report states, a performance of 1.8 ton-miles can be obtained per pound of coke and 2.2 ton-miles per pound of hard coal. The report also stated that an ordinary motor vehicle engine, unaltered structurally, when operating at between half and full load, would do 91 per cent the work on coal gas of 450 B.t.u. per cu. ft., 87 per cent the work when operating on producer gas of 210 B.t.u. per cu. ft., and 82 per cent the work when operating on producer gas having 140 B.t.u. per cu. ft., as with gasoline. It was figured that with hard coal at 55s. per ton and gasoline at 3s. 8½d. per Imp. gal. the fuel cost per ton-mile was only one-twelfth as much with producer gas as with gasoline. This comparison probably does not take account of the fact that when a truck is standing the engine operating on producer gas must be kept running in order to keep the gas producer going, and when operating at very slow rates the efficiency of the producer is undoubtedly quite low. All fuel consumption of the machine, therefore, does not stop with the shutting down of the truck, as it normally does in the case of a truck operating on gasoline.

(To be continued)

## Standardizing Radiator and Bumper Fittings

THE present Society of Automotive Engineers standard for radiators specifies inlet and outlet flanges identical in dimensions to the S. A. E. standard two-bolt carbureter flanges. It also specifies that the fittings themselves shall be cast separate from the radiator tanks. If the radiators are shipped with the fittings cast on there is danger of their breaking off during transportation and the automobile and truck manufacturers can purchase them to better advantage than the radiator manufacturers because they are purchasing a larger amount of castings.

As it seems desirable to have a standard for these fittings so that they can be sold as a standard part, a tentative specification for water-pipe fittings has been laid out, using the dimensions specified by the S. A. E. Radiator Division for the pad dimensions and the dimensions for the length of fittings and the outside diameters specified in the present S. A. E. standard for rubber hose

clamps and fittings. Blue-prints of this tentative proposal have been mailed recently to radiator manufacturers and users for their criticism.

#### Automobile Bumper Mounting

The passenger-car manufacturers have been circularized by the S. A. E. requesting their opinions as to whether or not the standardization of a plain bolted-on bumper connection would, if adopted by the Society, be generally adopted in future passenger-car practice.

The replies to this general letter indicate that twenty-one out of twenty-four companies, or 90 per cent, believe that such standardization is most advisable.

It is expected that the Subdivision on Automobile Bumper Mountings will be able to submit a preliminary recommendation at the September meeting of the Parts and Fittings Division.

# The Influence of Various Fuels on Engine Performance

## Part VI

In this instalment the author outlines tests intended to determine the conditions which govern ease of starting with various fuels, and the effect of the fuel upon the volumetric efficiency, as well as upon distribution in multi-cylinder engines. Gasometer is used for air measurements.

By H. R. Ricardo\*

IT is proposed in this article briefly to examine the conditions governing ease of starting, distribution and volumetric efficiency, and to consider in what ways these conditions react favorably or otherwise toward one another.

### Starting

Ease of starting must be considered from two different aspects, namely, (1) the ease with which an engine can be induced to start running under its own power, and (2) the time taken to warm up sufficiently to give full power.

It is common experience that while a motor-car engine can be started up with ease it may take as much as five or six miles running before the engine will "pull" well, more particularly when the carbureter setting is such as to deliver a rather weak and therefore an economical mixture.

The conditions governing the ease or otherwise of gaining the initial start will be considered first. They have proved extraordinarily difficult to determine because so many factors enter into the case, such as the condition of the sparking plugs and the strength of the spark, which has usually to be provided from a magneto running at a very low speed, and also the speed at which the engine is rotated.

To start an engine from cold it is necessary to have present in the cylinder at the time of ignition a sufficient proportion of vapor to form an explosive mixture. The formation of this vapor must be effected notwithstanding the fact that not only the whole of the induction system but the cylinder walls, pistons, and valves are all quite cold, and also that the velocity in the induction system is at a minimum.

If, at starting, the carbureter were supplied only with a mixture of strength just sufficient to give good economy under normal running conditions, the engine would certainly never start from cold with even the most volatile gasoline. On the other hand, if an excessive quantity of liquid fuel be admitted to the cylinder, or it is spread over the internal walls of the induction system, the large surface of liquid thus exposed will allow a sufficient quantity of the more volatile fractions, even of the least volatile of the present day gasolines, to evaporate and so produce a combustible mixture. Even in cold weather, therefore, it is possible to start an engine from cold with any reasonable fuel.

From these considerations the following conclusions may be drawn:

(a) On no gasoline will an engine start from cold with an economical mixture strength.

(b) On commercial gasoline an engine will start from cold provided sufficient fuel of reasonable quality is admitted.

In all fuels belonging to the group known as gasoline, some of the light fractions, which occur in the majority of crude petroleums, exist. These light fractions consist either of hexane, cyclohexane or benzene and often of all three of these substances. Even in the least volatile gasolines these light fractions are present to some extent, and their presence renders starting from cold possible.

In all modern carbureters some means, such as a pilot jet, is provided in order to deliver a very rich mixture for starting and slow running, and this is generally supplemented by flooding when starting from cold. How much flooding is required depends primarily upon the arrangement of the induction system. When the induction pipe is of large diameter so that when turning by hand the velocity through it is very low, and when the carbureter is fitted at the lowest point with efficient drain holes, it is sometimes found that no amount of flooding will suffice for the less volatile gasolines, and that fuel must be injected either into the cylinders or into the upper portion of the induction system. On the other hand, when the induction system is of small cross section so that even when turning by hand the velocity is high enough to raise and spread the liquid fuel over the whole surface of the combustion chamber, an engine will usually start readily enough after flooding the carbureter even with a gasoline of low volatility. If the mixture from the pilot jet is sufficiently rich it will often start without any flooding at all. In some cases the induction system is so arranged that when the carbureter is flooded freely the quantity of liquid fuel taken into the induction system and cylinders is so large that the proportion of vapor to air becomes too great and the engine will fail to start from over richness. The ease, therefore, with which an engine can be started from cold can be said to depend upon the following:

(a) The arrangement and proportions of the induction system and carbureter combined with the degree of flooding which is possible.

(b) The adequacy of the pilot jet to supply a comparatively large quantity of very rich mixture, and

(c) The proportion of hexane, cyclohexane or benzene

\*From a preliminary report (slightly condensed) on research work conducted by the author for the Asiatic Petroleum Co. and published in *The Automobile Engineer*.

or other very volatile fraction in the fuel which determines the amount of flooding required.

With the least volatile of the gasolines tested it was always found possible to provide an over rich mixture on the coldest days either by doping the cylinders or, in some cases, merely by excessive flooding of the carbureter, depending on the induction system design.

Fuel	A S.G. at 15 Deg. C.	B (Boiling Point (Engler- Distillation) at				C Inlet Temp. with Std Heat g. Deg. C.	D Inlet Temp. with Std. Heat g. Deg. F. Vapor Pressure at 0 Deg. C. (32 Deg. F.) Mm. of Mercury
		140 Deg. F., 60 Deg. C., %	170 Deg. F., 80 Deg. C., %	212 Deg. F., 100 Deg. C., %	248 Deg. F., 120 Deg. C., %		
Gasoline "F"	0.704	1	27	65	86.5	20.3	68.8
Heptane ....	0.691	Bolls at 98 deg C.			(208 deg. F.)	20.5	11.5

The conclusions so far recorded apply to the composite fuels known as gasolines. The statements are not applicable to pure substances having constant boiling points. For instance, it was found almost impossible to start from cold on pure heptane even with the most careful priming of the cylinder and any degree of flooding. This test is interesting since the boiling point of heptane is practically the same as the average of that of gasoline "F," which is a very light aircraft spirit. Table XII shows a comparison of these two fuels. The inlet temperature as shown in column C of this table, gives (as will be described later) an approximate measure of the mean volatility. Column D shows the vapor pressures at 0 deg. C. of these fuels. It will be seen that while the mean boiling point and mean volatility (as indicated by induction pipe temperature) is practically the same for these two fuels, the vapor pressure under the same low temperature is very different. The fuel with the high vapor pressure started from cold with extreme readiness, while the heptane, with a vapor pressure of only 11.5 mm. of mercury column, would not start at all.

It is evident that in so far as the influence of the fuel is concerned the vapor pressure is indicative of the readiness of a fuel to start from cold. As will be shown later the mean volatility, on the other hand, largely controls the time taken to get fully under way.

There are other considerations bearing on the problem of starting from cold when fuels other than petrol and benzol are used. Two of these new factors are:

- The ratio of fuel to air required to provide an inflammable mixture, and
- The heat required to supply the latent heat of evaporation.

For any gasoline and even for a commercial benzol, both the fuel to air ratio (by weight) and also the latent heat of evaporation are approximately the same. Up till now, therefore, these variables have been neglected in regard to their effect upon ease of starting. So soon, however, as the alcohols and allied substances come under consideration as fuels these new factors must be taken into account. Table XIII shows a comparison of some typical pure substances. The first three, namely, hexane, cyclohexane, and benzene, represent the volatile portions of most gasolines.

From this table (column E, which gives the ratio between the weights of air and fuel required to provide a mixture giving just complete combustion) it is seen that for the volatile constituents of gasoline approximately 1/14 of the weight of air is required. For ether 1/11 of the weight of the air gives a correspondingly inflammable mixture, and for ethyl alcohol as much as 1/9 of the weight of the air present must consist of fuel vapor. From Column D it is seen that there is comparatively

little variation between the latent heats of the fuels named except for alcohol. The latent heat absorbed in vaporizing a pound of alcohol is no less than two and a half times as much as that required to vaporize the same weight of gasoline. Approximately 1.6 times the weight of alcohol is required to give an inflammable mixture with a given cylinder full of air, so that almost exactly four times the quantity of heat is required to furnish a combustible mixture with alcohol as compared with gasoline.

As a practical means of using alcohol the addition of comparatively small proportions of ether, with its high vapor pressure, renders starting quite easy.

So far, the problem of effecting the initial start only has been considered. As to how long a period must elapse before the engine will develop its full power depends on quite other factors than those already mentioned. The most important probably are:

- The mean volatility of the fuel.
- The arrangements provided for warming the carbureter or induction system.
- The design of the carbureter and
- The equality of distribution of the fuel to the different cylinders.

The term "volatility" here may be taken in its broadest sense, meaning the readiness with which a liquid vaporizes under any given temperature conditions. Many tests were carried out on the road with different gasolines for the purpose of investigating roughly the effect of volatility upon the time taken in getting under way with a motorcar. In each case the engine was started up from all cold and immediately driven along a level road with the carbureter set to give rather a weak mixture. The distance traveled before top gear could be taken was carefully noted, and the results were found to agree generally with the volatility tests which will be described later.

Much clearly depends upon the arrangements for heating the induction system. When the passages are water jacketed the heating up is naturally very slow because of the large heat capacity of the system; on the other hand, when the system is exhaust heated, the heat capacity is relatively small and it rapidly attains its normal working temperature.

	A S.G. at 15 Deg. C. (59 Deg. F.)	B		C Vapor Pressure at 0 Deg. C. (32 Deg. F.) Mm. Mercury	D Latent Heat B.t.u. per Lb.	E Air: Fuel Ratio by Weight
		Boiling Point, Deg. Cent.	Boiling Point, Deg. Fahr.			
Hexane .....	0.670	69	156	45.0	156	15.2
Cyclohexane .....	0.780	81	178	27.5	155	14.7
Benzol .....	0.884	80	176	26.0	172	13.2
Ethyl alcohol....	0.794	78	172	12.7	397	8.95
Ether .....	0.719	35	95	185.0	158	11.14
Heptane (pure) .	0.688	98	208	11.5	133	15.1

Carbureter designs naturally influences greatly the readiness with which power and flexibility of running are gained after starting a cold engine. If the means of compensation are effective, thereby eliminating "blind spots," i.e., conditions of throttle opening or engine speeds where the mixture becomes unduly weak, then sooner will it become possible to get the engine under full power, even when it is not yet thoroughly warmed up.

Equality of distribution is hardly less important than adequate compensation in the carbureter in its effect upon the time taken to get under way. If we assume that the carbureter delivers to the induction system a mixture of normal strength, then so long as the distribution is uniform there is still some range available on the weak side. Consequently, regular running will be ob-

Fig. 26—Curve showing variation of volumetric efficiency with change of cylinder temperature. (Compression 5:1. Other conditions constant as for Fig. 22.)

tained before the engine and induction system have reached their normal temperature. With poor distribution, whereby one or more cylinders receive a mixture weaker than the rest, the available range of mixture strength is much reduced, and consequently until everything is well warmed any attempt to open the throttle is frustrated by "popping back" due to the after-burning caused by excessive weakness of mixture in one or two cylinders.

### Mean Volatility of the Fuel

In the preceding notes on starting use has been made of the term "mean volatility." Before dealing with the subject of distribution it will be well to define exactly what is meant by mean volatility, which so far as the nature of the fuel is concerned is the most important factor controlling the time taken to obtain full engine power.

As described in a previous article on power output, a standard test was made with each fuel. The method adopted was to provide the air, as it was drawn to the carburetor, with a constant supply of heat, the heat being given by means of an electrical resistance and being measured accurately by an ammeter and voltmeter in the circuit. By driving the engine at definite speeds, by means of the electrical dynamometer, it was found possible to determine with accuracy the temperature which would, under running conditions, be recorded in the induction passage for any given supply of heat to the air if no fuel were supplied to the carburetor. When the fuel was turned on and its flow was adjusted to give a suitable standard mixture strength, the fall in temperature, caused by the latent heat of evaporation, was

noted for different fuels. Having ascertained the constants for a number of the standard fuels by means of tests made by driving the engine, it was found that the behavior as regards vaporization of the various fuels could be studied with equal accuracy when the engine was actually running under its own power.

By means of motoring tests while only air was admitted to the carburetor it was possible to determine the proportion of the heat which was lost, presumably, mainly owing to the slight blow back which occurs at inlet valve closing. This test, which was made at various engine speeds, consisted in rotating the engine while cold (and without fuel) at a constant speed, and supplying the air intake heater with a known quantity of heat, the difference between the temperature of the air in the induction pipe and that of the outside air being noted.

Since both the specific heat and the weight of air passing was known within fairly close limits, the actual quantity of heat taken into the engine could be calculated. In this determination the only assumption made was in regard to rate of flow of air. Subsequent tests, some of which are described below, made with a displacement air meter, showed that the estimated flow, taken from calculated volumetric efficiency, agreed with the measured flow within such close limits as to affect the results of the heater tests to only a negligible degree.

Having determined the corrections required for measuring the actual heat supply under any conditions of engine speed, tests to measure the effective volatility of the fuel under running conditions could be made.

The standard test made on each of the fuels referred to in these articles included the following readings:

\*Approximate

(a) Temperature recorded by thermometer in the induction pipe close to the inlet valve housing.

(b) Temperature of the outside air before entering the heater.

(c) The net heat input to the carbureter.

(d) Fuel consumption.

For the standard test the net heat input was maintained constant at 0.0433 B.t.u. per revolution of the engine. The fuel consumption was adjusted as nearly as possible to that giving a mixture strength 20 per cent greater than that required for complete combustion, this being the mixture strength at which maximum power is obtained with fuels such as gasoline and benzol. The temperature rise or fall, i.e., the difference between reading (a) and reading (b), is given in Table XIV for most of the fuels tested. (See Column B.)

In this table is shown (Column C) the boiling point or boiling range of each of the fuels named. In Column D the latent heat per lb. is given, and in Column E the air-fuel ratio for just complete combustion is shown. Finally, in Column F the vapor pressure at 0 deg. C. (32 deg. Fahr.) is indicated.

An examination of the table shows that the temperature rise above atmospheric temperature (or the fall below that temperature in the case of the very low boiling point fuels) varies consistently with the boiling point or with the average boiling point as given by the Engler distillation curve. It may be seen, also, that the temperature rise bears no relation whatever to the vapor pressure. For example, in Fig. 21 the distillation curves of gasoline "E" and "F" have been drawn from the values shown in Table XIV. While, as will be seen from the table, these two fuels have almost exactly the same vapor pressure, the average boiling points as shown by

the curves are approximately 104 deg. C. and 92 deg. C. (219 deg. Fahr. and 197 deg. Fahr.) respectively. The temperature as measured in the induction pipe clearly indicates the difference in the mean volatility. For gasoline "E" the temperature rise was 10.5 deg. C. (18.9 deg. Fahr.), while for gasoline "F" it was only 5.5 deg. C. (9.9 deg. Fahr.).

Since the lower temperature must be caused by more rapid evaporation within the induction system these temperatures may fairly be taken as a good indication, relatively, of the effective or mean volatility of the fuel.

Temperature readings are given in Table XIV for alcohol and other substances having high latent heats. In these cases, it must not be assumed that the measured temperature is always a true indication of the rate of evaporation taking place within the induction pipe, since where there exist considerable differences in latent heat an exact comparison becomes altogether too complicated.

### Distribution

To obtain equality of mixture strength or good distribution to a number of cylinders fed by one carbureter is one of the most difficult and complex problems which confront the designer of an internal combustion engine. No attempt will be made to deal with all the mechanical considerations which have to be taken into account, since anything approaching a complete treatise on this subject would be far too lengthy to include here; moreover a complete knowledge is by no means available. In passing, however, it may be remarked that for three, four, six and eight cylinder engines complete mechanical symmetry is impossible if only one carbureter is used.

At a time when so much still remains to be learned as to conditions governing distribution in a multi-cylinder engine it would be unwise to attempt to draw too many conclusions as to the influence of the nature of the fuel upon distribution. This much, however, seems to be fairly clear, namely, that the uniformity of distribution, that is, the uniformity of mixture strength supplied to each individual cylinder of any group drawing from one source of supply, depends primarily upon the design of the induction system generally and to a surprisingly small extent upon the nature of the fuel. A really well designed and efficient distribution system appears to maintain nearly the same uniformity of mixture strength on all fuels, while a badly designed system will give poor results on all fuels, though its defects are more accentuated the lower the volatility of the fuel.

It is concluded from observations on various multi-cylinder engines that the question of distribution and its relation to the fuel must be considered from two independent standpoints:

(1) The uniformity of the mixture strength supplied to each individual cylinder from any one source of supply.

(2) The uniformity of the mixture strength delivered to the induction system as a whole.

With regard to the first of these points, it may safely be accepted from the outset that the mixture entering the cylinder under almost all conditions of running consists of a non-homogeneous mixture of air, fuel vapor and liquid fuel. Only when running throttled, and then probably only after the induction system has been warmed by previous running, can it be assumed that the charge reaches the inlet valves as a mixture of vapors only.

It is clear that since both the liquid fuel and the air are traveling at approximately the same velocity the inertia of the former is greater, and that to avoid inequality of supply as between different cylinders it is most important that the induction system shall be as symmetrical as possible. Provided that not more than three cylinders are drawing from any one source of supply it is not difficult to design a reasonably symmetrical and uniform induction system, but so soon as the number drawing from one carbureter exceeds three the difficulty is greatly increased; for not only is the sequence of the induction strokes disturbed, but the effective induction periods themselves overlap.

From the above considerations it will be apparent that the uniformity of distribution as between individual cylinders is mainly a problem of induction pipe design, and only in a secondary degree is it affected by the nature of the fuel. The extent to which the nature of the fuel influences equality of distribution is most difficult to investigate accurately. No suitable apparatus as yet exists on which the behavior of fuels in this respect can be fully explored.

The next point to be considered is the influence of the nature of the fuel upon the uniformity of the mixture delivered to the induction system as a whole. To appreciate this problem we must try to visualize the changes that occur in the induction system when the load is varied. What occurs in any manifold appears to be substantially as follows:

When the engine is throttled and is running light the absolute pressure in the induction system may be as low as 5 lb. per sq. in., or about 10 lb. per sq. in. below atmospheric pressure. The effect upon the liquid fuel is exactly as if its mean volatility had been suddenly increased. Its latent heat is practically unaltered, but it will tend to evaporate at a much lower temperature.

The latent heat required to produce evaporation is obtained partly by lowering the temperature of the small quantity of air that is drawn in under throttled conditions, but also, and probably chiefly, by conduction through the carbureter and induction pipe. If now the throttle is opened, the pressure within the induction system rises immediately, and a large proportion of the entering fuel is precipitated on the previously dry walls. Such precipitation then continues until the walls are thoroughly wetted, the thickness of the layer of liquid depending upon the design of the system generally, also upon the temperature of the walls and the velocity of the gases. For any given design of system the lower the velocity, and therefore, also, the lower the engine speed, the greater the thickness of the layer so formed. Now unless the carbureter supplies a very rich mixture at this stage the cylinders will receive only a weak mixture until the requisite layer has been formed, with the result that the engine will either stop altogether, or will fire back into the carbureter due to the slow burning. If now the carbureter be so adjusted as to supply under these conditions a mixture sufficiently rich in fuel, not only to meet the condition of supplying liquid to line the walls, but, at the same time, to supply over and above this demand sufficient fuel to form a combustible mixture in the cylinders, it follows that so soon as the layer has been formed the mixture supplied thereafter will be excessively rich. In order to obviate the difficulty, many designers endeavor to raise the temperature of the induction system so as to evaporate at once any fuel which may precipitate thereon.

In order to accomplish this result with most fuels of low mean volatility, it will be necessary to maintain the temperature of the walls unnecessarily high for ordinary running. This clearly will have the effect of decreasing the available power and of increasing the tendency to detonation at a moment when detonation is most liable to occur.

It would appear to be far more preferable to accept the necessity for the formation and existence of a layer of liquid in the induction system and to cater for its immediate formation by so designing the carbureter that it will, immediately the throttle is opened, supply a good gulp of liquid fuel, and thereafter continue to supply mixture of normal strength. In such carbureters as the Zenith or the Claudel, means are provided for supplying a sudden gulp of liquid, which has collected in the diffuser or compensating jet chamber, but although these carbureters are designed to do this, the quantity stored up and delivered suddenly is generally quite insufficient to meet the needs of a cool induction system and a fuel of low volatility. If the capacity of the storage well or diffuser tube could be made adjustable it would probably be found possible to obtain instant acceleration with almost any gasoline and without the necessity for adding more heat than is needed to prevent freezing in cold weather. This conclusion is made on the assumption that the system is such that equal distribution of mixture between the cylinders is derived without the addition of heat. At present, it is seldom that a design is met with in which it is not necessary to add considerable heat to the system in order to mitigate the consequences of what are in fact defects in design. It would appear that the efficiency of an induction system may be gaged by the amount of heat required.

The actual experiments carried out with different fuels all tended to confirm the conclusions arrived at. Tests were made on a number of different multiple cylinder engines with good, bad and indifferent induction systems. It was confirmed that those engines with bad

distribution systems gave poor results on all fuels, though their performance was improved by the use of the more volatile fuels. On the other hand, engines having efficient induction systems were affected by changes of fuel volatility to a very small degree.

As explained in the first article, most of the multi-cylinder engines employed for this research proved so inefficient and so sensitive to large variations in friction, etc., that truly comparative results were seldom obtainable, while the more efficient research engines having each only one cylinder naturally could not be utilized on the problems of distribution.

While many experiments have been made and a great deal of data collected as to the variations in power, output and efficiency with various fuels when used in multiple cylinder engines, the writer feels that none of it is sufficiently reliable to justify publication. To obtain reliable information on this subject it would appear to be necessary to design and build a special engine equipped with several different types of induction system and all the features necessary to insure consistency of running, which is the first essential condition of any reliable scientific test. Whether, in reference to motor fuels, the information obtained would be of sufficient value to warrant the heavy expense of such an undertaking, is, in the writer's opinion, open to question. Such information, however, would be of very great value to the designer and manufacturer of engines, for it seems clear that the problems relating to distribution are problems of design in the first place, and that the nature of the fuel plays but a secondary part. As a piece of engine research it is, in the writer's opinion, by far the most urgent and important of any which could be undertaken at the present day. It is the one factor about which least at present is known, while it exerts a more powerful influence upon the performance of an engine than almost any other.

### Volumetric Efficiency

Volumetric efficiency is defined as the ratio of the weight of air drawn into the cylinder per cycle to the weight of air at 0 deg. C. (32 deg. Fahr.), and 29.92 in. of mercury pressure which would just fill the volume swept by the piston in one stroke.

During the latter period of the fuel research means have been available for measuring accurately the weight of air taken into the engine. Attempts to work with calibrated orifices proved very disappointing. They yielded somewhat erratic and wholly unconvincing results, also the very serious difficulty of calibrating the orifices, and their "sensitiveness" to the sharpness of the edge rendered this method of measurement unreliable. In order to obtain a correct value for the mixture strength used, and a correct determination of the efficiency with which the fuel was burned, it was essential to provide means for measuring the weight of air taken into the engine not only in relative but also in absolute terms.

After much consideration it was decided to construct a gas holder having sufficient capacity to supply all the air required to consume the measured quantity of fuel at the weakest possible mixture strength. The details of this arrangement will be dealt with later.

For the present it is sufficient to state that means are now provided whereby both the number of cubic feet of air and the number of revolutions of the engine during the consumption of a measured quantity of fuel, are recorded automatically and simultaneously, the former to within  $\pm$  one-fifth of a cu. ft. and the latter to within  $\pm$  4 revolutions. The air from the gas-holder passes on its way to the carbureter through an expansion chamber

of 8 cu. ft. capacity, which is interposed in order to damp out oscillations in the pipe. The temperature as it passes through this capacity is measured by means of a thermometer. In all cases, the measurements recorded here of air consumption and of volumetric efficiency are reduced to terms of standard temperature and pressure, 0 deg. C. (32 deg. Fahr.) and 29.92 in. of mercury.

So far the apparatus has been in operation for a short time only, but the following tests have been carried out. The tests on volumetric efficiency referred to below were carried out with a different combustion head from that used throughout all the preceding tests. With this combustion head both the mean effective pressure and the thermal efficiency of the engine are substantially higher than with the head used previously. It will be observed, for instance, that in Figs. 23, 24 and 25 the mean effective pressure under any given set of conditions is much higher than that recorded hitherto; this difference, however, does not affect in any way the deductions to be drawn from the volumetric efficiency tests, and the writer mentions it only to explain what might otherwise appear to be a glaring discrepancy. The tests which have been made are as follows:

(1) Tests of volumetric efficiency at constant mixture strength with constant heating and at varying compression ratios on gasoline "A" and on benzol.

(2) Tests of volumetric efficiency over the whole available range of mixture strength with compression ratios of 4:1 and 6:1.

(3) Tests of volumetric efficiency with gasoline "A" and with 95 vol. per cent alcohol at a constant compression ratio and constant heating.

(4) Tests of volumetric efficiency with constant mixture strength and varying heat input to the carbureter.

(5) Tests of volumetric efficiency with hot and cold cylinder walls at a constant compression ratio and with other conditions constant.

In a previous article dealing with power output the writer referred to the apparent variation in volumetric efficiency at different compression ratios, and pointed out that it was not at all easy to explain why this should occur. That it was the volumetric efficiency alone that varied was evident from the following considerations:

(a) With increase of compression the thermal inefficiency rose at a rate in excess of the rise in mean pressure.

(b) No mechanical or external temperature conditions were in any way affected by the change in compression ratio.

The only possible inference to be drawn from these phenomena was that for some reason the volumetric efficiency became less as the compression ratio was raised. The data obtained from recent tests with the air measuring device referred to above confirm this. From Fig. 22 it will be observed that direct air measurements under identical conditions show a steady fall in air consumption as the compression ratio is raised. Every care was taken to insure that neither the mixture strength, the temperature of the cylinder jackets, nor the rate of heat input to the carbureter were varied.

The curve shown in Fig. 23 illustrates the observed variation in volumetric efficiency over a wide range of mixture strength for gasoline "A." As might be anticipated, the variation is small. It is seen that the volumetric efficiency is at a minimum when the mixture strength is that giving just complete combustion, and that it rises slightly as the mixture is either enriched or weakened from the normal; the former because of the increased proportion of liquid fuel entering the cylinder and the consequent fall in suction temperature due to the latent heat of evaporation and the latter, presumably, because of the lower

(Continued on page 477)

# A New Design of High Speed Engine Indicator

German instrument employs steel pencil to trace extremely small diagram on soot-covered glass plate. Diagram is then enlarged by use of microscope. Indicator is self-contained and carried directly on engine cylinder.

By Benno R. Dierfeld

THE disadvantages of the optical indicator or manograph as a factory testing instrument are well known, and considerable work has been done in recent years, especially in connection with the experimental development of aircraft engines, with a view to producing an indicator that should be either more reliable and more handy to use. Dr. Ing. Mader, chief engineer of the testing laboratory of Prof. Junkers, has developed a new type of indicator for high speed engines which is claimed to be free of the various defects of the ordinary optical indicator. It is based on the same principle as the ordinary steam engine indicator. In the steam engine indicator the stroke of the piston is  $3/8$  to  $5/8$  in., and a magnifying linkage must be used for tracing the diagram on an oscillating drum driven from the engine. The difficulty of constructing an accurate, strongly magnifying linkage led Dr. Mader to divide the process of taking indicator cards into the following two phases:

1—The direct tracing of the piston movement with extremely small strokes, with the idea of reducing all movements and all moving masses to a minimum, so as to diminish inertia effects at high speeds of revolution.

2—The enlargement of this indicator card later on in a special enlarging machine.

This new principle makes it possible to trace the piston movement with sufficient exactness by a linkage which is kinematically quite simple, and by a transverse movement of the light writing pencil itself, instead of by the movement of a large drum. The results obtained with an instrument based on this principle and the dimensions chosen for the Micro-indicator in the first place depend upon the fineness of the lines which can be traced. For this reason the steel pencil must be provided with an exceedingly fine point, which must pass over a very smooth scribing surface and leave a permanent line. It has been found that the best surface is furnished by glass with a

Fig. 13—Diagram taken on single cylinder engine at 960 r.p.m., showing 294 lbs. explosion pressure. Fig. 14—Diagram from same engine at 2,000 r.p.m. with dulled pencil. Fig. 15—Diagram taken after indicator piston had been reground and lubricated with heavier oil

thin covering of soot. This also has the advantage that it permits of considerable enlargement of the record in the transmitted light of the microscope.

Sooting of the plate may be effected by means of an ordinary candle. If the sooted records are to be kept, they may be fixed by pouring (not spraying) a colorless drying lacquer over the glass. By wiping such fixed plates off with alcohol, the glass is immediately available for making new records. The fineness of line obtainable in these records is about  $1/50$  mm. (slightly less than 0.001 in.) and the dimensions of the whole record are 2 mm. ( $5/64$  in.) in both directions. As the pencil is applied to the surface of the glass plate with some pressure, its point becomes dulled, which results in the tracing of wider lines; for ordinary tests this is of little consequence, but if the highest degree of accuracy is desired the pencil must be changed. Both the pencil and the pencil holder are standardized.

The principal parts of the Micro-indicator (Fig. 1) are the same as those of the steam engine indicator, but there is a difference in that the piston and rod assembly is guided only at two points, by the piston below and by the spring above, the latter being a double helical spring. This method of guiding does not seem to provide against oblique motion of the piston rod, but slight obliquity has been proven by tests to be of no consequence, as regards accuracy of the diagram, and great obliquity is impossible. With this construction sticking of the piston is evidently impossible. The piston, hollow piston rod and spring are assembled into a single unit and are removed together if it is desired to use a spring of different scale. This avoids the need for all dismantling of the individual parts in service and obviates chances of incorrect assembly.

The piston, which is ground on its cylindrical surface, is made rather short, so as to allow of slightly oblique positions of the rod. The bore is such as to give a piston head area of exactly one square centimeter for pressure up to 30 atmospheres. For higher pressures, up to 100 atmospheres, instead of the spring being made stronger, the piston diameter is decreased. Within the cylinder body of the indicator there is provided a cock. This cock would be required in any case, and, rather than making it a separate piece, it is placed right in the cylinder body so as to shorten the connection to the cylinder, slightly throttling the gas entrance to the piston and minimizing the change in volume of the compression chamber by the connection of the indicator. The gas space below the indicator piston, inclusive of that of the cock plug and connection, is only about  $1/4$  cu. in., so the instrument can be connected to the smallest automotive cylinders such as those of motor cycle engines.

The movement of the indicator pencil, which traces both the variation of the gas pressure and the piston motion, is imparted to the pencil by the simple linkage illustrated diagrammatically in Fig. 2. The piston rod

is provided with a mushroom head a, upon which rests the rounded end of the rod b. The point of the indicator pencil passes exactly through the center of the rounded end S of this rod. The other end E of the rod is moved to and fro by a small lever c oscillating around D. A coiled spring f with numerous convolutions prevents backlash in the joints and insures good contact of the end of rod b upon the head of the piston rod. The tension of spring f, which increases very slightly as the spring extends, has only an infinitesimal influence upon the scale of the main spring of the indicator. This tension must be at least equal to the maximum force of acceleration on the rod b, so as to prevent the end of the rod from breaking contact with the piston rod. The head of the piston rod and the end of the rod b are hardened, and these parts must be carefully lubricated to prevent wear. The simple linkage a, b, c makes possible, by lifting the piston rod a, the tracing of the pressure coordinate, and by turning rod c, the tracing of the piston stroke in a system of rectangular coordinates. The tracing of the piston stroke is not absolutely accurate, as the mechanism is not a reduction of the crank and connecting rod mechanism of the engine, but the maximum possible error is said to be only 1.3 per cent.

In the design of the pencil carrying lever the following requirements must be met: The pencil must be gently pressed against the plate on which the diagram is to be traced. The axis of the pencil and the axes D and E must be maintained accurately parallel. The pencil must be removable with a single motion of the hand, and, finally, there must be no transverse rotation of the pencil in the direction of the piston axis in the case of high accelerations. The design Fig. 3 is said to meet all these requirements. It has no screw connection and the blade springs are integral with the hub of the pencil lever. The yieldably mounted pencil holder is riveted to the spring blades. The pencil is inserted or removed by grasping the disk pressed over its end, which projects above the holder. A shoulder on the holder bears against the strong lever and the spring blades cannot be bent or twisted.

A photograph of the complete Micro-indicator is reproduced in Fig. 4 and Figs. 5, 6 and 7 are assembly views. It comprises the glass plate holder A, a U-shaped frame which, together with the spring and back shield, holds the sooted glass plate, which is inserted from above. The plate holder is rotatable around an axis and is pressed against a cam by a spring. By one turn of this cam with a small hand crank the glass plate can be pressed against the indicator pencil or withdrawn. If a second record is to be taken the glass plate is shifted slightly forward by means of a ratchet. In this way as many as 24 records can be traced on a single plate (in two rows).

For the drive of the Micro-indicator the ordinary spring pulley mechanism was out of the question. A simple linkage with as few joints as possible, no backlash and

Fig. 4—Photographic view of complete Micro-Indicator. Fig. 8—Micro-Indicator applied to single cylinder vertical engine. Fig. 9—Camera used with Micro-Indicator. Fig. 11—Microscope with Leitz drafting ocular applied.

no danger of bending was required. A suitable device is the oscillating drive shown in Fig. 7, which, however, does not make correction for the finite length of the connecting rod, and, therefore, calls for a correction of the diagram for accurate research work. For ordinary factory tests, such as ignition and valve timing check tests, determination of the compression and explosion pressures, the small error in the record is of no consequence. This kinematic error of the oscillating drive could be reduced in a simple manner by shortening or lengthening the central rod. The drive consists of a divided eccentric disk with an eccentricity of 12 to 15 mm. ( $\frac{1}{2}$  to  $\frac{5}{8}$  in.), the connecting rod (whose length varies with the height of the engine), and the upper oscillating lever which is 45 mm. (1.77 in.) long the shaft of which drives the indicator. The bearing of the oscillating lever must be rigidly supported on the engine, so that it participates in all vibrations of the engine.

The pencil can be changed only while the pencil holder is at rest, and for that reason a disengaging clutch must be provided in the linkage which must have absolutely no backlash. This function is performed by means of a simple clutch with spring-supported pins. The drive must be very carefully synchronized, otherwise the diagram will be faulty.

If the dead center position cannot be determined very accurately, the middle of the piston stroke is taken as a reference point, for which the indicator pencil must stand in exactly the same position for both the up and the down stroke. This synchronizing adjustment is made by turning the eccentric disk. However, it is necessary that the fork of the indicator oscillate equal distances to both sides of the central position, which are marked by lines to avoid faults in the drive.

The Micro-indicator is usually fitted into the hole of the priming cock, spark plug or valve cap. In the case of small air-cooled engines a hole may be drilled directly into the cylinder wall, but in that case the indicator must be supported otherwise. In every case the admission passage of the indicator should be made as short as possible, and in this respect the Micro-indicator is quite an improvement over the usual optical indicator.

For the second phase of the indicating operation a well known and highly developed instrument can be used—the microscope with its auxiliary apparatus. For purposes of valve or ignition timing the record can be inspected with the microscope, for which purpose the sooted glass plate is placed on the table of the microscope like a microscopic slide and is illuminated from below by a

mirror. A magnification of thirty-two to eighty times is usually sufficient. With such magnifications a slight distortion of the rectangular coordinates can be perceived, but only at the margin of the plate.

Measurement of the diagram can be effected either directly by means of an ocular-micrometer, or, after enlargement by micro-photograph or by planimetric means. For scientific purposes and purposes of reproduction the micro-photographic method is to be recommended as the most reliable, because the difficulty of providing an intense source of light and because unequal periods of exposure are done away with. A simple photographic camera without bellows (Fig. 9) serves this purpose. The microscope is arranged horizontally on a sliding base; the end of the tube with the ocular projects into a solid box, into the rear end of which are slid the opaque ground glass or the plate holder. Focussing is effected by means of the microscope.

This procedure, however, involves the inconveniences of all photographic processes. This may be obviated by means of a drafting device used as an auxiliary to the microscope. Well adapted for this purpose is the drafting ocular of Leitz (Figs. 10 and 11). It is inserted in the tube of the microscope like an ordinary ocular. Then the rays reflected by the mirror, which trace the image of the microscopic slide, pass in the usual way through object holder, object and ocular to the eye of the observer without change in direction. Simultaneously on the same perspective plane there appears a drafting plane by double reflection, so that the diagram may be traced accurately by hand with a pencil. The rays from the drafting plane pass through the upper and lower face of the prism almost at right angles and are totally reflected by the side faces of the prism. Generally the image of the microscopic slide will not appear with the same intensity as the drafting plane, therefore the latter image must be softened by smoked glasses of different degrees of transparency. The drafting plane appears at the standard visual distance.

Instead of copying the image and later on measuring it up with a planimeter, the diagram may be measured up directly under the drafting ocular with the compass. In order to obtain equally spaced ordinates, suitable ink lines are traced on the drafting plane. In order to correctly interpret the diagram it is absolutely necessary to accurately determine the scale, that is, the magnification and the calibration of the spring. The magnification is most readily determined by means of a finely divided scale, as, for instance, 2 mm. divided into 200 parts. This glass scale is put in the place of the record, is magnified the same number of times and therefore measures directly.

For calibrating the indicator spring a device of the type illustrated diagrammatically in Fig. 12 is used. The lever arms bear to each other a ratio of 1 to 10, and comparatively small weights can therefore be worked with. By means of an adjusting device the beam of the scale can always be brought back to its horizontal position. The Micro-indicator is screwed to the top of the calibrating device and is accessible from all sides.

A few diagrams taken from the old single cylinder engine of Fig. 8 are reproduced herewith. These, of course, are considerably enlarged from the 2 x 2 mm. micro records. Fig. 13 shows a card taken at 960 r.p.m. The maximum explosion pressure is 294 lbs. p. sq. in., the compression being faulty. At higher speeds the oscillations of the indicator become stronger, but the defect may be easily corrected. Fig. 14 shows a card taken at 2000 r.p.m., the heavy line being in part due to a dulled pencil point but chiefly to the fact that a large number of diagrams were traced one over the other. After the indicator piston had been reground and supplied with heavier lubricating oil the diagram Fig. 15 was obtained.

# Casting an Aluminum Head on a Steel Cylinder

Experiments being conducted in efforts to solve this problem at McCook Field indicate that a good bond can be secured by first sherardizing the steel barrel. Phosphor bronze employed for valve seats.

By E. H. Dix, Jr.\*

THE metallurgical aspects of the problem of casting an aluminum head on a steel cylinder for an air cooled aviation engine are interesting. A good idea of one design is obtained from the accompanying cut (Fig. 1), of a casting made in the McCook Field foundry. The first problem considered was whether or not an alloy bond could be formed between the steel cylinder and the cast aluminum head. This was attached by making up dummy rings to represent the portion of the cylinder on which the head was to be cast. Six different rings were experimented with: 1—uncoated, 2—sherardized, 3—zinc electro-plated, 4—copper plated, 5—calorized, 6—tinned. It was found that a satisfactory bond was formed with either the sherardized coating or the tinned coating. Sherardizing was decided upon because of the higher melting point of zinc. Fig. 2 is a composite photo-micrograph showing the nature of the bond formed with the sherardized coating. The lettering explains the four different zones.

The next problem was the choice of an alloy for valve seat inserts and spark plug bushings to be cast into the head. A number of alloys were tested and it was found possible to obtain a satisfactory cast-in seat using rolled phosphor bronze of  $3\frac{1}{2}$  per cent tin, Monel metal or cast iron, but the rolled phosphor bronze was chosen because its coefficient of expansion is closer to that of aluminum.

The next step after these preliminary experiments was to make the actual casting. Fig. 3 shows the open mold with steel cylinder, cores, valve seat inserts and spark plug bushings in place. The job was made up using dry sand cores inside and outside. The method of gating is evident from the view of the cope. Three overflow risers were placed to allow for the pouring of metal through the mold.

Metal was poured through the mold so as to heat the cylinder and prevent the cracking of the aluminum casting if possible. However, the first casting showed a serious axial crack just over the steel ring. It was therefore decided to put a heating coil inside of the cylinder. This

was done and a second casting poured. In this case, however, the cores were thoroughly heated before pouring, and the whole mold was placed in a core oven at 500 deg. Fahr. immediately after pouring and allowed to anneal for a day and a half. This eliminated the cracking around the steel cylinder but a crack developed between two of the valve seat inserts. It is believed that these difficulties can be overcome by slight changes in the method outlined although preheating the mold and the subsequent annealing would make a rather expensive production job.

It was therefore decided to endeavor to find an alloy which is less liable to crack than the one previously used which was 7 per cent copper, 1 per cent tin, balance aluminum, this being recommended from the experience gained in England on similar work. To guide us in this selection a hot shortness test was devised. This consisted in casting a test bar around steel lugs fixed 12 in. apart. The first three bars were 8 per cent copper, 10 per cent copper, 7 per cent copper and 1 per cent tin, respectively and they all cracked. The fourth bar was a silicon aluminum

alloy on which the Material Section is experimenting at this time. This bar, not only showed no crack when cast in this manner but afterwards showed a tensile strength of about 21,000 lb. per sq. in. with  $1\frac{1}{2}$  per cent elongation. This is the normal strength for this alloy but the elongation is slightly low. This alloy has further been investigated for strength at high temperatures and it has been found that the tensile strength at 300 deg. Fahr. is only  $2\frac{1}{2}$  per cent less than at normal temperature and at 500 deg. Fahr. 20 per cent less than normal. Previous tests have shown that the tensile strength of 12 per cent copper alloy falls off about 24 per cent at 300 deg. Fahr. and 30 per cent at 500 deg. Fahr. It is thus concluded that the silicon alloy is satisfactory for the cylinder working temperature. Porosity tests have shown that it is possible to cast a cup  $\frac{1}{8}$  in. thick and remove the skin from both the inside and outside and yet have it hold 120 lb. air pressure without any leak. Arrangements are being made at the Bureau of Standards to have coefficient of expansion tests made on this alloy. The problem is now of very vital importance to the Air Service.

## New Electric Self-Loading Truck

**T**HERE are two outstanding features in the electric industrial truck illustrated herewith, which is a product of the Cowan Truck Co. One is the anti-kick device, which takes the jar off the steering handle, and another the vertical lift mechanism, which is of different design from that used in the previous type of Cowan electric self-loading truck. This lifting mechanism is of the bell crank type and is actuated by an independent G.E. series wound motor with worm gear drive. The platform elevates vertically with a maximum rise of  $4\frac{1}{2}$  in. obtained in 5 seconds while carrying 5,000 lbs. load. The lowering time is only 3 seconds. The platform may be stopped at any point going up or down, and the motion reversed. A brake on the motor shaft prevents coasting or accidental dropping of the load. An automatic trip stops the load platform when fully elevated or lowered. The lifting mechanism is controlled by a switch at the driving end of the truck. The lifting mechanism is installed under the load platform where it is well protected yet accessible, it requiring only the removal of two pins to tip up the load platform and thus expose the whole mechanism.

Flexibility in operation is secured by the provision of three forward speeds and three reverse. Steering is by all four wheels and this enables the truck to turn in a radius of 7 ft.  $5\frac{1}{2}$  in. This means that the truck can be operated in intersecting aisles 57 in. wide. To start the truck, the operator steps on the pedal, which releases the

brake and closes the battery circuit. The circuit breaker will close only when the controller is in the neutral position. This compels the operator to always start in the first speed and increase the speed gradually. Whenever the pressure on the pedal is removed the circuit is broken and the brakes are applied automatically. To prevent meddling, the controller handle is arranged detachably.

The power equipment comprises either a 12-cell Exide battery of 238 ampere-hours capacity or a 21 cell Edison A-6 battery. Either battery provides power for 12 hours continuous operation, it is claimed. The driving motor is of G.-E. make, series wound, of the railway type.

## A German Automobile Engineering Handbook

**A**N engineering handbook printed in German, somewhat similar to Kent and other standard American engineering handbooks but covering automobile engineering only, has been published for a good many years by M. Krayn of Berlin, and this work has just appeared in its tenth edition. It should be pointed out, however, that while the book is similar to the American handbooks in form, method of treatment and voluminousness, it is not their equal in the quality of typography, which is, of course, readily explained in view of the much narrower field to which it appeals.

The present, tenth edition, which has been brought out under the direction of Richard Bussien, is completely revised and contains a great deal of new matter. In former editions the first part of the book contained general mathematical and mechanical material, but this has been wisely omitted in the new edition, because it can be found in better form in any of the well-known mechanical engineering handbooks. The chapter on Motorcycles has been entirely rewritten, and there is also in the new edition a very informative chapter on Motor Fuels. The work is not confined to automobiles but also covers motor boats, motor cycles and farm tractors. Every part of an automobile is thoroughly covered by text and illustrations, and many formulæ and much tabular material are given. The work is of pocket book form, and contains close to 1200 pages text and nearly 1000 illustrations.

Cowan industrial truck

# Adapters Designed to Increase the Output of Various Machine Tools

Devices here described are intended to reduce attention required by operator and enable machine to turn out more parts per hour. They are applicable to several types of manually controlled machine tools.

**A**DAPTERS (or conversion units) designed to give a machine of older model or simple type some of the advantages of a more up to date model or a more elaborate type, are quite familiar in the automotive industry. Lately the plan of providing adapters seems to have come into vogue in the machine tool industry. Of course, special attachments for machine tools, permitting of doing certain kinds of work on the tool for which it was not designed originally, have been offered for a long time, but we are here concerned with a different type of attachment, which is not intended to change the range of adaptability of the tool, but rather to increase its output, reduce the attention required and permit one operator to look after two or more machines. These are features incorporated to a remarkable degree in the newer designs of production tools, the appearance of which upon the market has often made it expedient to scrap tools of earlier design still in a serviceable condition. Two examples of such attachments are illustrated herewith.

An oil pressure feed control system for machine tools has been developed by the Oilgear Co. It has been applied to lathes, boring mills, hydraulic presses, etc. The advantages of such a feed control are that it reduces operators' fatigue and permits of an increase in output.

The feed control system consists essentially of a pump with variable delivery, and a motor driven by the working fluid, that is, oil received from the pump. The pump is ordinarily driven from the countershaft of the machine tool, and the motor attached to the carriage or ram on which the feed is desired.

Two types of feeding motors are employed; the direct

acting pushing cylinder, and the rotary motor, the former being used when space conditions permit. In equipping old lathes the pushing cylinder is ordinarily mounted at the rear of the lathe bed behind the head stock, the piston rod extending toward the tailstock and being bracketed to the rear part of the carriage. The rotary type of motor is shown at B in Fig. 1 geared to the lead screw of a lathe. This form of installation is necessary for very long machines, and frequently for cross feeds, where it is necessary to have a screw control of the tool slide.

It is claimed that this type of feed gear has many advantages for heavy machine tools. Prominent among these is the rapid traverse movement, which is obtained without any additional mechanism. This enables the operator to move heavy carriages and rams quickly and without the usual fatigue. The hydraulic feed permits the operator to readily increase the feed when cuts become lighter, back out the tool for examining the cutting edge, and return it quickly into the cut without any disconnection of friction clutches, etc. Another important advantage on production jobs is the ability to use two or three different feeds in quick succession, when the cuts only last a short time. In such cases geared feed boxes cannot be operated quick enough to be available.

Fluid from the feed controller is delivered at a rate and in the direction required for the function desired by the operator. The pressure in the system varies with the resistance offered to the cutting tool. If this pressure rises above the maximum required for feeding, a relief valve opens and permits the feed motor to come to a stand-

At Left (Fig. 1)—Lathe fitted with Oilgear feed control. A, feed controller; B, rotary motor driving lead screw; R, control shaft. Above—Variable speed drive applied to 7 foot boring mill. A, Oilgear drive; B, control handle

still. This function is made use of in locating shoulders, etc., in work to be machined; as it is only necessary to set rigid stops and let the carriage run against them.

#### Variable Speed Spindle Drive

The Oilgear Co. has also developed a larger type of machine designed to drive the spindles of machine tools at any desired speed, from a line shaft, a constant speed electric motor, or a gasoline engine. The unit is designed for driving lathes, boring and milling machines, etc. The principle of operation is similar to that of the feed control system, affording an infinite number of speed changes in either direction through the manipulation of a single control handle. The speed is independent of changes in load, unless the load becomes excessive in which case an automatic overload gear comes into action. The overload gear may be adjusted to any desired maximum load. When this is exceeded, the speed will be reduced, even to stopping the tool entirely in case of a jam.

#### The "Iron Man."

An attachment for hand screw machines known as the Iron Man, which imparts to them the qualities of the automatic screw machine, notably the feature of automaticity permitting one operator to run a number of machines, has been developed by the Pearson-Scott Co.

The Iron Man—an attachment for hand screw machine.

The attachment weighs less than 1,000 lbs., occupies a space 2 by 4 ft. and can be applied to the machine in 5 min., it is claimed. The only change which needs to be made on the screw machine is the removal of the hand wheel on the cross slide. The turret locking and unlocking device and the stock feed control are features which can be used with any machine, but they are essential when the attachment is to be used. The bracket supporting the cross slide feed must be attached to the machine. It is claimed that the machine can be set for even a difficult job in about 2 hours' time. The attachment can be applied either to the head end or the turret end of the screw machine.

## Influence of Various Fuels on Engine Performance

(Continued from page 470)

surface temperature of the head, cylinder walls and piston resulting from the lower flame temperature at very weak mixtures. Fig. 24 shows the variation in I.M.E.P. and in volumetric efficiency with varying mixture strength for gasoline "A" and for ethyl alcohol 95 vol. per cent. It is seen that the increase in maximum power (as shown by the I.M.E.P.), comparing gasoline and alcohol, is more than the increase of volumetric efficiency between these two fuels. This is probably to be explained by a fact, which has been established by previous tests, that the thermal efficiency with alcohol is slightly higher than with gasoline. The rise in volumetric efficiency at rich mixtures is clearly shown in this figure, particularly in the case of the curve for alcohol, indicating, as was suggested in the last paragraph, that the rise in volumetric efficiency and power is mainly due to the extra cooling of the charge by evaporation.

In Fig. 25 is shown the variation of volumetric efficiency and maximum I.M.E.P. when the heat input to the carbureter is varied. The relation between volumetric efficiency and heat input was found to be substantially the same for any of the fuels tested with the exception of the alcohols. The variations in temperature as recorded in the induction pipe due to differences in volatility of fuel appeared to have no influence on volumetric efficiency. The exception provided by the tests on ethyl alcohol confirms the conclusion arrived at previously by tests on power output, namely, that the whole of the liquid, with a fuel of very high latent heat, is not evaporated before the inlet valve closes, and the whole of the theoretical fall in suction temperature does not occur in practice.

In Fig. 26 is shown the change of volumetric efficiency with different temperatures in the water jacket of the

cylinder. It will be seen that an increase in temperature of 60 deg. C. (108 deg. Fahr.) caused a fall of volumetric efficiency from 7.40 per cent to 72.2 per cent. It can be calculated from this result that a change of cylinder temperature of 60 deg. C. (108 deg. Fahr.) caused a change of suction temperature of approximately 12 deg. C. (21.6 deg. Fahr.).

Speaking generally, the tests at present carried out with the air-measuring device have revealed nothing new, but they have served to confirm the assumptions made previously as to the variations in volumetric efficiency with different fuels, different compression ratios, and different temperature conditions. They have shown also that the apparatus may be relied on to give consistent results, and have demonstrated that certain phenomena which yet need investigation can be examined by the use of the variable compression engine with this addition.

(To Be Continued.)

SOME tests have been made by the Belgian Colonial Army with Drott surface ignition oil engines of 120 brake horsepower down to 3½ brake horsepower, using palm oil as fuel. It costs 250 francs per metric ton, compared with 2000 francs per ton for mineral crude oil in the Belgian Congo. Fatty acids were completely burned and did not corrode the cylinders. The oil was of 16,610 B.t.u., and the consumptions registered were 310 to 557 grammes per brake horsepower-hour respectively. The exhaust gases were used to liquefy the oil partially. The annual exports of palm oil from West Africa now amount to about 130,000 tons.

# Problems Involved in Tractor Merchandising

Tractors must be sold because they offer the farmer a solution to his particular production problem—not merely as a substitute for horses. Tractor dealers must be educated. The tractor idea must be sold to more people. Constructive propaganda has been lacking in tractor publicity.

**S**ERIOUS marketing problems face the tractor industry. During recent months the National Implement and Vehicle Association has been interested in discussing "marketing conditions, channels of distribution for farm operating equipment, and, incidentally, the factors entering into the increasing cost of distribution." The interest of the association in these fundamental problems indicates that there is a necessity for a study of basic factors in regard to tractor and farm implement merchandising; that extensive changes in method may be necessary to solve the marketing problems of the future for the tractor industry.

In any discussion of tractor merchandising, the dealer must play an important part. The relationship between the dealer and the manufacturer constitutes a major factor in determining success or failure. After reviewing the history of the farm implement dealer in an address some months ago, G. W. Collins said: "I trust that the experience of the years gone by will lead you unquestionably to the conclusion that the implement dealer of the present is a most valuable member of your family—that your interests in a very large measure are mutual, and that the closest harmony in which you can work will be for the greatest benefit of both parties."

A more detailed discussion of the factors involved in dealer relationships was presented several months ago by Arch R. Crawford to the Minneapolis Section of the S. A. E. Mr. Crawford is editor of *The Farmer* and his remarks on "The Present Status of the Tractor Industry from the Standpoint of the Dealer and Farmer" contains much material worth serious consideration. His paper in part was as follows:

Nobody questions the suitability of a specific tractor for a specific purpose. Nobody doubts that the tractor has its place in industry. But enough people are wondering and doubting and criticizing and picking flaws, with or without good reason to do so, so that we believe it is a good thing for us to take stock of what we are doing to make the tractor business the established, permanent and prosperous business we all desire it to be.

Harm has been done to the tractor business by a lot of hasty expressions on the subject and by a lot of hasty assumptions on the part of people connected in some capacity or another with the sale of tractors. The statement by a writer in a scientific publication that a certain size of tractor would replace twenty horses and that therefore on the basis of 30,000 tractors sold in a given year, twenty times 30,000 or 600,000 horses would be released from service on the farm was the rankest kind of nonsense. It was so recognized, branded and brought an immediately apology from the publication.

There have been too many ill-considered statements of this kind. Much ill-effect upon the business has been

produced by people who worked on the assumption that a tractor would replace one horse or two horses or four horses or six horses, if you please, under any given circumstances and at any given time.

**Tractors must be sold because they offer farmers a solution to their farm production problems—not merely as a substitute for horses.**

Now, a tractor may be a necessity for every farm; it may be that somebody can sell a tractor to every farmer; granted that the farmer has the money and that his resistance can be overcome by the salesman. But that does not guarantee that any tractor is suitable for that particular farm, that it will do the work required of it, and will increase the profits of the owner by reducing his production cost.

Blanket theories of sales will not work in selling tractors. They will not get the tractor off the dealer's floor on to somebody's farm, make this farmer a better farmer and the dealer himself a better booster for the tractor business.

Your dealer is conscious of the things I have mentioned. If he has a surplus stock on the floor at the end of the season he is often conscious of a number of things. For instance, a present waning enthusiasm on the part of the tractor manufacturer. Often a failure to back him up with forceful advertising and good, sensible merchandising effort sustained long enough for him to dispose of all his stock. He is inclined to think that the tractor industry may have been expanded too much. He feels that there is too little information available in print, in the movies, in the minds and mouths of salesmen on the comparative merits of power farming and horse-farming methods. That there is a lack of basic understanding of what a given type of tractor is best suited for, or conversely, what type of tractor or what types should be considered logical for a farm of a given size and type in a given territory. He is inclined to think that sales of tractors to dealers in some localities have been forced beyond the ability of the dealer to turn the machines over.

The man who made a total of \$1,000 on his first four tractors in 1920 and who still has remaining two, unsold, in which he has an investment of \$2,400 and who feels himself abandoned until such time as the salesman comes along and tries to sell him six for next year, is not feeling good.

He is liable to criticize anything from the man who invented the tractor to some minor matter of design, such as the fact that if one reaches carelessly into the bowels of the machine to adjust the carbureter, he will burn his hand on the exhaust pipe. You know that numberless minor complaints regarding the design of tractors have

originated in the fact that the dealer was seeking some reasonable explanation for his failure to make sales. He could not, by virtue of lack of training along these lines, sense the fact that the prime difficulty lay in his own lack of general knowledge of the usefulness of the power farming machinery.

In other words, we have not sold the tractor idea to enough people. We have neglected the business of reselling tractor owners and tractor dealers. Now, of a sudden, some folks find themselves shaken somewhat in their faith in the immediate future of the tractor industry and wondering how to remedy the failure to educate in the basic facts and on the technical details of the business, the man who must finally sell the goods, the dealer.

Hampered by the fact that its product is limited to only one size and one type, one of the great tractor manufacturers has already begun to overcome the very difficulties that I have just outlined. They are getting their dealers together and telling them,

First, that tractors must be sold;

Second, that the sales field must be studied in the unit, the dealer made fit to discuss the especial types of attachments suited to that field, and operation, care and economy. In other words, they are training their dealer organization in "Tractor Economics."

The company is following this with service men who help the dealer keep better books, to know what his stock is and to keep it properly displayed, to check up his advertising, to keep him educated and stimulated as a sales outlet for their tractors.

A number of types of tractors have been successfully merchandized for many years and will continue to be sold and stay sold as long as there are farms to be worked and grain to be threshed.

Do not misunderstand me to say that the implement dealer does not know his business. If he did not he would not have been able to survive the years before these last war-prosperity years. Much less would he be in a business on this first day of December, 1920. He does know his business up to a certain point and that point in the majority of cases is the practical application of the tractor to the farming business.

It is up to manufacturers to prove to dealers that advertising has really been planned to help him sell tractors and not merely to get him to buy them.

Having considered the dealers' side of the situation let us turn to that of his customer—the farmer—the man who in the final analysis determines whether or not business shall be "good" or "bad" for you as a tractor manufacturer.

Frankly the average farmer is in a bewildered frame of mind—not panicky, but bewildered. He must be shown before he will invest money in anything. Added to this he has a feeling that farmers are the only class which is really suffering a serious decline in prices.

Unfortunately farmers as a class have not learned to study deeply the subject of economics. National and international conditions which vitally affect agriculture as a whole have little weight in balancing his mind. Still more unfortunate is the fact that many publications, farm and political, are finding it easier to appeal to his prejudices than to serve his best interests, and are simply throwing oil on the fire. It behooves every one of you men to study the editorial contents of farm papers as never before; not for tractor material but to see the sort of advice and counsel now being offered to farmers. Some is sound, but much is written to prejudice rather than help the farmer.

Headlines like the following from the market pages of the newspapers are another source of information which give the farmer little on which to study for causes but plenty to worry over.

"Grains Reach New Low Levels."

"Wheat Tumbles Again."

"Hogs Hit Lowest Mark in Three Years."

"Corn on Toboggan."

"Cattle at 1916 Prices."

"Pre-War Levels Reached."

It is little wonder then that he is bewildered as well as decidedly disgruntled, especially when there are no bold headlines or even small type information concerning lower implement prices.

A large percentage of all tractors bought during the past two years were bought in the hope that they would solve the help problem. With prices high for products of the farm, the farmer could and did take a chance on a tractor in his endeavor to cope with the impossible help situation rather than because he was concerned that the tractor is an economic success.

Only last week one of our subscribers in the Red River Valley was in the office and emphasized this point. He has four tractors and quoted figures on what they have cost him. But, he said, "I don't care, they kept my boys on the land. They like to run the tractors and they won't drive horses."

This particular farmer marketed 3000 bushels of wheat early this fall at the higher price, but is still holding 5000 bushels, and the lower price he will have to take on this latter wheat is forcing him to buy equipment not on the basis of likes or dislikes, but absolutely on the basis of economic results.

#### Farmers' View of Prices

Farmers maintain, and the figures prove their contention, that prices are below cost of production. That nullifies the argument that tractors will increase production unless you can at the same time show him that as a dollars and cents proposition the tractor is an economic success from the standpoint of the user.

Figures as given out by manufacturers get little consideration from the farmer in his present state of mind. The manufacturer of tractors claims his selling price is based on cost of production plus a profit, but the farmer knows that his selling price is far below his cost of production to say nothing of a profit either small or large.

We are not attempting to defend or justify this attitude on the part of the farmer. Rather we are attempting to analyze the elements of sales resistance which must be overcome in order to sell tractors under present conditions.

In this connection permit us to touch on a point that apparently has been overlooked by nearly all tractor manufacturers. That is the lack of constructive propaganda on the tractor as an economic success. The farm press has carried a large amount of tractor advertising but most of it has been under heads like these:

"The Leader of the 1920 Tractor Field."

"A Different Tractor."

"Simplest Tractor Built."

"The Outfit for Your Quality Jobs."

"Power Plus."

"A Complete Power Farming Line."

"They Grip the Ground."

"Principles Proven by Twelve Years of Service."

"Guarantee to Burn Kerosene Successfully."

"The Champion of Engineering Excellence."

"Breaks Work Record."

"No More Plowing for the Horse."

# Belgian and Spanish Car Imports

American cars continue to outsell those from other countries in Spain, but imports fall off in Belgium due to the 20 per cent ad valorem duty. Belgian exports of automobiles show increase

**B**ELGIUM imported 1,934 automobiles, during the first six months of the present year, compared with 2,545 for the corresponding period of 1920. She exported 770 automobiles this year compared with 723 for the first six months of 1920.

The figures for January to end of June 1921 are the first to appear since the new Belgian 20 per cent ad valorem duties went into effect. The outstanding feature of these statistics is the drop in business done by American firms. Whereas 1,033 American automobiles came into Belgium in the first half of 1920, only 225 were imported this year. One of the results of the new law has been to encourage the importation of chassis only, which receive a Belgian body. This of course does not apply to the cheaper American cars, nor to such cheap European types as the Citroen, Renault and Fiat, which are practically always sold with standard body.

France is doing by far the biggest business with Belgium, the number of automobiles imported in the first six months of this year being 1060. Italy comes second with 342 cars. This number was artificially increased by a big importation of the popular 10 h.p. Fiat just before the higher tax duties went into effect. Germany is becoming rather important on the Belgian market, her imports being 202 and 327 for the first six months of 1921 and 1920 respectively. Benz and Mercedes are the leading figures in this business. England is losing ground, having dropped from 89 to 27 automobiles. She maintains a stronger position in the bicycle and motor cycle lines. Holland possessing only one automobile manufacturer, the 50 cars sent from that country to Belgium need explaining. A large number of these were French cars which had been re-exported from Holland to Belgium.

The following figures cover the Belgian imports and exports for the first six months of 1920 and 1921.

	Imports Into Belgium		Exports from Belgium	
	1920	1921	1920	1921
Germany .....	327	202	7	35
Spain .....	...	...	73	61
America .....	1,033	225	3	15
France .....	846	1,060	46	72
Great Britain .....	89	27	283	171
Italy .....	173	342	2	...
Holland .....	24	50	173	142
Portugal .....	...	1	62	9
Other countries .....	43	27	74	265
Total for six months..	2,545	1,934	723	770

Great Britain is the best individual client of the Belgian automobile industry, 171 automobiles having been sent to that country this year and 283 in the first six months of 1920. Germany took 35 automobiles, compared with 7 during the earlier period, but a certain number of these were for the Allied forces in Germany. Business with Spain and Portugal has dropped, this being attributed to German competition. The United States purchased 15 Belgian automobiles in the first half of this year, compared with 3 last year.

During 1920 Belgium imported 4,460 automobiles and exported 1,848 chassis or finished cars.

## Spanish Automobile Imports

American cars continued to outsell those of other countries in Spain during 1920, 5782 American built cars were imported into Spain during that year. The import figures given below show in detail the cars imported into Spain during the last three years. These numbers practically indicate the number of cars sold in Spain during that period, since domestic manufacture is almost negligible in Spain:

# Restoring Craftsmanship Pride to the Worker

Interest in work varies with the degree of visible accomplishment—The longer a man has been operating under routine conditions, the more difficult it is to restore the spirit of craftsmanship. The greatest difficulty in modern industry is lack of opportunity to satisfy the creative instinct.

By Harry Tipper

**W**HILE I was spending a week or two away from the office and from any connection with business affairs, I came across a lady who had been in charge of occupational work at the reconstruction hospitals. At these places the wounded soldiers are given various occupations in cases where they have been incapacitated for their previous work or where there is a therapeutic value to the occupations themselves.

The lady had no experience in industry as we know it in the modern factory system, but she was skilled in the craftsmanship of wood carving, basket weaving, and tapestry work.

Many of her stories were extremely interesting apart from the suggestion they offered to industry, and they made me wish some of the thinkers among the executives in industry had been associated with this kind of work.

The men who had learned their new work at the hands of this lady came from all lines of interest and from many different ranks in business. The unskilled laborer, the automobile mechanic, the machine tender, the office clerk, and so on, were among her students.

Being an observant woman, she noticed many things in her work, some of which puzzled her considerably.

In the course of conversation she said: "I wish you could have heard them talk about their industries, the jobs and the bosses they had had. Most of them were very worth while and, of course, much that they said was in entire ignorance of the real state of affairs.

"It was the first time I have been in intimate contact with workers of all kinds and their reactions to their work and industry were very definite.

"It made me see how conflicts arose in the industrial field. What I could not understand, however, was that the same men who could think of nothing more important than less hours and more pay in their previous jobs, would be lined up before the door of my shop before I opened it in the morning and could hardly be kept away when the door was closed at night, and they were just as proud of their work as they could be."

Of course, the interest in the work which she had observed was due to the visible accomplishment of the work. There was a sense of craftsmanship, of creation, and of visible accomplishment in this work, which had been denied them in the ordinary work in industry. This sense of accomplishment overcame all ideas about hours and they forgot even how much the work was worth in the satisfaction of doing it.

In these cases the men had been rudely shaken out of

their ordinary routine and they were suffering from the prospect of being unable to return to their ordinary work, so that it was possible to create a spirit of craftsmanship much more rapidly than under normal conditions.

Nevertheless, when the man got through choosing the reed for the particular job he was doing, laying out the work, finishing the basket, the results of his work were entirely visible to him, the mistakes of his work were equally emphasized and the possibilities of improvement suggested.

**The most important difficulty in modern industry is this lack of craftsmanship, the sense of visible accomplishment, the individuality and responsibility for the work, and a sense of proprietorship in the product which has been made.**

In occasional instances something has been done in this respect in the individual factory and the result has been remarkable in its effect upon efficiency.

The way in which interest governs the character, the accuracy, and speed of the work has not been sufficiently considered.

One of the instances mentioned in the conversation I have spoken of showed the force exerted in the work, by the interest itself. One of the men who was taught wood carving had his right hand so badly paralyzed that he could not close it and it was necessary for him to use a large lump of beeswax so that the tool could be held. Gradually the muscles of the hand began to function until the beeswax could be thrown away. The intensity of interest and the unconscious effort to gain skill and accuracy because of the interest had its effect upon the whole physical co-ordination.

**The reverse is true and unconsciously we find our systems of industry producing a mass of materials, but requiring more inspection, more supervision, and more constant attention, because the interest is not developed and the accuracy and skill are not improved materially under the conditions.**

In the August number of *The Rotarian* there is a statement by Mr. Charles Gates of the Gates Rubber Company, called to my attention by a subscriber to *AUTOMOTIVE INDUSTRIES*. This statement is worthy of the consideration of every manufacturer. It is quoted below.

"Restore to the worker—the man or woman in your office, your store, or your factory—one of the greatest gifts that man can possess—the pride of craftsmanship, the feeling of individual or collective responsibility, and the sense of proprietorship.

"You can do this, no matter what your business, and

it will increase your production. It will give birth to creative ability that has never before expressed itself. It will cut your costs and it will pay dividends both to you and to your employees. And, more than this, it will elevate the intellectual, the moral and the spiritual level of your whole organization.

"When you have given back to your workers the opportunity to express that pride of craftsmanship that will mean more to them than the gifts of thousands of dollars, you will have performed a service to mankind that will do more to lift the moral stan-

dard of humanity than all the preachments of the past fifty years, and it will come nearer to the realization of a true spirit of democracy than has existed in this country since the signing of the Declaration of Independence."

It is interesting to note that as a result of the deliberate attempt to put this idea into practice, the individual production jumped from 60 per cent in 1919 to over 80 per cent in 1920, and this manufacturer is enabled to keep up his volume of business and his percentage of profit with a smaller organization.

## New 1-Ton Bevel Gear Axle

A 1-TON bevel gear-driven axle for speed trucks has been brought out by the Clark Equipment Co., manufacturers of internal gear driven truck axles. This new member of the Clark line is known as Model B-21.

A feature of the design is the short pinion shaft, which reduces the overhang of this member, which has a straddle mounting. The entire shaft assembly is mounted on a pinion carrier which can be easily removed from the axle. A Brown-Lipe differential is used.

The weight of the axle, inclusive of wood wheel hubs, brake drums and bearings, is 380 lbs., while the allowable load on the spring pads is 3500 lbs.

Various gear reductions can be furnished, the maximum being 6.25 to 1. There are both internal and external brakes acting on the rear wheel drums, which latter are 16 in. in diameter. The internal brake bands are 1½ in. wide and the external bands 2½ in. With 36 in. tires a road clearance of 10½ in. is obtained. Spring centers vary from 38½ to 40 in., 39½ in. being standard.

The axle is designed for the Hotchkiss drive. The drive is by spiral bevel gears with seven and 44 teeth of 3.48 diametral pitch and 1 5-16 in. face. The pinion is formed integral with its shaft. The drive shafts are of nickel steel, 2 in. in diameter at the wheel end and 1 9-16 in. at the differential, both ends being splined. The propeller shaft forward end is machined for an S. A. E. No. 6-B spline joint 1¾ in. in diameter.

Both brake levers are located inside the springs. The wheel hubs are 9 in. in diameter and are designed for 14-spoke wood wheels. The bearings are of the non-adjustable type and are said to be of unusually large capacity. The brake drums are piloted on the rear hubs and are secured in place by bolts which have their nuts on the outside of the spokes, so that the drums can be readily removed in case of need. Hard felt washers are used at various points of the axle for the exclusion of dirt and the retention of lubricant.

The wheels are said to be readily removable and re-

placeable, and they are so arranged that they can be put on only one way. All nuts are locked either by cotter pins, lock rings or lock washers. The wheel bearings are designed to take thrust in both directions, this practice being considered preferable to that of transmitting the thrust from the inside through the shafts to the bearing on the opposite side, as is commonly done in passenger car axles.

## Wire Wheel Demountable at Rim

SOME time ago the Hayes Wheel Co. perfected a wood wheel with steel felloe in which the loose wedge was eliminated and fixed lugs securely fastened to the rim used instead. This type of wood wheel has been adopted by several large manufacturers of motor cars.

Now the fixed lug construction has also been applied to wire wheels. The same kind of steel felloe and the same kind of demountable rim are used, and the new Hayes wood wheel rims are interchangeable with the new wire wheel rims. The attached lugs on the wire wheels are claimed to do away with loosening of the spokes and with throwing the wheel out of round.

The following advantages are claimed by the Hayes company for its new product: In mounting the rim the full pulling power of each lug bolt can be exerted in drawing the rim to the felloe, and only one-half the number of bolts otherwise required are needed; each lug bolt also becomes a driver, preventing slippage of the rim; there are no loose lugs and misalignment of rims is impossible, which means longer tire life.

At present the wheels can be supplied only for Fords and Chevrolets 490, but they will soon be available for other makes also.

Hayes wire wheel with demountable rim

## A Bureau of Civil Aeronautics

A COMPREHENSIVE bill to provide for a Bureau of Civil Aeronautics has been introduced in Congress by Senator Wadsworth. The bill provides for the control, regulation and development of civil aviation by the Bureau under the Department of Commerce.

This measure constitutes perhaps the most constructive effort yet made in this country to place the development of our commercial aviation on a sound basis. Other countries have already gone far in regard to such developments. In France a complete system of landing fields has been developed and regular passenger service is being successfully provided. Government efforts have made possible this development over there.

While the proposed bureau is to have supervision of all phases of aviation matters, provided the bill is adopted, perhaps the most important of its immediate functions would be the development of proper landing fields and air ports throughout the country. Civil aviation is dependent upon the facilities for

landing to a very large extent and it is in this direction that least has actually been accomplished in the United States.

The disseminating of weather reports and operating signals for aviators is another immediate function which such a Bureau would assume in addition to that of inspecting and laying out air routes and the establishment of air ports and terminals. The establishment of such a Bureau would be a definite step in advance for American civil aviation.

## Producer Gas as Automotive Fuel

AMONG the fuels which have received consideration during the last several years as possible substitutes for gasoline in internal combustion engines is producer gas, which is extensively used for industrial purposes. Some ten years ago attempts were made in this country to develop producer gas plants for use on motor boats. This enterprise did not prove a success, probably because in any kind of pleasure craft the dirt always associated with solid fuel is a great objection. The present movement to develop such plants originated in England during the war, when gasoline was practically non-available for private purposes.

Naturally, solid fuels are far less convenient to handle than liquid fuels, as they cannot be fed automatically in the exact proportion required by the engine. Moreover, for a certain amount of heat energy they occupy much more room. On the other hand, producer gas from hard coal or coke is a considerably cheaper fuel than gasoline, especially in countries possessing no oil wells. Some of the advantages of operation are also on the side of gas, as there can be no difficulties of distribution and no crankcase dilution, and there are, moreover, no unusual starting difficulties in winter time. The water could be kept from freezing by dissolving alcohol in it; as comparatively little water is used and as the fuel value of the alcohol would be utilized, there would be very little added expense due to the need for an anti-freeze solution.

In considering the advantages offered by producer gas obtained from anthracite or coke, it is quite natural to make a comparison with the use of these same fuels in steam trucks or tractors. Twenty years ago the steam system would have had a practical advantage in that then many more people were familiar with steam than with the internal combustion engine. To-day the situation is reversed. One of the great objections to the steam system using solid fuels is the development of smoke. It appears from work done so far that a producer gas plant can be made much lighter than a steam plant of equal output, and there is less need for automatic devices on the gas power plant than on the steam plant. Finally, when solid fuel is used, the thing aimed at mainly is fuel economy, and it has been shown in stationary practice that the cost per horse power hour in small units is much less with producer gas than with steam produced with the same fuels.

In a series of articles beginning in this issue the theory of the use of producer gas and the systems which

have been developed in England in recent years are discussed.

The one thing that will bear watching on trucks driven by producer gas power is their behavior in dense traffic. As the draft from the engine stops when the engine is stalled, there is a tendency for the fire in the producer to die down and gas production to stop, which would be likely to make quick acceleration impossible. By means of the blower always carried on trucks equipped with producers, the fire can of course be kept up, but in congested traffic the driver is generally so occupied that he can give little attention to the blower.

## Present Human Problems

**R**EFUSING to address a certain group of American labor, Bernard Shaw is quoted as saying that labor needs to hear all sides of the case in order to have a fair understanding of the entire industrial situation; that one of the greatest defects in labor at present is its lack of knowledge and understanding of the case of the employing and capitalist classes. He is quoted as suggesting that this group get Marshal Foch to speak to them, since he believes they would find themselves in agreement with him on many points, were they really to understand his views.

The limited newspaper reports of Shaw's refusal do not give sufficient evidence to determine whether or not he meant what he said or was playing at his favorite pastime of meaning exactly what he doesn't say. Taking the opinions at their face value, however, much sound common sense is revealed.

Many of the labor difficulties which have accrued to some automobile manufacturers in the past have been due to a lack of honesty and frankness in dealing with workers. In a few cases perhaps this lack of frank contact was intentional; in most cases, however, it has been the result of a type of indifference. The manufacturer has been too busy with other things; he has not considered the task of getting his workmen to know the company of sufficient importance to warrant careful study and studious investigation. Too often the task has been intrusted to house organ editors utterly incapable of even sensing the problem, let alone handling it effectively.

Even some of those employers who did give serious attention to this problem for a time during the period of acute labor difficulties are no longer interested. They seem to feel that the problem has gone. It is true that temporary conditions render the labor problem no longer acute; but the lack of surface trouble is no indication that the inherent difficulties are not still present.

The employer who senses this fact and who recognizes the present as a time specially suited for studying the details of the human problems in his plant, especially those phases which relate to details of production, will lay up for himself a store of future profit. The average workman is in an excellent frame of mind to-day to be approached by the employer. Equipped with a fundamental sincerity of purpose, the employer to-day has an opportunity to study and to build constructively in the human phases

of his production. The reflex from present methods in this regard will show up some months hence.

## Noiseless Cars

**T**HE ideal car is one which is silent in operation, not only so far as the operating mechanism is concerned, but one in which the exhaust is silenced and whose passage over the road is noiseless, even when the going is rough. This ideal is approximated in some of the higher grade cars when they are new, but there is much room for improvement in the less expensive makes, while even the higher priced jobs are far from noiseless after a few months of use.

Much money and effort has been spent by many manufacturers in building engines which are practically noiseless, and the majority of engines are open to relatively little criticism in this regard. The remainder of the car has not kept pace in this regard. Many gearsets are far more noisy than there is need for their being if a little more care were given to their design and construction, while starting gears almost always offend the ear during the brief periods they are in use. So far as the rear axle is concerned, the quite general use of spiral bevels has improved conditions to a marked degree.

In the rest of the chassis and in the body there is, however, a great need as well as possibility for improvement. Spring shackles, especially after they have become slightly worn, are the source of much preventable rattle. Some manufacturers are seeking to eliminate this very general defect by better designed shackles, some of which have means for taking up wear either by springs or by positive adjustment. This is a step in the right direction, but there is reason to believe that it is entirely feasible to eliminate the spring shackle and provide in its place a flexible or yielding member which cannot rattle. One prominent truck manufacturer has completed successful experiments in the use of rubber blocks of special design in place of shackles, and is regularly equipping his product with these so-called "shock insulators," which will be described in an early issue of AUTOMOTIVE INDUSTRIES. These blocks are said to render the vehicle much less noisy and to greatly improve its riding qualities; besides which they require no lubrication or other attention on the part of the user. Further experiments in this direction seem highly desirable.

Among other parts which cause unnecessary noise are brakes and brake connections (especially external band brakes), front axle steering connections, sheet metal parts, such as mudguards, splash guards and underpans; license plate brackets and lamps; doors and other body parts and body hardware. All of this, and much other noise can and should be eliminated. In many cases a little more care in assembly or thought in design will produce the desired results with but slight if any increase in cost. The fact that a car is noiseless in operation is at least an excellent sales asset—a tangible quality which every owner would appreciate and from which the manufacturer would profit accordingly.

# Factories Set Fast Production Pace

## September Business Will Exceed August

### Ford, Dodge, Buick and Studebaker Lead in August Output Records

DETROIT, Sept. 6—Under the leadership of Ford, Dodge, Buick and Studebaker business in September is expected to run considerably ahead of August in the passenger-car field and probably will show a slight betterment in the truck field, owing to development of light delivery truck buying.

August production held very close to the marks set in July. Manufacturing in all plants was practically on a sales basis. Some reported a falling off from July totals, but others reported improvement.

Ford led all others in improvement over July, the August total of 117,696 being the highest production mark yet reached. This is capacity production, practically for all plants and assembly stations and under the impetus of the new prices it is believed this figure will be equalled or exceeded in September.

Dodge is continuing at the rate of 550 cars daily and orders are said to be far enough in advance to continue this pace to the first of the year.

Studebaker continues at maximum monthly production of 8900 cars and reports no indication of a let-up in orders.

Buick led all General Motors units with an August production of 11,750 as outlined. The same pace will be held in September.

Oldsmobile has stepped up its production schedule for September to 80 daily, being influenced in this by the rush of orders following announcement of new prices.

Cadillac will hold its schedule of approximately 75 daily for September.

Oakland ran 25 per cent ahead of July in its August production and looks for a similar gain in September. The company reports its new sport model getting a large share of business.

Scripps-Booth will continue its schedule of 25 daily for the present.

Reo Motor Car Co. reports 100 per cent production in August, the month being its third biggest since it began business. The same production totals or better are looked for in September, the business being divided evenly between passenger cars and speed-wagons.

Briscoe Motor Car Co. reports August business of 30 daily with the same schedule outlined for September.

Handley-Knight looks for a 50 per cent better business in September than in July or August.

Barley Motor Car Co. will increase its output in September.

Saxon looks for increased sales in September owing to increases in its dealer organization and reports from its investigators in the field.

Columbia Motors business increased in August and further increases are looked for in September. Announcement of its new models and prices brought a rush of orders which is continuing.

Hupp will step up from an August production of about 1500 to a September output of 2000.

Paige, operating in August on a 65 per cent basis, looks for a decided improvement in September.

Hudson-Essex beat its July figures slightly in August and looks for a real increase in September.

Lincoln with a production of 225 in August plans to build 275 in September.

Jackson Motors, operating in August at less than half of capacity, will step up in September.

Dort Motor Car Co. has started a series of fall openings in its distributor territories which will run into October. These are expected to carry business to new high marks in the fall months. August business was on a par with July.

Packard Motor Car Co. will reopen Sept. 10 after a two-weeks' vacation period. Orders are reported running high on its twin six and single six cars and production will be speeded up when the factory reopens, to meet demand. Truck business is light but showing more life than for several months.

## Dealer Says Business Is Brisk in Manila

SAN FRANCISCO, CAL., Sept. 6—The automobile business in Manila is brisk, roads are fairly good and more are being built, but the great drawback to the handling, distribution and service of cars is the inability to get competent mechanics at any salary. This is the interesting statement of O. Porter, who has been in the automotive business in Manila for fifteen years, and returned late in August to San Francisco for his first visit to the United States in 22 years. He said:

"In Manila I handled several makes of cars, having sometimes as many as 150 new and second-hand cars on hand. When I sold out a few weeks ago, I had 60 cars in the store. Roads in the islands, speaking generally, are good; better, in fact, than those I saw on the way here from Vancouver. The automobile business in Manila is brisk, but the one drawback is a lack of mechanics. The last few years, however, has developed a few good native mechanics, and this supply may increase as time goes on."

## Air Control Bill Up After Recess

### Will Be Considered When Congress Reconvenes—Senator Wadsworth Gives Details

WASHINGTON, Sept. 7—The bill providing for a Bureau of Civil Aeronautics in the Department of Commerce introduced by Senator Wadsworth, was referred to the Senate Committee of Commerce and will be taken up for consideration at the end of the recess. The measure provides for the control, regulation and development of civil aviation in accordance with the recommendations made by President Harding in his inaugural message. It would provide commercial flying with a centralization already possessed by the air services of the army and navy. In introducing the bill, Senator Wadsworth said:

"Through control, regulation and development, civil aviation can make a real contribution to our transportation needs, particularly in the carriage of mail, and at the same time provide an economical and indispensable reserve for the military and naval services.

"Already 1,200 commercial aircraft are in operation, but due to the lack of Federal control there were 40 serious accidents in civil aviation the first six months of the year in which 14 persons were killed and 52 injured.

"Of equal importance with the inspection and laying out of air routes is the establishment of terminals and the provision of means for disseminating weather reports and operating signals for aviators—all provided by this bill.

"This bill is also designed to correct a curious and extraordinary situation that is developing in customs and quarantine. Smuggling of persons and goods—including liquor—is easier by air than by many other methods, and contraband flying cannot be controlled except by special law with all the force of the Government behind it.

"This bill was prepared in response to the urgent solicitation of a score of organizations throughout the United States representing the operating, engineering, constructing, commercial and sporting elements in aviation. Its early enactment is imperative as a means of saving life and property, aiding our economic development and strengthening our national defence."

## NEW RANGER MODEL

HOUSTON, TEX., Sept. 6—The Southern Motor Mfg. Assn., Ltd., is now at work on the production of a six-cylinder model. This will be known as the Ranger, having the same name as the previous four-cylinder model, which has been on the market for some time. The new six will be fitted with a number of different style bodies, including both sport and conservative designs.

# Robert Bosch Magneto Incorporates

## Heins Heads German New York Company

### Will Manufacture on Old Patents Pending Result of Suits Against A. Mitchell Palmer

NEW YORK, Sept. 7.—The Robert Bosch Magneto Co., Inc., which has been incorporated at Albany with a capital of \$250,000, has opened offices in the Goodyear Rubber Co. Building, at 123 West 64th Street. Otto Heins, who was president of the Bosch Magneto Co. before it was taken over by the alien property custodian and reorganized into the American Bosch Magneto Corp., is president of the new corporation.

#### Await Suit Outcome

Heins has a suit pending against A. Mitchell Palmer, former alien property custodian, and officers of the American Bosch Magneto Corp. for the return of the property and patents on the ground that fraud was practiced in their sale. Pending the outcome of the litigation for the return of the original Bosch property and patents, Heins says the new company is going ahead with the manufacture of magnetos on the old patents.

Harvey T. Andrews, attorney for Heins in his action against Palmer, is secretary and general counsel of the new company. He does not deny that the American holders of the patents may sue for infringement of their rights when the new company begins production of Bosch magnetos, but in this connection he contends that the purchasers of the patents at the sale by the alien property custodian paid only \$1 for the patents.

"Under these circumstances," Andrews said, "it would be interesting to find out what part of that amount, if any, would finally be allowed by the court as damages, assuming that the present holders of the patent sue for infringement and that they are successful in such a suit."

The treasurer of the new company is Guenther Jahn, who was a stockholder and an officer of the original Bosch Magneto Co.

#### Heins German Citizen

Heins is a German citizen and an engineer of long experience. He organized the Bosch Magneto Co. in this country with a small capital and asserts that he controlled the company at the time it was seized by the alien property custodian although Palmer contended that the stock actually was owned by Germans living in Germany, chiefly by Robert Bosch.

Heins has not selected a factory site but says he is considering several plants

already built. According to his statement, the new company will manufacture magnetos, spark plugs, starting and lighting systems for automobiles, airplanes and motorboats as well as other electrical devices.

#### Plans Competition

It is the purpose of the Robert Bosch Co. to compete with the American Bosch Magneto Corp. and it will offer for sale magnetos manufactured here and also in Germany. The Germans claim to be able to manufacture such articles more cheaply than they can be made in America. The company also claims to have a new Bosch invention for use in low priced automobiles. This is a combination battery and ignition system. It also will offer a new Bosch electric lighting system for high priced cars. Heins has filed applications for new patents in the patent office at Washington.

## Grand Jury May Probe Revere Motor Affairs

INDIANAPOLIS, IND., Sept. 6.—Paul M. Souder, judge of the Cass Circuit Court, will be requested to call the Cass County grand jury in session at Logansport, Ind., during the September term of court, to investigate various rumors and allegations regarding the Revere Motor Car Corp. The prosecuting attorney asserts that the question of the return of Newton VanZant, formerly president of the Revere Motor Car Corp., wanted on a charge of grand larceny, would have no bearing on his determination to make the request. The charges against VanZant were filed by John B. Porter, a stockholder, in connection with sale of stock. A damage suit for \$10,000 against VanZant has also been filed by Porter.

The Citizens Loan & Trust Co. of Logansport, receiver for the Revere Motor Car Corp., has filed a cross complaint asking \$7,500,000 damages against the Revere Motor Sales Co., Inc. In its original suit, the sales company asked \$500,000 damages for alleged failure of the manufacturing corporation to live up to a contract under which it was to supply 3000 cars a year for five years.

## Philadelphia May Get Fokker Plane Plant

PHILADELPHIA, Sept. 5.—Philadelphia expects soon to have a branch of the Fokker airplane factory of Holland. A representative of the Dutch company, H. P. French, has been conferring with leading men here interested in aviation on the prospects of establishing a plane plant here.

There has not been any definite plan proposed as yet.

## Engineers to Visit Big Proving Ground

### S. A. E. Members Will Be Guests of General Williams October 7th

NEW YORK, Sept. 7.—The Washington, Pennsylvania and Metropolitan sections of the Society of Automotive Engineers, together with members of the parent organization, will visit the Aberdeen Proving Ground on Oct. 7 at the invitation of Major General Williams, chief of ordnance. Members of the American Society of Mechanical Engineers and the Army Ordnance Assn. will be members of the party. The invitation of General Williams provides an unusual opportunity to note the progress made recently in the development of guns, projectiles, bombs, aircraft and mobile mounts. The meeting will last all day.

Several announcements of section meetings for the fall have been received at the headquarters of the S. A. E.

The Dayton section expects to hold its first fall meeting about Oct. 1. The subject to be considered will be radiation.

The Detroit section will hold meetings on Sept. 23 and Oct. 21. One of the most important subjects to be considered will be the fuel problem.

While the Midwest section has not decided on dates, there will be a series of meetings in Chicago for the discussion of thermodynamics, principles of carburetion, combustion phenomena and the fundamental losses in internal combustion engines.

The Indiana section will hold a meeting on chassis design in Indianapolis, Sept. 23.

The Metropolitan section will hear on Sept. 15 a synopsis of the papers presented at the fuel session of the society in May.

The Minneapolis section will have sessions during the season on manifold design and fuels, tractor wheels and traction, steam power for farm tractors, road building machinery and engineering, power cultivation, tractor publicity and demonstrations.

The New England section will follow the custom established last year of holding meetings in various cities throughout its territory. The first will be an outdoor meeting in Worcester, Sept. 17.

The Pennsylvania section will open its season with a meeting at the Torresdale Golf Club the afternoon and evening of Sept. 22. Sports will occupy the afternoon and after dinner there will be a brief discussion of some of the more important papers presented at the meeting of the Society in May.

## Big Drop in English Trade in 7 Months

Export and Import Figures Are Lower Than Same Period in 1920

LONDON, Aug. 26 (By Mail)—July's automobile trade returns in Britain reflect the effect of the thirteen weeks of the coal trade's cessation. England imported 318 cars, 382 chassis, 133 trucks, 78 motorcycles, having a combined value of \$1,100,000. The month's import of chassis parts had a value of \$721,000, of motorcycle parts \$74,400, and tires \$1,772,680.

The shrinkage in the month's import is sufficiently indicated by noting merely the corresponding numbers for July, 1920. They were as follows: Cars, 2,325; chassis, 1,116; trucks, 1,290; and motorcycles, 666. The shrinkage in value of the chassis parts imports was as 5 to 1; of motorcycle parts as 3 to 5; and of tires as 3 to 5.

The following figures show the relative gross imports for the seven months ended July, 1920, and July, 1921, respectively: July, 1920, figures being given in brackets: Cars 3113 (15,779), chassis 2315 (7792), motorcycles 2024 (6681) while the value of the parts and tire imports for the seven months were: Chassis parts \$9,741,065 (\$21,374,000), motorcycle parts \$439,000 (\$321,200)—there is an increase on this head—and tires \$9,560,000 (\$15,475,000).

British automobile exports for July were: 93 cars (401), 77 chassis (341), 71 trucks (97) and 646 motorcycles (2641), the figures in brackets denoting the corresponding number in 1920. The month's value of British export chassis parts was \$428,110 (\$1,183,600), motorcycle parts \$120,000 (\$336,150), and tires \$538,500 (\$3,618,000), the bracketed figures, as before, denoting the corresponding month's value in 1920.

The gross value of British automobile exports for the seven months was: Cars \$5,561,000 (\$5,558,000), chassis \$3,546,000 (\$4,837,250), trucks \$2,150,125 (\$2,011,730), motorcycles \$2,500,000 (\$3,925,000), chassis parts \$4,317,000 (\$5,428,190), motorcycle parts \$1,028,635 (\$1,694,000), and tires \$6,529,000 (\$20,000,000), the figures in brackets being for the seven months corresponding, 1920.

## Gibbes, Well Known Distributor, Is Dead

COLUMBIA, S. C., Sept. 6—A. Mason Gibbes, head of the Gibbes Machinery Co., Packard, Paige and Durant distributor in South Carolina, died suddenly in his office to-day. Gibbes, whose company did an extensive machinery and foundry business as well as wholesaling and retailing automobiles, was one of the strong men in the industry in the Southeastern States. He was one of the organizers and first president of the South Carolina

Automotive Trade Association, and was holding the office when he died.

Gibbes had been influential in bringing about legislation in his home state favorable to the industry and through Senator Dial of South Carolina had exercised considerable influence on Federal legislation. He had done a great deal of work to help elevate the tone of the trade in his home state. He was 44 years of age. A brother, Frank H. Gibbes, had been associated with him in the affairs of the company.

## G. B. Bell Named Chief of Vehicle Division

WASHINGTON, Sept. 6—The appointment of George B. Bell of Jamaica, New York, as chief of the Agricultural Implements and Vehicles Division of the Bureau of Foreign and Domestic Commerce was announced to-day. This is one of the new commodity divisions. Bell has had wide experience in the agricultural implements field. He was with B. F. Avery & Sons of Louisville, Ky., engaged in export work for twenty years.

## Canada Will Issue Trade Certificates

OTTAWA, ONT., Sept. 7—The government has been empowered to institute a system of certificates to be attached to all invoices of foreign goods imported into Canada. It is proposed to charge a fee of \$2.50 for certificates on invoices of \$100 or over, these certificates to be signed by a Canadian trade commissioner, British consul or other person duly authorized.

Canada spent \$240,000 in paying expenses of the various trade commission officers and received nothing in return during the year. The United States Consulate during the same time spent about \$270,000 and received in fees something like \$500,000 from Canada's exports of about \$500,000,000.

## Bassick-Rimtco Suit Is Settled Amicably

NEW YORK, Sept. 7—The difference over the patent rights between the Bassick Mfg. Co. of Chicago, manufacturer of the Alemite system of lubrication, and the Rhode Island Machine & Tool Co. of Woonsocket, R. I., manufacturer of Rimtco high pressure system of lubrication, has been settled. The Rimtco gun will be manufactured as heretofore, but under an agreement with the Bassick company, which gives the former full rights to manufacture and sell the Rimtco pressure grease gun.

## F. R. BLAUVELT DIES

NEW YORK, Sept. 7—Frank Remington Blauvelt, first vice-president of R. K. Carter & Co., buyers for jobbers of automotive supplies, died here this week. He spent most of his business life in the hardware trade. He traveled extensively all over the country.

## Steady Increases in Tire Production

Rubber Association Figures Show Manufacture Heavier with Decline in Stocks

NEW YORK, Sept. 6—Statistics compiled by the Rubber Association of America on tire production, shipments and inventory, for the Department of Commerce, show a steadily increasing volume of manufacture and an equally steady decline in stocks on hand. The figures by months since November, 1920, which is taken as the base month, up to August, follow:

PNEUMATIC CASINGS			
1920	Inventory	Production	Shipments
Nov. ....	5,880,016	649,742	806,023
Dec. ....	5,508,350	506,111	1,327,153
1921			
Jan. ....	5,319,605	703,430	965,417
Feb. ....	5,193,018	819,892	1,073,756
Mar. ....	4,597,103	1,163,314	1,614,651
Apr. ....	4,527,445	1,651,418	1,785,951
May ....	4,451,668	2,100,917	2,085,882
June ....	4,154,456	2,313,265	2,643,850
July ....	3,892,037	2,570,524	2,757,581

INNER TUBES			
1920			
Nov. ....	6,131,935	742,815	920,938
Dec. ....	5,786,929	508,446	1,481,285
1921			
Jan. ....	5,586,163	740,824	1,042,617
Feb. ....	5,415,464	916,627	1,129,881
Mar. ....	5,044,861	1,346,483	1,643,690
Apr. ....	4,916,772	1,762,122	1,983,571
May ....	4,751,880	2,210,040	2,342,567
June ....	3,835,098	2,359,928	3,232,673
July ....	3,122,815	3,020,981	3,603,248

SOLID TIRES			
1920			
Nov. ....	298,875	21,355	34,217
Dec. ....	303,473	16,297	40,828
1921			
Jan. ....	303,753	21,220	29,116
Feb. ....	304,374	23,365	29,599
Mar. ....	283,800	28,710	43,926
Apr. ....	269,985	28,859	42,080
May ....	264,633	35,156	40,122
June ....	240,336	28,395	49,867
July ....	220,003	35,123	55,678

"Production" and "Shipments" figures cover the entire month for which each report is made. "Inventory" is reported as of the last day of each month.

"Inventory" includes tires and tubes constituting domestic stock in factory and in transit to, or at, warehouses, branches (if any), or in possession of dealers on consignment basis, and as a total represents all tires and tubes still owned by manufacturers as a domestic stock.

"Shipments" includes only stock forwarded to a purchaser and does not include stock forwarded to a warehouse, branch, or on a consignment basis, or abroad.

## NO TAX PENALTY FOR LABELLE

WASHINGTON, Sept. 7—Under Treasury decision 3220, dated Aug. 26, but made public this week, taxpayers in the automobile industry who included "appreciation" in invested capital contrary to the recent decision of United States Supreme Court in La Belle Iron Works case may file amended returns within ninety days and pay taxes without penalty. There had been some question as to penalties but the Treasury ultimately decided on this liberal policy.

## PREST-O-LITE BATTERY CUT

NEW YORK, Sept. 6—Prest-O-Lite Battery Co. has announced a new price. The new price is \$23.50, a reduction of \$12.40. The old price was \$31.15.

## N.A.C.C. Will Present Legislation Views

### Members to Meet Law Makers on Highway, Taxation and Re- imports Measures

NEW YORK, Sept. 6—The National Automobile Chamber of Commerce has sent to its members a bulletin calling their attention to the fact that the month's recess taken by Congress will give an opportunity to meet members of both houses in person and present views on legislation which will be taken up during this session. From the viewpoint of the automotive industry the most important measures are:

1. The Phipps-Dowell-Townsend highway bill which has been passed by the House and Senate and now is in the hands of conferees. The measure as it stands carries an appropriation of \$75,000,000 for one year for main highways.

2. The taxation bill which has been passed by the House and is now in the hands of the Senate Finance Committee. As the measure now stands it does not remove the excise tax on automotive vehicles, tires, parts and accessories.

3. The Graham bill which provides for the imposition of a 90 per cent ad valorem duty on all American made goods exported for use by the American Expeditionary Forces or allied governments, sold to other governments by the United States Liquidation Commission and later sold to speculators who have been reimporting large quantities to this country including motor trucks and passenger cars. The measure was passed by the House and reported favorably by the Senate Finance Committee with an amendment which would limit its effect to goods purchased after Aug. 15 and reimported after Nov. 1, 1921. Passage in the Senate under unanimous consent was prevented by objections by Senators Pomerene and Hitchcock.

4. The Dyer Motor Vehicle Theft Act which was passed by the Senate and reported favorably by the House Judiciary Committee, but passage by unanimous consent was prevented by Representative Mann of Illinois.

5. The tariff bill which would reduce the import duty on automobiles to a uniform rate of 25 per cent and which would provide for a 5c. per pound duty on aluminum instead of placing it on the free list or retention of the present duty of 2c. per pound asked by the N. A. C. C.

### Ford Statement Shows \$54,844,538 in Cash

LANSING, MICH., Sept. 6—The Ford Motor Co., according to a statement filed with the Department of State, had \$54,844,538 cash on hand and in the bank at the close of business on June 30. Its plant, including land, buildings and improvements, was valued at \$46,926,010, machinery and equipment at \$21,182,990 and good will at \$20,517,985. Its total

assets were listed at \$263,363,179. Its property in Michigan was valued at \$133,025,079. Total capital and surplus were given as \$173,951,172 and the amount of capital and surplus \$87,861,284.

Liabilities include: Accounts payable \$28,724,701; accrued payrolls, \$2,827,546; income tax reserve, \$46,266,008; reserve for other taxes, \$2,167,600; reserves for employees' bonus, \$946,640; miscellaneous liabilities (estimated) \$8,484,487.

### Motor Excise Taxes Show Marked Decrease

WASHINGTON, Sept. 6—Tabulation of total collections of internal revenue from all sources for the fiscal year, 1921, show a decrease of \$28,377,631 in the excise tax on automobiles from the figure for 1920, when this form of taxation brought in \$143,922,792.

Carried out in detail, the payments of automobile excise taxes follow:

1920—Automobile trucks and automobile wagons.....	\$14,471,464.32
1921—Automobile trucks and automobile wagons.....	11,640,051.98
Decrease .....	\$2,831,412.34
1920—Other automobiles and motorcycles .....	\$76,315,814.26
1921—Other automobiles and motorcycles .....	64,388,105.80
Decrease .....	\$11,927,708.46
1920—Tires, parts, or accessories for automobiles.....	\$53,135,513.43
1921—Tires, parts, or accessories for automobiles.....	39,517,602.69
Decrease .....	\$13,617,910.83

### Production Steady at Indianapolis Plants

INDIANAPOLIS, IND., Sept. 8—In spite of the uncertainty of prices due to decreases by Ford, the Franklin and others during the past week, actual production in the Indianapolis plants is going forward as usual. No changes in production schedules has been made during the past week and the general opinion by some of the biggest men of the industry here is that so far as Indianapolis made cars are concerned the bottom has been reached. Demand continues steady.

The Marmon plant is working with a production of about fourteen cars a day. The Cole plant is having a steady production and officials believe there is a stronger trend in the demand. The H. C. S. plant schedule is holding to five cars a day, this being the amount fixed before the last price decrease. Officials of the Premier plant say that while their production is down, cars are being moved from the warehouse at a steady rate and it will not be long before the surplus will have been disposed of.

The big price slash by the Ford took the local Ford dealers by surprise as is customary in such events. None of them was expecting a cut at this time. The business had been good here and August sales were equal to July sales, which had been about the biggest in volume of the present year.

## General Motors Men Convene in Detroit

### Make Plans for Even Closer Working Arrangement—More Meetings Are Scheduled

NEW YORK, Sept. 6—Policies which will shape the future of General Motors Corp. were discussed at a joint meeting of the executive committee and the operations committee held in the new General Motors Building in Detroit.

Those present comprising the executive committee were Pierre S. duPont, chairman; J. Amory Haskell, J. J. Raskob and A. P. Sloan, Jr. The operations committee is headed by C. S. Mott. Representing the various General Motors companies were: H. H. Bassett, Buick Motor Co.; K. W. Zimmerschied, Chevrolet Motor Co.; H. H. Rice, Cadillac Motor Car Co.; A. B. C. Hardy, Olds Motor Works; G. H. Hannum, Oakland Motor Car Co.; W. L. Day, G. M. C. Truck Co.; J. A. Craig, Samson Tractor Co.; DeWitt Page, New Departure Mfg. Co.; Fred J. Fisher, Fisher Body Corp.; C. F. Kettering, Dayton Engineering Laboratories; R. S. McLaughlin, McLaughlin Motor Car Co. of Ontario; J. L. Pratt, accessory division; E. F. Johnson, inter-company parts division.

The meeting was practically in line with an important new policy which provides for an even closer working arrangement between the executive heads of the corporation and the constituent companies. The magnitude of the operations is indicated by the fact that General Motors now includes 78 subsidiary and affiliated companies.

It is regarded as significant that the most important conferences dealing with major affairs of the corporation apart from finance, are being transferred from New York to the center of productive activities in Detroit. In other words, men of large affairs who control the destinies of General Motors are getting closer to the firing line and in more direct contact with the actual making and selling of motor vehicles and allied products. Joint meetings of the executive and operations committees are now scheduled to take place at frequent intervals in Detroit.

A movement to bring about a greater co-ordination of the productive activities of the corporation was inaugurated soon after the duPont interests assumed a commanding position in General Motors affairs and the result of this common sense program has been reflected in lower costs, improved quality and increased production.

### NASH ORDERS HEAVY

KENOSHA, WIS., Sept. 6—The Nash Motors Co. in August had orders 50 per cent in excess of production. Both the Milwaukee and Kenosha plants are making every effort to catch up with the demand and indications point to an unusually busy fall.

## South Africa Talks on Trade Conditions

### Dealers Show Interest in New Duesenberg—Hupp Remains Industry Leader

JOHANNESBURG, Aug. 5 (*By Mail*)—The Council of the South African Motor Traders Assn. met at Durban this month in the City Hall for the transaction of business. Members from all parts of the country attended and the trade conditions formed the main topic of discussion. The S. A. M. T. A. has become an important body as regards the automobile trade of South Africa and its efforts to foster trade are being attended with considerable success.

Representations have been made to the Government from time to time dealing with the motor industry and the results obtained have amply justified the existence of the association. Almost every dealer of any importance in the country is now a member. The organizing secretary is making a comprehensive tour of all provinces of the Union in an endeavor to draw even small dealers in out of the way places into the association. Some of the tire companies held aloof from the organization at first but all have now joined.

Considerable interest has been aroused here by the latest Duesenberg "Straight Eight" performances in other countries and it is possible that models may be imported before long. The automotive engineers in South Africa are alive to the possibilities of the car and are exhaustively going into the proposition. High grade American cars are finding favor with a large section of the buying public as the prices of English cars are almost prohibitive. In view of recent price reductions in numbers of American models the English cars are not finding a ready sale.

#### Demand Light Cars

Price reductions are regarded rather dubiously by prospective buyers and for this reason sales have fallen off in some districts. The demand for serviceable, light cars still continues strong.

Guy G. Catlin, the Hupmobile representative, who is well known in this country, has returned to the States on business but announced that he hoped to return to South Africa before long. Catlin was instrumental in combining all the Hupp dealers into the firm known as Hupp Garages, Ltd. This organization has branches in all the important cities and towns in South Africa and holds the exclusive distributorship for the Union of South Africa.

The road problem is still under discussion as it is feared that the reduced subsidies given for this purpose by the Transvaal Provincial Council will be entirely inadequate to keep the roads of the province in anything like good order. Motoring bodies are strongly protesting against the reduction of the subsidy and

contend that roads must be kept in good order and that if economy is to be exercised it must not take the form of allowing the traffic arteries to deteriorate. In a country where the roads form an important means of feeding to the railway the factor of efficient transport is not to be lightly neglected.

#### Trucks Find Favor

Steam trucks are finding favor for country work and several English models are now being assembled for use in different parts. The South African railways use steam trucks and the results given are excellent.

The first petrol and oil service station has just been opened in Johannesburg. It stands in the heart of the motor center, and yet easily accessible for all the commercial centers of the town. It has been built on the regular American plan. It stands well back from the street, and has a paved roadway in front capable of accommodating many cars. This is an advance for the motor center. Many garages have petrol and oil pumps installed in front of their buildings, and also supply free air, but this is the first real petrol and oil service station to start operations in South Africa.

### Severin Oakland Factory Soon to Be Erected

OAKLAND, CAL., Sept. 6—Construction on the first building of the Severin Motor Co. factory in Oakland will start Sept. 15, according to an announcement made here by Maury L. Diggs, architect in charge of the building of the new plant. The first unit, according to Diggs, will be 60 x 450 feet. When completed, the plant will cover an area of four acres, and have a capacity of 20 cars a day. The company is moving to Oakland from Kansas City, where the factory has been making cars for three years. Equipment of the Kansas City factory is being packed, under direction of H. T. Severin, president of the company, and is expected to arrive here before the end of December. The company is capitalized for \$1,000,000.

### Action Taken Against Ford Owner Association

INDIANAPOLIS, IND., Sept. 6—Indiana Insurance Commissioner Thomas S. McMurray has notified the prosecuting attorney of Allen County to take immediate legal action against the Ford Car Owners Protective Assn., operating in Indiana out of Fort Wayne, for alleged violation of the State insurance laws.

McMurray took action against the organization after he had been advised by Attorney-General U. S. Lesh that the association is doing an insurance business in Indiana, although attempting to cover up the real purpose of its operations. State insurance departments of Michigan and Wisconsin are co-operating with McMurray in bringing action against the association.

## "Gas" Consumption Greater than 1920

### First Six Months Shows Increase of 259,313,353 Gallons in United States

NEW YORK, Sept. 6—The consumption of gasoline in the United States during the first half of the current year was larger by 259,313,353 gallons or a daily average of 710,447 gallons, than that of the corresponding period of 1920. Total consumption was 2,300,115,990 gallons compared with 2,142,705,363 gallons in the first six months of last year. Production was larger than the previous year by approximately 18 per cent, but in spite of the enormous demand prices of gasoline have declined in all sections of the country. The decline, however, is attributed solely to the lower cost of crude oil as it is contended that until recently there has been little or no reduction in the cost of refining, while transportation charges are at the same level as they were at the peak of 1920.

Reductions in gasoline prices on the average amount to 31 per cent, taking the leading cities of the United States as a whole. The average price at the close of August was 20.2 cents compared with 29.3 cents a gallon on Jan. 1 of this year. The drop, in all, amounts to 9.1 per cent. The largest declines since the beginning of the year have been at Dallas, Texas, and Denver, Colo., where they amounted to 13 cents a gallon in each city. The lowest wholesale price is 15 cents a gallon at Kansas City, Mo., while the highest is 25.5 cents in Boston.

### North Texas Business Shows Decided Gains

DALLAS, TEX., Sept. 6—The automobile business in Dallas and north Texas showed a decided improvement during the month of August, local retail dealers declare. This was especially true in the sales of modern priced cars. Truck dealers also reported improved business. The accessory men, the tire dealers and the garage men reported the past month has been the banner month of the year with them. Retailers of high priced cars reported that while sales have not materially increased with them they have held their own and that the outlook for the fall is exceedingly bright. Disposition of the grain crop at fairly good prices, moving of the cotton crop, reduction in prices of cars and employment of only salesmen who can and do deliver the goods are among the reasons assigned for the increased business in this section of the country.

#### ENGINEERS TO MAKE TOUR

MINNEAPOLIS, Sept. 6—The Minneapolis section of the Society of Automotive Engineers has decided to begin the year's program by a tour of inspection of the various automotive exhibits at the State fair this week.

## Hudson Car Is First in Peak Hill Climb

### Lexington Second in Annual Test —Eighteen Cars in Three Events

DENVER, COL., Sept. 5—Nearly 7000 people from 20 states saw King Rhiley in a Hudson win the Penrose trophy and a \$500 cash prize to-day in 19 min. 16 1/5 sec. in the main event of the Pike's Peak annual hill climb on a 12 2/5-mile course of the \$250,000 Pike's Peak automobile highway.

The second fastest time was 19 min. 47 4/5 sec., by Otto Loesch in a Lexington, trophy winner of last year, and to-day had first place in event No. 2 for 184 to 300 cu. in. piston displacement.

The third best time was 19 min. 51 1/5 sec., by Ralph Mulford's Paige, winning second place in the trophy event. The second place in event No. 2 was won by J. C. Williamson in an Allen, in 22 min. 49 3/5 sec.

Event No. 1 was for up to 183 cu. in., won by Glen Schultz in a Ford, in 21 min. 54 3/5 sec., with William Bentrup, a last year's winner, second to-day in 22 min. and 19 sec., driving a Chevrolet.

Course of 60 curves and grades 7 to 10 1/2 per cent starts six miles above the highway beginning, and ends 14,000 ft. altitude. The \$4,000 trophy was won first by Rea Lentz in a Romany Special, five years ago, while the course record of 18 min. 24 7/10 sec. was set by Mulford's Hudson that same year in the middle displacement class in a two-day meet. Mulford abandoned the race last year in a snowstorm. The weather conditions are ideal, with 18 cars starting in three events.

## Harper-Bean to Issue \$10,000,000 in Stock

LONDON, Aug. 25 (*By Mail*)—Directors of Harper Sons & Bean propose to issue three classes of debenture stock aggregating \$10,000,000 to meet claims of their various classes of creditors. Bankers will get \$1,500,000 of the stock; Lady Bean and her daughters an equal amount; Harper-Bean, Ltd., \$2,625,000, and unsecured creditors \$2,375,000.

Creditors with claims not in excess of \$125 will be paid in cash and creditors for larger sums will receive 16 cents per dollar of the amount due them.

A statement issued by the directors says that "no profits will be distributed among members of the company as long as money is due under the three trust deeds."

## International Books European Business

SPRINGFIELD, OHIO, Sept. 6—Foreign business is being booked by the Springfield works of the International Harvester Co., according to announce-

ment made by officials. The factory force is being increased slightly, although the demands for the light speed motor trucks have not increased sufficiently so far to warrant much of an addition. About 30 per cent of the regular force is being employed.

Within the past week the Springfield works have made a number of shipments to various points, to cities and rural sections of the country. Officials say they expect that the farmers will be in the market soon for trucks as they are now selling their grain. There is a better feeling among the people of the United States generally regarding the future, it is stated, and as a result there will be a gradual increase in business.

## Ballot Breaks Record in Italian Grand Prix

PARIS, Sept. 5 (*By Cable*)—Jules Goux in a Ballot broke the world's road record and established new records for cars of 183 cu. in. piston displacement in winning the Italian Grand Prix at Brescia, Sunday. His time for the distance of 324 miles was 3 hr. 35 min. and 9 sec.

Chassagne, in another Ballot, was second in 3 hr. 40 min. and 52 sec., and Wagner in a Fiat was third in 3 hr. 45 min. and 32 sec. Bordino in a Fiat broke the lap record with an average speed of 94 miles an hour, but was forced out when he had covered half the distance by a broken oil lead after being well in front from the beginning of the race. Sivocchi in a Fiat was forced out by a leaky tank and DePalma abandoned the race near the end.

## Westcott August Sales Set 1921 High Record

SPRINGFIELD, OHIO, Sept. 6—A high mark for 1921 was set in the sales of Westcott cars during the month of August, according to announcement made by the Westcott Motor Car Co. of this city. Although August normally is considered the second quietest month of the year, officials state that August business was higher than any month since June, 1920.

As a result of the constantly increasing business, the working force at the plant has been increased considerably recently. The force is now larger than at any time during the past year. The recent increase in employees, which practically doubled the force, is planned to take care of further production gains. Westcott officials say that they have noted an apparent improvement in general conditions in many sections of the country.

## GAS TAX RECOMMENDED

NEW ORLEANS, Sept. 6—Governor Parker has announced that he will recommend a sales tax of 1 cent a gal. on gasoline to the special session of the Louisiana Legislature which convened to-day. The constitution permits a 2 cent tax for road purposes.

## Georgia Business Shows Steady Gain

### First Seven Months of Year Indi- cate General Improvement for Fall

ATLANTA, GA., Sept. 6—A definite idea of automotive sales conditions in Atlanta and Georgia the first seven months of 1921 is given in a report issued the latter part of August by Charles Cook, cashier of the motor vehicle department in the office of the Secretary of State, covering the receipts of the department up to and including Aug. 15. Receipts are less by \$212,877.29 in 1921 than they were for the same period in 1920, and while the amount seems unusually large Atlanta dealers point to the fact that sales were very brisk during the early part of 1920.

The total amount received by the motor vehicle department up to Aug. 15, Mr. Cook reports, was \$1,692,308.09, while the total amount received to Aug. 15, 1920, was \$1,902,186.22. The total number of tags sold in 1921 to Aug. 15 was 119,500, and to the same date in 1920 was 137,129.

That the turning point for the better in the automotive industry in this section is at hand, however, is indicated by the fact that sales in the Atlanta territory during August have picked up to an appreciable extent. This is indicated not only by reports from various dealers, but the big increase in the issuance of license tags at the state capitol. For retail sales in Atlanta alone, not including any territory outside the city, the average has been about 50 per day, including new and used motor cars and trucks. A material increase also is noted in other sections of the state outside of Atlanta. Truck sales are gradually getting better, and more new passenger cars are being sold than for some months. A fair increase in used car sales also is noted, and the industry as a whole is experiencing such improvement that there is a more optimistic feeling among the dealers and distributors in Atlanta than they have known since last year. All are confident that the increase of the past two or three weeks portends the gradual return to normalcy.

## Cotton Has Climbed

Cotton has climbed in price about \$3 per bale at the present writing, a fact which means about \$20,000,000 to Southern producers on this year's crop alone. Governor M. B. Wellborn, of the Federal Reserve Bank of Atlanta, has given cause for further optimism in a statement in which he declares the bank is in stronger financial position than it was a year ago and will give substantial aid to Southern cotton for the orderly marketing of the crop. He declares that the general business and industrial outlook in the South is better than it has been since the armistice, and prophesies an early return to normal.

## Brazil in Market for American Cars

### Trucks and Tractors Also Could Be Marketed, Report There Shows

PORTO ALEGRE, BRAZIL, Aug. 15 (By Mail)—The opinion of automotive dealers here is that an opportunity exists for American cars, priced from \$2,000 to \$4,000, to sell in competition with European makes. They should be of the four or six-cylinder type, as it is said eight-cylinder machines would be difficult to sell here now, although there are one or two makes of eights that should prove satisfactory here. The makes offered should have magneto ignition and sturdy wheel and spring construction, as road conditions are irregular.

Trucks from one to two tons could be successfully marketed here, although the present number is few. Ford trucks, of course, lead the makes now here, although there are some German Durkops and Mulags, a few Fiats of various sizes and several Renaults. As to tractors, the opinion is that the smaller sizes are the more suitable. Two heavy European tractors recently failed in a test here, while one of the smaller American makes went through the demonstration with flying colors.

Prior to the war Porto Alegre, with a population of 200,000, had only 242 cars, mostly of European make, only two American lines being known. During the war, however, Ford, Studebaker, Nash and Chandler were successfully introduced and later Packard, Dodge, Cole, Elgin, Velie, Chalmers, Jordan, Essex and Hudson had no difficulty in getting into the market. At the beginning of last year there were registered here and in actual use 850 cars.

The small number of cars handled here is a surprise and it is the opinion that opportunity exists for other good makes.

## Farm Machinery Has Good Sale in Spain

WASHINGTON, Sept. 6—Unprecedented sale in Spain of American agricultural machinery to meet with requirements of the present harvest is reported. Evidences of a bumper crop, impelling the purchases, are to be observed on every side on a tour extending from Madrid to Barcelona.

Farmers and dealers in Zaragoza and Pamplona are all declared patrons of American Agricultural machinery, especially reapers and binders. There is also a good market offering for some sort of light threshing machine, possibly operated by horse power; a number of farmers have expressed a desire to obtain such a machine, buying and using it on a co-operative basis.

The large separator is somewhat too expensive and the output too great to

meet with general acceptance. The universal method of threshing is by means of a flail and tramping out by oxen.

The grain is tramped on the hard ground. It is then separated from the chaff by a process of throwing high in air and trusting to the wind to blow away the chaff.

Commercial Attaché Cunningham, in a report from Madrid made public by the Bureau of Foreign and Domestic Commerce, expresses enthusiasm over the prospect of this market.

## Plan to Merge Detroit Engineering Societies

DETROIT, Sept. 6—A plan to organize all of the engineering societies of Detroit into one group has been formulated by the Associated Technical Society. A number of preliminary meetings have been held and another will be called on Sept. 16 at the Board of Commerce. The purpose of the organization is to combine the clerical work into one organization, thus effecting a much needed economy, and, furthermore, it is purposed to so arrange the meetings of the various societies that while they are of particular interest to one group, they may be of general interest to the entire group or a large percentage of it.

Similar organizations have done very effective work in other cities. The Buffalo Engineering Society, of which the Buffalo Section of the S. A. E. is a member, is a very good instance. The Detroit Section of the S. A. E. has been approached on this new organization and Chairman Coffin of the local organization stated to-day that he is in favor of it.

## Charles J. Glidden Now Heads Martin Motor

SPRINGFIELD, MASS., Sept. 6—Charles J. Glidden, well known in the automobile world as the donor of the Glidden trophy and the originator of the Glidden tours, has re-entered commercial life as president of the Martin Motor Co., Springfield, Mass. This is a recently organized company which will manufacture a small three-wheel car designed by Charles H. Martin of the Martin Rocking Fifth Wheel Co. This small car weighs a little over 200 lbs. and will sell for approximately \$500.

## HARLEY-DAVIDSON WINS

NORTHBAY SPEEDWAY, COTATI, CAL., Sept. 6—Otto Walker, piloting a Harley-Davidson motorcycle, finished first in the 25-mile open professional race in the big bowl here Aug. 28, thereby setting a new national record for the distance of 16. min. 29 sec. This track is a mile and a quarter, so that there were 20 laps to the race, Walker maintaining a speed of 42 sec. to the lap, or 106 miles an hour. This record is faster than the record for the board track at Los Angeles, hitherto credited with being the fastest track in the country.

## Shipping by Truck Affects Railroads

### New England Roads Hit by Increase in General Commercial Work

PUTNAM, CONN., Sept. 5.—Operation of scores of motor trucks, engaged in general commercial work on either long or short hauls, through this section of New England, is eating into railroad freight business to such an extent as to attract attention of higher rail transportation officials, who have directed that an inquiry be conducted, with a view of bringing about remedial action. Railroad freight experts have been in this territory during the past week to interview shippers as to why the railroads cannot regain some of the business that they have lost.

Some of the shippers have been especially frank with the railroad men and have pointed out to them that the high freight rates and, oftentimes slow service, have resulted in much business being diverted to the truck service. This is especially true in regard to the handling of raw and finished material for the many manufacturing plants in this section and many of the mercantile houses.

Trucks are used not only between this territory and Boston, Providence and New York, but on shorter hauls to steamer termini at Norwich, New London and Stonington. Many of the mills and mercantile houses own and operate their own fleets of trucks, while many firms are engaged in the truck business by contract. Steamship lines, with a view of getting the patronage of small shippers and others without truck service, have inaugurated a truck service of their own, from their docks into the surrounding territory for a 50 or 100-mile radius.

### Much Freight Delay

In their conference with railroad representatives, shippers of this territory have cited numerous instances of freight delay that they claim are characteristic of general conditions. Shipments from Worcester, Mass., to within five miles of Putnam and only 30 miles from Worcester, in a direct line, have often, shippers say, been upward of a week in getting through. The same is more or less true, they claim, relative to shipments from Providence and other points into this territory. They point out that the trucks have proved dependable and have furnished a fast delivery service. The manner in which they have eaten into the so-called "local" business of the railroad lines, especially the New York, New Haven & Hartford Railroad, is little realized, it is stated, excepting by the railroad men. It is freely admitted by freight officials that the New Haven road, and probably the others, will seek means of speeding up their local freight services in an attempt to not only compete with the trucks but to regain some of the business they have lost.

## Many Will Attend Tire Convention

**Dealers Prepare for Three-Day  
Meeting at Cleveland, Oct.  
18, 19 and 20**

CLEVELAND, Sept. 6—Invitations for the National Tire Dealers Assn. convention have been mailed to more than 5000 dealers throughout the United States. The convention is to be held at Hotel Winton, this city, on Oct. 18, 19 and 20. At the headquarters of the association in this city, plans are being made to entertain 1000 delegates. This will be the first convention of the organization, and the assemblage will be the first one of strictly tire dealers ever held. The Cleveland branch is in charge of arrangements, and R. F. Valentine, of this city, is chairman of the committee on arrangements.

### A Complete Program

A program in which nothing has been left undone that would affect the comfort or pleasure of the delegates and visitors in any way has been arranged. From the minute they arrive in this city until they leave, their time has been taken care of on the schedule. Delegates are urged to plan their visit so that business sessions may start on time.

The Central Passenger Assn. has approved the application of the tire dealers' association for reduced fares, and a special rate of fare and a half for the round trip has been granted. The instructions for obtaining the reduced rate provide that a one-way tariff fare at the full rate be purchased on any of the following dates: Oct. 14, 15, 16, 17, 18, 19 or 20. When purchasing the ticket, the delegate must ask for a certificate. This certificate will be validated when the return ticket is purchased, and the fare will be one-half of the regular rate for the return journey.

### Oct. 18 the First Day

The program has been outlined as follows:

**Tuesday, Oct. 18:** 8.30 a. m. to 10 a. m., registration and assignment; 10 a. m. to 12 noon: Morning sessions—attendance recorded; reading of minutes of formative session held in Chicago, Jan. 30 to Feb. 2, 1921; report of president; report of board of directors; appointment of these committees, finance committee, nominating committee, auditing committee and resolutions committee. 12 noon to 2 p. m.: Luncheon; 2 p. m. to 4.30 p. m., report of secretary; report of treasurer; discussion of finances; recess.

**Tuesday evening:** Special demonstration of tire accessories and devices the dealer can employ in his business. The tire and accessory show will be open until 11 p. m.

**Wednesday, Oct. 19:** The entire day will be spent in Akron in inspecting the world's largest tire producing plants. It is planned also to send a delegation to Kent to inspect the only fabric mill in the Akron section. These two features will consume the entire second day and will prove very interesting and instructive to every delegate and visitor attending the convention.

### M. A. M. A. MESSAGE OF GOOD CHEER IS SENT BROADCAST BY 400 COMPANIES

NEW YORK, Sept. 6—This message of good cheer is being sent broadcast by the Motor and Accessory Manufacturers Assn. through its 400 affiliated companies, on stationery, advertising and catalogs:

### HAVE FAITH IN YOUR INDUSTRY!

The facts justify it—  
Courage compels it—  
Progress assures it—  
Destiny proclaims it—  
Business requires it—  
The World needs it—

### Civilization will not go into reverse THE AUTOMOBILE INDUSTRY MUST GO FORWARD!

This slogan expresses the spirit and plan of the credit convention which the association will hold at the Hotel Statler, Detroit, next week.

In addition to the topics relating to finance and credit, there will be a symposium by sales and advertising executives on the subject "Selling Strategy to Bring the Automotive Industry Back to Normal."

In line with the association's message of unswerving confidence, several speakers will discuss the topic, "Why I Have Faith in the Automotive Industry."

**Wednesday evening:** The Cleveland branch of the National Association has arranged a program of stunts. The evening entertainment will be held in the Rainbow room of the Hotel Winton, and, although it will be considered part of the sessions, it is not compulsory that the delegates attend this event.

**Thursday, Oct. 20:** 9.30 to 12 noon, reports of committees; reports of special committees, unfinished business; 12 to 2 p. m.: luncheon; 2 p. m. to 4.30 p. m., new business; election of officers; discussion of topics.

**Thursday evening:** This will be the "night of nights" so far as the convention is concerned. A banquet and musical program has been planned. There also will be entertainment by professionals. Two speakers of national reputation, yet to be chosen, will talk.

A special ladies' committee from the Cleveland association will entertain visiting ladies on sight-seeing trips, matinee parties and concerts.

The tire and accessory show which will be held in connection with the convention promises to exceed the expectations of those in charge. Applications for space have been coming in rapidly. Tires of all makes will be on exhibition.

The board of directors of the National Tire Dealers Assn. will meet in Cleveland Oct. 17, at the office of the association, to consider appointments for various committees and to outline business details that are to be brought to the attention of the delegates.

## Reports of August Sales Satisfactory

**N. A. C. C. Directors Well Satisfied—Price Cuts May Slow Up  
September**

NEW YORK, Sept. 8—Directors of the National Automobile Chamber of Commerce are meeting here to-day after the close of the vacation period. While they have no illusions concerning the future they are well satisfied with the condition of the automotive industry. They realize that they are in much better position than manufacturers in almost any other line. There is a strong feeling that whatever price adjustments are in prospect should be made immediately so that business can be stabilized for the fall. It is pointed out, however, that purchasers are getting the benefit of price reductions and that this is true of practically no other commodity.

Reports from 20 distribution centers show that retail business for August was on a par with July except for two agricultural districts. This is considered a very gratifying showing. The reports indicate that the frequent price changes in the last 10 days will have an adverse effect upon September sales but it is believed that if there are no other changes business will be stabilized and there will be a satisfactory volume of trade. After this month sales are expected to taper off gradually until the show period although there is in prospect an unusual demand for enclosed cars.

Reports from manufacturers of car shipments for August show that they were virtually the same as in July.

Application blanks and diagrams for the New York and Chicago shows have been sent out. All applications for space to be considered in the first space allotment must be received not later than noon of Oct. 1. Drawings for space in the automobile sections will be held at the N. A. C. C. headquarters here Oct. 6. Drawings by applicants who are not members of the N. A. C. C. will take place as soon thereafter as possible.

## Stockholders Agree on Fisk-Federal Merger

SPRINGFIELD, MASS., Sept. 8—Stockholders of the Fisk Rubber Co. and the Federal Rubber Co. have voted to accept the proposal of the directors for a consolidation of the two companies with the Ninigret Co. The consolidation will take the name of the Fisk Rubber Co.

The company will issue \$10,000,000 in first closed mortgage, 20 year 8 per cent sinking fund, gold bonds at 99 with interest to yield 8.10 per cent. The bonds are uncalled until Sept. 1, 1931. During the life of the bonds, control of the company through the right to elect two-thirds of the directors, will be vested in a group of business men.

# Price Stabilization Is Not Yet Here

## Another Reduction Epidemic Under Way

Several Lines Cut Third Time—  
Labor Lower—Material Costs  
Down

NEW YORK, Sept. 7—Price stabilization apparently has not been reached in the automotive industry. Another epidemic of reductions on passenger cars and trucks is sweeping over the factories. In the case of virtually every passenger car the cuts are the second in three months, and in many cases they are the third. There have been fewer reductions in the truck field, and the cuts have been less drastic, but with the stimulation in business which is becoming apparent here and there, especially in the demand for the lighter models, it is quite possible further reductions will be made.

Predictions as to whether there will be a fourth cut in passenger car models are unsafe, judging from the experience of the last three months. Manufacturers seem to be finding it possible to effect factory economies, chiefly by lower labor costs, and consumers are getting the benefit of these economies. Another factor tending towards lower car prices has been the gradually lessening cost of raw materials and parts.

The effect of the latest cuts on sales at retail is not yet altogether clear. Reports are filtering in from some distribution centers that prospective buyers are beginning to hold off on the theory that additional reductions are imminent. On the other hand, manufacturers report that the cuts have stimulated business.

It is generally agreed, however, that a maximum of retail sales cannot be reached until there is something approaching stabilization of prices.

## Sandusky Tractors to Sell for \$425 and \$500

NEW YORK, Sept. 6—The Cameron Motors Corp., which recently acquired the Sandusky Tractor Works, has issued some particulars of the new Sandusky tractor which it will manufacture. The machine will have a unit power plant with short axles set into the sides of the flywheel housing on which the driving wheels are mounted on flexible roller bearings. In addition to these driving wheels there are two small trailer wheels at the rear.

The engine is a four cylinder air-cooled Cameron, developing 10 hp. at 1000 r.p.m., the cylinder dimensions being 3 by 4½ in. Two forward speeds and a reverse are obtained by the enclosed spur gear transmission. There is a power

take-off pulley at the rear on an extension of the engine shaft. The power from the engine is transmitted through spur gears to a countershaft, then through bevel gears to a transverse shaft and finally through spur gears to the driving wheels. The weight of the machine is given as 1000 lbs. It is made in two models, a walking model and the riding model, the prices being \$425 and \$500, respectively.

## Willys-Knight and Overland Cars Cut

TOLEDO, Sept. 6—Another price reduction has been made by the Willys-Overland Co. on the prices of all models of Willys-Knight and Overland cars. It is stated that the reduction was made possible partly through manufacturing economies which have been in process of installation in the plants for the past year and a half and partly through lower costs of raw materials.

The Overland prices follow:

	New Price	Old Price
Touring .....	\$595	\$ 695
Coupe .....	850	1000
Sedan .....	895	1275

Willys-Knight prices are:

Touring .....	\$1525	\$1895
Coupe .....	2195	2550
Sedan .....	2395	2750

The present model of Overland touring car was first offered to the public in 1919 for \$845. The price later was raised to \$1,035, but it was cut to \$695 in June.

The Willys-Knight touring car sold for \$2,300 last year and the present reduction makes a total cut of 34 per cent.

## NEW FRANKLIN PRICES

SYRACUSE, N. Y., Sept. 6—The H. H. Franklin Mfg. Co. announce the following price cuts:

	Old Price	New Price
Sedan .....	\$3,650	\$3,350
Touring .....	2,650	2,350
Brougham .....	3,550	3,250
Roadster .....	2,550	2,300

## INDIANA TRUCKS REDUCED

MARION, IND., Sept. 6—Reduction of \$705 on the 1½-ton and reductions from \$115 to \$450 on all other sizes of Indiana trucks were announced here to-day by the Indiana Truck Corp. The price cut brings the 1½-ton truck to \$1,745 list. No change in specifications has been made.

## CANADIAN FORD DOWN

DETROIT, Sept. 7—The Ford Motor Co. of Canada, Ltd., has announced new prices on all models. The touring car hereafter will sell for \$565, the roadster for \$515, the chassis for \$470, the coupe for \$890, and the sedan for \$990. The truck chassis will sell for \$615. Starting and lighting equipment will cost \$85.

## Ford Prices Are Cut Third Time in Year

Roadster Now Selling for \$325—  
Production Beats All High  
Records

DETROIT, Sept. 2—The third reduction in Ford prices in the past 12 months now places the Ford at the lowest price in its history, being under the prices for which it sold before the war. Reductions are made on all models of the passenger car, on the chassis and on the truck, but the price of the tractor remains unchanged. The reductions range from \$45 to \$100 as follows:

	Old Price	New Price	Reduction
Chassis .....	\$345	\$295	\$ 50
Touring car* ..	415	355	60
Roadster* .....	370	325	45
Coupe .....	695	595	100
Sedan .....	760	660	100
1-ton truck ..	495	445	50

\* Price without starter and demountable rims.

In making the announcement, the company states:

"We are taking advantage of every known economy in the manufacture of our products in order that we may give them to the public at the lowest possible price and by doing that we feel that we are doing one big thing that will help this country into more prosperous times. People are interested in prices and are buying when prices are right."

The production of Ford cars and trucks for August again broke all previous high records with the total reaching 117,696. This is the fourth consecutive month in which the output has gone over the hundred thousand mark. The total for the four months being 463,774, which has gone a long way in making possible the present reductions. June of this year with an output of 117,247 was the previous record month.

## CHEVROLET HAS NEW CUT

NEW YORK, Sept. 6—The Chevrolet Motor Co. has announced the following price cuts for the 490 model, fully equipped, effective Sept. 3: Touring car, \$525; roadster, \$525; coupe, \$875; sedan, \$875. This is a reduction of \$100. It is the third reduction on the model since June, when the price was \$1,185.

Changes in specifications have been made. The model has undergone construction changes whereby the rear axle used with spiral bevel ring gear and pinion and hand controlled emergency brake lever. Timken roller bearings are substituted in the front wheels. A new assembly method has been introduced, securing positive alignment of transmission.

(Other price cuts on page 497)

# Kansas City Fall Outlook Is Brighter

## Marked Increases Noted for August

### Conditions Generally Improved in Rural Sections Due to Favor- able Crops

KANSAS CITY, MO., Sept. 6.—During August a marked improvement in business was reported from the smaller towns of the Kansas City district, directly reflecting the movement of crop money. This movement is reaching the larger centers in the shape of orders to wholesalers in many lines. The improvement in general conditions in the outlying territory is being shown in an increased movement of motor cars from dealers' hands; and from distributors' hands to dealers.

#### Crop Starts Business

This new factor is a very great relief to the Kansas City distributors for the retail trade in the city has declined in the past six weeks. Whereas other lines of merchandise at wholesale have maintained good volume throughout nearly the whole year in Kansas City, it seems fairly sure that trends are changing, and that the motor car distributor will have proportionately nearer his share, this fall. This was indicated in the results of a "market week," held Aug. 29-Sept. 3 by the Kansas City dry goods, shoe and clothing houses. There was a small attendance of merchants and while visitors bought fairly heavily of dry goods staples on which prices are rising, they did not buy hardware or clothing, on which prices are uncertain.

The reluctance of the merchants to buy—clothing, for example—was due partly to their own uncertainty as to the future course of prices but even more, to the uncertainty of their own retail demand. Many of these merchants say that farmers are buying this fall only for their children and the cheapest apparel. They are postponing other purchases, and may go through the winter with practically none of their usual demand.

#### Prices Fail to Enthuse

The price matter is a dominant one in fixing the farmer's purchasing program. Agitation of this question continues in the motor field. And the motor car price fluctuations are having influence far beyond that industry. Whereas a price reduction a few months ago would result in quickened sales a price reduction now has comparatively little effect in stimulating sales. The public seemingly concludes, when a price cut is made now, that perhaps another cut

will be made in another month or so—or that some other car perhaps more desirable, will be cheaper a little later. This is the effect in the motor field.

The motor car price cuts disturb the whole buying practice of the public, however. When the cuts were announced Sept. 1, many comments were heard in numerous industries and by citizens regarding a great variety of commodities that evidently prices were coming down on everything.

Effort to sell motor cars has resulted in many a firm loading up with used cars to the point where the bank is at any time likely to demand liquidation. The larger firms and those with sound reputation with bankers and public, have been conducting business conservatively, preferring to forego sales where long trades were demanded or where credit was not first class. They have had small volume but they have preserved their credit intact and will enter the fall and winter season fully able to withstand any depression. Some of the smaller firms and those which have sought immediate volume, are in hard straits.

The banks have plenty of money but they naturally are not going to risk it unduly. The declining prices of motor cars is a factor in the bankers' hesitancy to take on motor car credits or grant extensions.

(Continued on page 497)

## Weeks Asks Ford Again to Confer on Offer

WASHINGTON, Sept. 7.—Secretary of War Weeks has sent a letter to Henry Ford suggesting a conference to discuss Ford's offer to take over the Government's nitrate and power plant at Muscle Shoals, Ala. As the Ford offer stands at present, Weeks said, it is not satisfactory but it is quite possible the proposal may be so modified that it will be satisfactory to the Government and Ford. If the automobile manufacturer can meet Weeks' suggestions, he can have the United States plant so far as the recommendation of the Secretary of War has weight with Congress.

#### BUS PURCHASE DELAYED

DETROIT, Sept. 7.—Purchase by the city of trolley buses, such as demonstrated by Packard, has been laid over until after the October election to permit an amendment to the charter. The present charter will only permit the railway commission to purchase the regular type trolley car. An amendment to provide for the purchase of gasoline buses or other types of trackless trolleys will be substituted. A three-fifths vote will be necessary to pass the amendment.

## Receiver Appointed for American Motors

### Action Follows Equity Suit Filed by Attorneys for 80% of Creditors

NEWARK, N. J., Sept. 7.—Federal Judge Lynch has appointed receivers for the American Motors Corp. of Plainfield in an equity suit filed by attorneys representing 80 per cent of the creditors of the company. The action is understood to have been taken with the consent of the company and is said to be equally for the protection of the creditors and the stockholders. The nominal assets are listed at \$3,500,000 and the liabilities at \$600,000. The company is a Virginia corporation with a paid up capital of \$1,260,000.

The receivers appointed were Proctor W. Hansel, first vice-president and treasurer of the company, Plainfield, and James Kearney of Trenton. They were authorized to carry on the business for 30 days. The Fisk Rubber Co., with unpaid bills aggregating \$29,257, is the largest creditor.

The American Motors Corp. was incorporated in 1916 to manufacture the "American Balanced Six." Production was begun in the early part of 1917. The 1919 dividend on the preferred stock was paid April 15, 1920. The general balance sheet as of Jan. 1, 1921, fixes the value of the plant and equipment at \$272,907 and the inventory at \$433,865. Cash amounted to \$152,396 and notes and accounts receivable to \$91,493. Good will was valued at \$1,558,272. The notes and accounts payable amounted to \$357,571. There is a mortgage for \$55,000.

The directors of the company are Robert Bursner and R. D. Mock of Cleveland; P. W. Hansel, Guy Morgan, E. G. Hines and George G. Gates of New York; C. B. Penny and William Newcorn of Plainfield, and R. J. Mebane of Greensboro, N. C.

Affiliated with the corporation is the American-Southern Motors Corp., incorporated in North Carolina in 1919 to assemble the American Balanced Six for distribution exclusively in 12 Southern States. The subsidiary company merely assembles the car which is manufactured at Plainfield. The plant is located in Greensboro, N. C.

#### WANT TIRE STANDARDS

NEW YORK, Sept. 7.—The Rubber Association of America has appointed a special committee to investigate the possibilities of formulating and adopting a table of tire standards for use on tractor wheels. A report is expected in the near future.

## Credit Convention Program Is Timely

### Bringing Business Back to Normal Big Theme of M. A. M. A. Detroit Meeting

NEW YORK, Sept. 7—The program for the fifth annual credit convention of the Motor and Accessory Mfrs. Assn., which will be held at Detroit next Wednesday, Thursday and Friday, has been practically completed. The keynote of the convention will be "Bringing the Automotive Industry Back to Normal." All the addresses and discussions will be along this line and the subject will be considered from the viewpoint of all branches of the industry. The tentative program follows:

#### FIRST DAY

##### (Morning)

The President's Address—by E. H. Broadwell, vice-president, Fisk Rubber Co., Chicopee Falls, Mass.

General Address on Association's Activities (including group plan of inter-organization)—by M. L. Heminway, general manager, Motor and Accessory Mfrs. Assn.

The Association's Credit Department as the Safety Valve of the Industry—by C. A. Burrell, manager credit department, Motor and Accessory Mfrs. Assn.

How the Association's Traffic Department Delivers the Goods—by Herman Deuster, manager traffic dept., Motor and Accessory Mfrs. Assn.

##### (Afternoon)

General Keynote: Business Conditions in the Automotive Industry and Prospects for the Future.

From the standpoint of the Raw Material Producer—by J. M. McComb, vice-president, Crucible Steel Co., Pittsburgh, Pa.

From the standpoint of the Parts Makers—by M. A. Moynihan, secretary and treasurer, Gemmer Mfg. Co., Detroit, Mich.

From the standpoint of the Banker—by J. P. Harris, vice-president Union Trust Co., Cleveland, Ohio.

From the standpoint of the Car Manufacturer—by a prominent manufacturer.

From the standpoint of Selling Automobiles to the Consumer Market—by Harry G. Moock, general manager National Automobile Dealers Assn.

General Open Discussion from the Credit Standpoint.

#### Discussion Leaders

L. L. Smith, credit manager, B. F. Goodrich Rubber Co., New York.

Charles Burr, treasurer, S. K. F. Industries.

O. K. Schnaitter, assistant secretary and treasurer, Willard Storage Battery Co., Cleveland, Ohio.

Thomas M. Simpson, credit manager, Continental Motors Corp., Detroit, Mich.

E. R. Ailes, treasurer, Detroit Steel Products Co., Detroit, Mich.

#### SECOND DAY

##### (Morning)

The Work of the Credit Grading Committee—by Geo. J. Johnstone, credit department, Armour & Co., Chicago, Ill.

Credit Policies Under Present Conditions—by C. W. Dickerson, vice-president, Timken-Detroit Axle Co., Detroit, Mich.

The Personal Equation in Granting Credit—by A. H. D. Altree, vice-president, American Bosch Magneto Corp., Springfield, Mass.

Why I Have Faith in the Automotive Industry.

##### (Afternoon)

Getting the Most From the Credit Interchange Groups—by C. S. Davis, secretary and treasurer, Warner Gear Co., Muncie, Ind.

Selling Strategy to Bring the Automotive Industry Back to Normal—(A symposium)—led by W. O. Rutherford, vice-president, B. F. Goodrich Rubber Co., Akron, Ohio.

Walter Coghlan, general sales manager, American Hammered Piston Ring Co., Baltimore, Md.

E. W. Clark, advertising manager, Clark Equipment Co., Buchanan, Mich.

William H. Huff, advertising manager, Distel Wheel Corp., Detroit, Mich.

F. S. Armstrong, sales manager, Vesta Storage Battery Co., Chicago, Ill.

Frank N. Sima, assistant sales manager, Timken-Detroit Axle Co.

General Open Forum on Business Conditions and Association's Activities—Group Plan—G. Brewer, manager, Automotive Equipment Dept., Westinghouse Electric & Mfg. Co., Springfield, Mass.

H. R. McMahon, Standard Steel Spring Co., Coraopolis, Pa.

H. P. Carrow, Hayes Mfg. Co., Detroit, Mich.

#### LONG RACE IS PLANNED

NEW YORK, Sept. 7—A transcontinental automobile race across South America, from Santiago, Chile, to Buenos Aires, Argentina, is planned to be held on Feb. 1, 1922, according to advices received here from those countries. This international touring route was recently opened by a pathfinding party of the Argentine Automobile Club, taking in the cities of Bahia Blanca, Neuquen, Curacautin, Chillian and Talca, a total of 2630 kilometers.

The race will be held under the auspices of the newspapers *El Mercurio*, of Santiago, and *La Nacion*, of the Argentine capital, and a prize of 20,000 pesos will go to the winner. The competition will be open to all cars of both European and American makes, and it is to be expected that a large number will take part.

The charting of the international route which took place early this year is reported to have given a strong impetus to touring and to road races.

## Insurance Company Accepts N.A.C.C. Ideas

### National Liberty Agrees "Moral Hazard" Has Much to Do With Big Losses

NEW YORK, Sept. 7—The contention of the National Automobile Chamber of Commerce that the heavy losses of insurance companies on automobiles with the consequent necessity for imposing high rates has been due largely to lack of consideration for the "moral hazard," has been accepted by the National Liberty Insurance Co., which has ordered a clean up of its automobile business.

#### Character Overlooked

A statement by the company says that "many policies have been issued without reference to the character and standing of the assured and without adequate knowledge of the risks assumed" and that "many policies as now written are invitations to the unscrupulous to perpetuate frauds upon the insurance companies."

These statements are contained in a letter sent to agents announcing that commissions payable hereafter will be uniformly 15 per cent with a contingent of 15 per cent subject to certain conditions.

#### Readjustment Planned

"Many automobile policies issued by this company, now enforced, are for amounts in excess of present market values," says the letter. "Should total loss occur, the assured should not expect to receive more than the replacement value of the car, which in many cases will be several hundred dollars less than the insurance carried. A readjustment will be made of such policies reducing the amounts of insurance to approximately the present market value."

## English Bean Model Appears in Japan

SEATTLE, Sept. 5—The latest newcomer to the light car ranks on the Japanese market is the Bean, an English product, with a small four-cylinder motor, and a R. A. C. rating of 11.9 horsepower. The Japanese rating is 9.92 horsepower, so that the Bean just manages to come into the 5 to 10 horsepower tax valuation, and for this reason it has a very strong talking point in view of the prohibitive taxes being imposed on automobiles of greater horsepower in Japan.

The Bean is of the conventional British light car design, but is produced in rather larger quantities than other British light cars. The British bodies include a four-passenger touring, a two-passenger roadster and a coupé, and it is believed that the Japanese agents will also supply closed bodies of Japanese manufacture for the chassis.

## Hares Motors May Have Its Own Line

### Engineers Have Plans Completed for Full Line of Passenger Cars and Trucks

NEW YORK, Sept. 7—Dissolution of the contract with the Locomobile Co. held by Hares Motors will have no effect on the future of the latter corporation. Hares Motors will continue to handle sales for the Kelly-Springfield Motor Truck Co., and it is understood negotiations are pending for taking over the sales of one or more established passenger car lines.

If Hares Motors does not enter into contracts similar to those it held with the Mercer and Locomobile companies, it intends to revert to its original plan of developing a complete line of passenger cars and trucks. The engineering department of the company has worked out detailed plans for a complete line of both classes of vehicles. This would include passenger cars in three price classes and trucks of various capacities. The Hares Motors organization remains intact and no changes are contemplated.

No successor has been appointed as yet to A. K. Stewart, who has resigned as general manager of the Kelly-Springfield Truck Co. and returned to New York. Stewart took charge of the factory Feb. 1. The Kelly-Springfield plant is being operated on about the same basis as for the past few months, but the outlook for business is understood to be gradually improving.

## Kansas City Outlook Brighter for Fall

(Continued from page 495)

The opening of the fall term of the county circuit court is revealing many suits on motor car transactions—suits by securities companies, by sellers of cars, by distributors of accessories, and by banks. There is also a quickened current of bankruptcies in the federal court, in which motor equipment figures. It seems that nearly every bankrupt owes money on a motor car.

Nearly every bankrupt owes money to a bank—which will result in an increased tendency on the part of bankers to watch their accounts closely and require good moral or other security from borrowers, the securities being accepted at mighty low valuations.

E. F. Fader, director of the United States Employment Service in the Fourth district is unable to see any hope for relief for unemployment in any concerted action by business men, except as directed towards road building. He has suggested that cities, counties, states and the government should undertake highway construction programs at once so that before Oct. 1 in every community, there will be common labor available for every man who is out of work.

Fader suggests that instead of con-

tracts being let for road building, the counties themselves do the work, hiring the men—and hiring them frankly and definitely as an eleemosynary project, to provide them with money honestly earned. Because of the great amount of unemployment it is inevitable that wages will decline for common labor and even for many classes of labor.

An obstacle to the undertaking of road-building programs, is the difficulty of selling road bonds profitably but this is a phase which financiers, it is suggested, ought to be able to overcome as perhaps less expensive and objectionable in the long run than the conditions that will accompany widespread unemployment in the winter period.

The net conclusion from a survey of the entire field is:

That general merchandising will be fairly good in the smaller towns, merchants buying from hand to mouth.

That motor trade will be fair in small towns.

That city merchants and city motor car retailing will be light.

That there will be an army of unemployed.

That if road construction is promptly undertaken on a big scale rural business will be greatly increased and city wholesalers will reach a normal volume, city retailers profiting by the better condition of the territory.

That motor car dealers who have not sailed close to shore will be in trouble whatever happens.

## Reductions in Cars and Trucks Continue

(Continued from page 494)

### STUDEBAKER CUTS AGAIN

SOUTH BEND, IND., Sept. 8—Another reduction in prices of the "Light Six" Studebaker cars is announced by President Erskine. He attributed the cut to lower manufacturing costs resulting from larger production. The prices follow:

	New Price	Old Price
Roadster .....	\$1,125	\$1,300
Touring .....	1,150	1,335
Coupe .....	1,550	1,695
Sedan .....	1,850	1,995

Last December the price of the touring car was \$1,485 and the sedan \$2,450. The Studebaker plants are operating at capacity and production is larger than ever before.

### DEFIANCE TRUCKS CUT

DEFIANCE, OHIO, Sept. 7—The Defiance Truck Co. has announced price reductions ranging from \$200 to \$375. The 1-ton model now will sell for \$1,695 and the 2-ton for \$2,275.

### CHEVROLET TRUCK CUT

DETROIT, Sept. 7—Price cuts have been made in Chevrolet Model T 1-ton truck and Model G  $\frac{3}{4}$ -ton, the former from \$1,225 to \$1,125 and the latter from \$820 to \$745.

## Industry Has 3.06% Drop in Employment

### August Report Shows 5,520 Less Workers Than on July 31— Trade Recovering

WASHINGTON, Sept. 6—Survey of industrial conditions by the United States Employment Service shows that business is slowly recovering from the depression and that the future will widen employment of a healthy and lasting character. However, among the industries reporting a decrease in employment in August was the automotive trade, which showed a decline of 3.06 per cent or 5520 less employees on the payroll than on July 31.

These figures are based upon returns from firms usually employing 501 or more, located in 65 industrial centers but they do not cover the smaller establishments, which are by far more numerous and employ less than 500.

A survey of manufacturing regions shows that the automobile trade in Michigan is recovering rapidly. It is stated that the rapidly exhausting stocks give promise of an early resumption of manufacture. This is the most helpful sign in the situation. A trying winter, with considerable unemployment, is anticipated. The employment service has noted that larger manufacturers of low priced automobiles are operating at full capacity but with considerably fewer men than they had in January and February, 1920. Certain departments of automobile factories in Flint are reported as running overtime, and this situation lends encouragement to local business men.

In Wisconsin, automobiles and rubber tires show increased activity, while agricultural implements are dull. The State has undertaken a large road construction project involving the building of 2400 miles of concrete and gravel highways. Price cuts have increased as have many local motor companies.

The belief exists that the movement of crops to market during this month will result in increased sales of all commodities. Until the crops are harvested, there is little ground to determine whether or not definite permanent employment is under way, for much depends upon the purchasing power of the farmer. Better business conditions are directly traceable to the harvest and the movement of crops. It is stated that among manufacturers and jobbers of agricultural implements prospects are not very encouraging.

### FIRESTONE CUTS OUTPUT

AKRON, OHIO, Sept. 8—The Firestone Tire & Rubber Co. has decreased production from 28,000 to 25,000 tires a day to conform with a decline in sales. The slump is seasonal and has been expected. Further reductions in output will be made as sales fall off with the end of the touring season.

## METAL MARKETS

**A**LTHOUGH no flourish of orders accompanied the steel market's entrance upon its autumnal activity, there is no denying the change in the atmosphere from that of mid-summer. To the superficial observer it might appear that producers had suddenly acquired a greater amount of backbone. Such a deduction, however, leaves the real cause concealed. In a period of liquidation there are always sharp declines which become less and less marked as the equation of supply and demand is approached. While the potential supply of steel is probably three times as great as the present demand, over-production has ceased so that for the time being supply is more nearly on a par with demand than it has been in a long time. Moreover, price levels have settled on a fairly rational basis. They represent, on the whole, an advance of about 60 per cent over the 1914-1915 "low". This 60 per cent represents the actual increase in labor, fuel and taxes while freight rates are still twice what they were at the outbreak of the European war. Reduction of freight rates is confidently expected in the course of the next few weeks. In fact, definite announcement of a sharp cut in transcontinental rates on iron and steel is scheduled for early in October. Additional shading of labor costs is also under way. It is only natural that producers should claim that in their present quotations they have discounted all these economies. When they are once put into effect, it will depend upon the extent of the demand for steel whether their attitude or that of consumers who hold that all such reductions should be subtracted from the price of steel, will prevail. In other words, these savings in costs will form debatable ground between buyer and seller. Until they materialize, however, the enhanced stability of steel prices, which is the outstanding feature of the present constellation, must be reckoned with by consumers. There has also been in evidence a marked lessening in the floating supply of resale steel, most of it having passed into hands which will hold it for consumption.

**Pig Iron.**—Although the present quota of pig iron buying hardly justifies the advances which have been put through, producers appear to have recovered sufficient strength to dictate prices. What little buying there is by automotive foundries in the Middle West, is at the advanced rates. Many automotive foundries provided themselves with fairly good-sized stocks while low prices prevailed.

**Steel.**—Interest on the part of automotive consumers who used to buy sheet bars for conversion, has died out and, although the \$30 level seemed very attractive, very little in the way of purchases is reported. The price on full-finished automobile sheet appears to be a matter of individual negotiation. Some of the old-established mills refuse to meet the prices quoted by newcomers in the field. The former claim to know the difficult specifications which accompany orders for this class of sheets and assert that any mill which cuts below the base price of 4.70 for No. 22 gage is cutting under cost. In quite a few instances mills that set the pace in price failed to secure the business. Several large tonnages of sheets are in progress of negotiation. The same is true of bolts and nuts.

**Aluminum.**—Better inquiry is noted in the market for aluminum sheets. Sellers are quoting 31¢. Some consumers are seeking

to buy 98 to 99 per cent virgin ingots at below 19¢ but holders apparently refuse to go below 19.50¢, some asking 20¢ for duty paid metal.

**Copper.**—The market continues unchanged and easy to weak.

**Tin.**—On the basis of the improved statistical position, the market displays a somewhat better tone.

**Lead.**—As the result of the resumption of activities by Australian lead smelters, the international position of this metal has become somewhat confused. The American market continues steady with battery makers buying in routine quantities.

**Zinc.**—The zinc market continues in the doldrums.

## FINANCIAL NOTES

**Southern Motors Co.** of Louisville has been purchased by L. J. Hannah, vice-president of the company, and Lee Miles, president of the Louisville Taxicab & Transfer Co. The late A. T. Hert was one of the principal stockholders in the company at the time of his death, and stock of the Hert estate was included in the transaction. The company is capitalized at \$125,000. Amended articles of incorporation were filed immediately, changing the name of the company to the Hannah-Miles Co. The concern will continue to handle Dodge Bros. cars exclusively. The amendment was signed by Messrs. Hannah, Miles and A. J. Carroll.

**Martin Tire Corp.**, New York, has declared the regular semi-annual dividend of 4 per cent on its preferred stock, payable Sept. 20 to stockholders of record Sept. 10. In his report to stockholders James Martin, president, declared that sales during the first six months of the year were greatly in excess of those during the same period last year. He said that business during July and August continued to be on the upward trend.

**Ireland & Matthews Mfg. Co.**, Detroit, has announced that it will increase its capital stock by \$700,000. This firm, established since 1889, supplies automobile parts to practically every automobile concern in the United States, mostly metal stampings, ranging from hub caps to instrument board plates.

**Moline Plow Co.** announces that interest on \$4,000,000 notes and payment of \$1,000,000 of these notes which matured Sept. 1 was in default on that date. It was stated that an organization plan has been practically completed and might be announced soon.

**International Harvester Co.** has announced a regular quarterly meeting of directors, which ordinarily would have been held Sept. 2 to act on the common stock dividend, has gone over until the following week, owing to a lack of quorum.

**Portage Rubber Co.** has planned for the floating of an issue of \$1,000,000 first mortgage 8 per cent bonds. All common stock has been withdrawn and new common issued, share for share, to stockholders, with no par value.

**Kelly-Springfield Tire Co.** has announced a quarterly dividend of \$1.50 per share on the 6 per cent preferred stock, payable Oct. 1, 1921, to stockholders of record Sept. 16, 1921.

**Goodyear Tire and Rubber Co.**, stockholders have approved a plan for the dissolution of the New York company.

Maxwell-Chalmers  
Has Plenty of Cash

Reorganized Company Has Over  
\$8,400,000 — Starts Under  
Favorable Conditions

**DETROIT, Sept. 6.**—Favorable conditions under which the reorganized Maxwell Motor Corp. and Chalmers Motor Co., now known as Maxwell-Chalmers Co., start off, are shown by comparing first consolidated balance sheet of the new company as of June 1, 1921, with combined balance sheets of Maxwell and Chalmers companies as of June 30, 1920.

The reorganization had \$7,931,361 cash June 1. It is understood this has since been augmented about \$490,000.

Where the former companies had current liabilities to current assets in ratio of \$54,455,000 to \$33,166,000 the reorganization's current assets June 1, 1921, were \$34,871,224 against current liabilities of \$1,855,179.

## Many Increases

Land, buildings, machinery and equipment are increased \$4,317,000 in the statement of the reorganization. This is due partly to a reappraisal and partly to new construction, chief of which is the general office building at the Oakland Avenue plant.

The balance due from the London account has been reduced to approximately \$1,000,000 since the June 1 statement of the reorganization.

Deferred expenses which were \$592,240 are \$106,848 in the new statement. Deferred liabilities, however, are increased \$10,840,000, due mainly to execution of one, two and three-year notes aggregating \$11,600,000, which represent the funded portion of the heavy current indebtedness of the former companies.

## \$15,886,000 in Reserve

Reserves totaling \$15,886,000 have been set aside by the reorganization compared with \$5,053,000 so set up by the former companies.

With reference to the good will account of \$25,030,296, which stands practically the same, an official of the company points out that there is a possibility of offsetting about \$8,500,000 of this item through unused reserve credits. He declares the reserve account balances are inordinately generous. Around \$500,000 will remain unused in the \$1,081,671 account, carried as a liability for further payments account of purchase price.

Deducting good will account from \$33,696,104 book value of Class B Maxwell Corp. stock, there remains a book equity of \$8,666,000 applying to this class of stock. Adding estimated gains of about \$8,500,000 from over-necessary reserve credits there appears a fund of \$17,166,000 to be divided by 620,179 shares of Maxwell B stock, or a book value of \$27 per share after deducting the entire good will account.

## MEN OF THE INDUSTRY

**Cassius F. Baker**, better known throughout the trade as "Cash" Baker, has resumed his connection with the National Motor Car & Vehicle Corp., Indianapolis, as district sales manager for Michigan, Ohio, West Virginia and western Pennsylvania. Baker is one of the veteran factory salesmen in the industry, starting back with the old Pope Toledo, from there to the American and Fiat to National. About three years ago he left National to represent another line. This connection he severed Aug. 14 to again sell National motor cars.

**A. C. Maucher**, who was connected with the Peerless and the Cadillac cars in Philadelphia for fifteen years and lately with the Standard Steel Car Co. of Pittsburgh, in sales, advertising and production capacities, recently resigned from the latter company to become general manager of the Ray Battery Sales Corp. of New York, distributing the Ray storage battery in the eastern part of New York State and northern New Jersey. The sales headquarters and service station are located at 1926 Broadway, New York.

**Guy W. Vaughan**, while still remaining a vice-president and a member of the board of directors, has resigned as general manager of the Van Blerck Motor Co., Monroe, Mich., and has taken up the duties of vice-president and general manager for Standard Steel & Bearings, Inc., Philadelphia, Pa., manufacturers of ball bearings. Vaughan is succeeded at Monroe by **George Sykes**, who has spent six years with big German electrical interests in their engineering, manufacturing and sales activities in Europe.

**Frank Johnson**, a well-known automotive engineer, has just joined the engineering staff of the Cadillac Motor Car Co. at Detroit. Johnson began his automotive career in Detroit in 1900. He was chief draftsman and designer of the Cadillac automobile and also on the tools for manufacturing the car. For the last several months Johnson has been associated with **George H. Layng**, vice-president of the Cadillac Motor Car Co., in the manufacturing department.

**Guy M. Collette** on Sept. 1 became general manager of the Lambert Tire & Rubber Co. of Akron. He succeeds **John Hausam**, who continues as director of the company, but will give his active interest to other lines. Collette was for a number of years assistant cashier of the Diamond Rubber Co. He was long the chief clerk of the Firestone advertising department. Prior to joining the Lambert company he was with the Whitman & Barnes Mfg. Co. of Akron.

**C. C. Cottrell**, former Nevada State Highway Engineer, has assumed his new duties as manager of the good roads bureau of the California State Automobile Assn., in succession to **Ben Blow**, who resigned recently to become manager of the Victory Highway Assn., with headquarters in Kansas City. Prior to his appointment to the Nevada job Cottrell was superintendent of construction for the California State Highway Department from 1913 to 1917.

**Howard A. Coffin**, formerly manager of the Distel Wheel plant of the Detroit Pressed Steel Co., has gone with Cadillac Motor Car Co. as assistant to the president. It was recently reported that he was going with a refining company as vice-president, but he has changed his plans and has already assumed his duties with the Cadillac organization.

**A. E. Vinton**, formerly with the National, has returned to become assistant sales

manager. Vinton left National three years ago to become sales manager for the Mansfield Tire & Rubber Co. Other additions to the National sales department are **H. J. Ayers**, **L. A. Bell** and **A. H. Vay** as district representatives.

**Charles S. Turner**, who for some years has been in charge of export sales of automotive equipment for the Robertson-Cole Co., has joined the sales department of the Liberty Motor Car Co., Detroit, in an executive capacity. His duties with the Liberty company will include both foreign and domestic business.

**W. Clark Little**, for eighteen months in an executive capacity with the Snodgrass & Gayness advertising agency of New York, has joined the Anderson Motor Co. of Rock Hill, S. C., in the capacity of advertising manager.

**Charles B. Seger**, president of the United States Rubber Co., has been elected chairman of the board to succeed the late Colonel S. P. Colt. Seger remains as president also. **Lester Leland** continues as vice-chairman of the board.

**Henry G. Shirley** of Maryland has been appointed chairman of the Good Roads Board of the American Automobile Association. He was the first president of the American Association of State Highway officials.

**Chas. L. Pouncey**, formerly shop instructor in the automotive division of the A. and M. College at Bryan, Tex., has accepted a similar position with the American Automotive School at Dallas, Tex.

**W. A. Murfey** has resigned as sales promotion manager of the Standard Motor Truck Co., Detroit. He has not announced his future plans.

## INDUSTRIAL NOTES

**McKay Carriage Co.** of Grove City, Pa., have just completed a new addition to their plant which will more than double capacity. The building is of brick and structural steel with Lupton steel sash of wire glass which gives ample light and ventilation. The new plant has the latest electric equipment and automatic sprinklers. This building will be used for manufacturing of bus and school bodies, which the company manufactures for all types of chassis.

**Johnson Spring Co.**, Kansas City, Mo., has been incorporated and is planning to secure permanent and adequate quarters. It will make springs for motor vehicles. **H. A. Daugherty** and **Estel Scott**, well known in motor car and truck circles, are among the incorporators.

**South Bend Wrench & Tool Co.** has been incorporated at South Bend, Ind., with a capital stock of \$10,000. The organizers of the company are **Jas. C. Romanie**, **B. V. Romanie** and **Emmet S. Webster**. The company will manufacture automobile tool supplies.

**Oshkosh Tractor Co.**, La Crosse, Wis., has secured an order for 25 Model H Happy Farmer tractors to be shipped to Paris, France, immediately. This is the first foreign order that the new organization has received.

**Rolls-Royce of America, Inc.**, has announced a delay of three or four weeks beyond September 6 in the resumption of duties. The slowness of deliveries of automobile bodies by coach builders is said to be the chief reason.

**Kroyer Motors Co.**, Stockton, Cal., invested in thirty acres of ground and buildings, approximately \$175,000.

## BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

**NEW YORK, Sept. 7**—The ease of the local money market last week in the face of first-of-the-month's settlements and crop moving demands is an indication of the substantial improvement which has taken place in the banking and credit situation. Call money covered a range of 4½ per cent to 5½ per cent against 5 per cent to 5½ per cent the previous week. The renewal rate did not get as high as 5½ per cent until Thursday. "Outside rates" were as low as 4 per cent and 4½ per cent. Time money remained unchanged at 5½ per cent to 6 per cent in a quiet market with little demand and few important transactions. Commercial paper rates were unchanged from those prevailing in the previous week.

## Reserve System Improves

The Federal Reserve System continues to show a steady improvement. On Aug. 31, the ratio of total reserves to deposit and Federal Reserve note liabilities combined was 66.8 per cent as against 66.5 per cent the previous week. The ratio of gold reserve to Federal Reserve notes in circulation after setting aside 35 per cent against deposit liabilities increased from 87.7 per cent to 88.5 per cent. This improvement was a result largely of increased gold reserves of \$21,983,000, a decline in total bills on hand of \$3,305,000 and in note circulation of \$4,448,000. Total deposits increased \$17,123,000. Similar improvement was made by the New York Federal Reserve Bank whose ratio increased from 74.6 per cent to 75.5 per cent.

## Failures on Increase

Business failures during the month of August again showed an increase. While failures for the month were below the maximum for the year as regards both number and amount, there was an increase of 8.2 per cent in the number of failures, as compared with July. The August failures numbered 1562 and the liabilities involved amounted to \$42,904,409. The corresponding figures for July were 1444 and \$42,774,163, respectively.

R. E. Cowden Receiver  
for Master Rubber

**DAYTON, OHIO, Sept. 8**—Robert E. Cowden has been appointed receiver for the Master Tire and Rubber Co., a \$1,000,000 corporation. His bond was fixed at \$25,000. Application for receiver was made by the Jenckes Spinning Co. of Pawtucket, R. I., the largest creditor.

The Master company is one of five Dayton corporations which tried to re-finance themselves through the French-Worthington "swindle gang." Attorneys said the receivership action was necessary before a reorganization could be effected.

# Calendar

## SHOWS

Sept. 5-10—Indianapolis, Automobile and Accessory Show in conjunction with Indiana State Fair conducted by Indianapolis Automobile Trade Association, John B. Orman, Mgr.

Sept. 28 - Oct. 8—New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.

Nov. 14-19—Jersey City, Second Annual Automobile Show of Hudson County Automobile Trade Association, Fourth Regiment Armory.

Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.

January—Chicago, Automobile Salon, Hotel Drake.

Jan. 7-13—New York, National Automobile Show, Madison Square Garden, Auspices of N.A.C.C.

Jan. 28-Feb. 2—Chicago, National Automobile Show.

Coliseum, Auspices of N.A.C.C.

Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.

Sept. 9 to 17—Ottawa, Ont., Can.—Ottawa Motor Show.

Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

September—Buenos Aires, Argentina, Passenger Cars and Equipment, La Pabellon de las Rosas, Automovil Club Argentino.

September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery, Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.

Sept. 23-Oct. 2—Berlin, German National Automobile Show, Auspices of German Automobile Mfg. Ass'n and German Automobile Club.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12—London, British Motor Show, Society Motor Mfrs. and Traders.

November 7-14—Paris, Seventh International Exposition of Aerial Locomotion in the Grand Palais of the Champs Elysees, Held by the Chambre Syndicale des Industries Aeronautiques.

March, 1922—Santiago, Chili, Annual Automobile Show.

May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.

Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Associao Automobilista Brasileira.

## CONVENTIONS

Sept. 14-15-16—Cleveland, Second International Cost Conference, Auspices National Association of Cost Accountants.

Sept. 14-15-16—Detroit, Credit Convention Motor and Accessory Manufacturers Association.

Oct. 12-14—Chicago, Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

Nov. 22—New York, Convention of Factory Service Managers, National Automobile Chamber of Commerce.

Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

## Goodyear Textile to Pay a Dividend

**Tire Company in California Has Deficit, However, of Approximately \$2,400,000**

LOS ANGELES, Sept. 6—The Goodyear Textile Mills Co. will begin the payment of dividends next Oct. 1. The Goodyear Tire and Rubber Co. of California has a deficit of approximately \$2,400,000 which must be paid before dividends can be declared. The latter company has been operating at an average profit of \$200,000 for the past four months. The financial status of the Goodyear companies in Los Angeles was thus stated by President E. G. Wilmer at the close of the directorate meetings held here.

F. A. Seiberling, J. S. Willaman and J. R. Reilly were replaced on the board of directors of the Goodyear Tire and Rubber Co. of California by Wilmer, G. M. Stadleman and P. W. Litchfield. Wilmer, who is president of the Goodyear company of Akron, succeeds Seiberling as president of the California company.

Seiberling, S. A. Steere and C. N. Turner were replaced on the board of directors of the Goodyear Textile Mills Co. by Messrs. Wilmer, Stadleman and Litchfield and Wilmer was elected president of that organization, succeeding Seiberling. The board of the textile company declared a quarterly dividend on its preferred stock of 1½ per cent payable next Oct. 1 and it was announced that when, and as the company's situation will permit. Three dividends have been passed.

Wilmer stated that the textile company now has a surplus sufficient to cover all dividends in arrears, but that, due to investments in inventories, etc., the directors deem it advisable to restrict the present declaration to the dividend to be paid in October.

## N. A. C. C. Report Shows August Shipments 2% More Than Those of July and 72% of August Last Year

NEW YORK, Sept. 8.—Reports of August shipments of cars and trucks made to the National Automobile Chamber of Commerce by its members show that there was an increase of 2 per cent over shipments for July and that the total was 72 per cent of the shipments for August, 1920. In August last year shipments were 14 per cent less than in July. Shipment figures by months thus far this year are:

	Carloads		Driveaways		Boat	
	1920	1921	1920	1921	1920	1921
January	25,057	6,485	29,283	3,185	....	93
February	25,505	9,986	43,719	7,507	....	99
March	29,326	16,287	57,273	9,939	....	75
April	17,147	20,187	64,634	14,197	....	1,619
May	21,977	18,608	74,286	15,193	....	2,381
June	22,516	20,269	60,746	18,834	8,350	3,947
July	23,082	19,470	52,342	15,320	8,702	3,725
August	23,386	20,350	34,060	14,290	7,095	3,565

Wilmer's outlook on the future of the local Goodyear organization is optimistic. While the present rate of profit will pay off the deficit in a year Wilmer declined to make a prediction as to the probable time when the tire and rubber company can pay dividends. He stated, however, that some months recently have shown a greater profit than \$200,000 and expressed his belief that the company's business outlook is excellent.

## St. Louis Company Will Make Cars to Suit Taste

ST. LOUIS, Sept. 7—A new and novel idea in the manufacturing of a tailored automobile, outfitted to suit the taste of the purchaser with color scheme to match is to be built in St. Louis. John M. Neskov, president of the Neskov-Mumperow Motor Car Co., who has been known for several years as distributor of the Anderson car and dealer in Dort and Gardner lines, is the originator of the plan.

Neskov is now forming a corporation backed by ample capital which will manufacture the new car. The first production, however, will be by the Neskov-

Mumperow Motor Car Co.

The first two cars are now in construction and will make a bow to St. Louis motorists at the Automobile Exposition to be held in the General Motors plant in St. Louis Oct. 15 to 22.

The standard models will be a four-passenger sport car and a speedster for three people, both built along unusual and striking lines as to bodies. It is the aim of the builders, however, to give the purchaser what he wants in the way of novelty of body design and lines or in effect a custom-built automobile.

The new car will be equipped with a Weidely four-cylinder motor, 3½ x 5½ bore and stroke, Bosch magneto, Bosch generator and starter, Muncie transmission and clutch, Salisbury three-quarter floating axle. The chassis will have a frame 7½ inches deep. The Weidely motor has overhead valves with force feed lubrication and aluminum crank case and flywheel housing.

Both models will have a 125 inch wheel base with 60-in. rear and 39-in. front springs. A very novel system of lubrication for all springs and other bolts is a patented hollow bolt, a type which will be filled with oil providing for lubrication from four to six months.

THE high standard of performance of all ATWATER KENT products is attributed to the care and attention given to engineering detail; the absolutely correct design; the accuracy and precision of manufacture.

ATWATER KENT products will last and properly perform their mechanical function for years—in fact long after the car of which they are an essential part has outlived its usefulness.

ATWATER KENT MFG. COMPANY

*Philadelphia*

In the great Continental plants, EFFICIENCY greets the observer on every hand. It is seen in mechanical operations where simplicity has supplanted duplication and it is revealed in the clock-work routing and progress of motors under construction. ¶ These examples, however, are but manifestations of the wonderful co-ordination of effort that the industry calls Continental EFFICIENCY—co-ordination of effort

internally in every phase of motor building and co-ordination externally in hand and glove co-operation with the entire transportation world. ¶ It is only natural, therefore, that the product of this great organization, in its smooth-running precision of operation, should possess that rare degree of motor EFFICIENCY that always has been associated with—the Continental Red Seal.

## Stability as Related to Present Price Trends

Price cuts have a psychological effect upon the mind of the buying public. Stability, viewed as a moving state of balance, can be achieved on a sound economic basis. A discussion of fundamentals.

By Norman G. Shidle

**S**IMILAR effects do not always grow out of similar causes. This is especially true of the recent price flurries in the automobile industry. The general reduction in prices which followed Ford's initial cut some months ago was a logical fall from wartime values. It was a logical step in the general deflation—a step taken on a sound basis of practical economics. The causes for a general reduction of prices at that time were clear and the same causes affected the entire industry in common.

The present situation is more complex. There is no common cause for price reductions. Despite the fact that reductions have been widespread during the last two weeks, an analysis of the situation indicates a great variety of reasons for the cuts. In almost every case where a reduction has been made, the reason appears to lie in certain individual factors affecting the company concerned. That no common basis is to be found in the present situation is indicated by the fact that cuts have been made both by companies whose sales have been exceptionally good during recent months and also by companies whose sales have not reached satisfactory levels during the same period.

An attempt to analyze and discuss the different reasons for present reductions would be as difficult as it would be useless. The immediate problems which

confront the manufacturers are individual and will be solved on the basis of the peculiar factors involved in each particular case.

There is a definite value, however, in discussing at this time certain fundamentals, the operation of which will determine the progress of the industry in the long run. While forces bearing upon an individual concern at present may necessitate certain temporary measures, an attempt to keep these temporary measures as closely as possible in line with the fundamentals will hasten the return to stability.

Stability in the automobile business during the next few years must be conceived, not as a stationary state, but as a state of constantly changing fixed ratios. The industry must be kept in balance, but not necessarily at a constant level. Stability of prices is essential if sound and permanent buying is to be stimulated, but the term need not be conceived to mean that prices will never change. They must be fixed for a period long enough, however, to restore public confidence in the relative value of the product which it buys.

A price war at this time would be ruinous to the industry. This fact is so obvious that it is hardly necessary to state it, yet its importance is so great that it can well be emphasized. An indiscriminate cutting of prices, based only on

guesswork and the price of competing makes, a level of prices changing every two or three months, would simply throw the buying market into confusion, cause untold financial stress among manufacturers, add heavy burdens in the way of unemployment and reduced wages to thousands of workers, and benefit very few, if any, of those involved.

Stability of prices need have no relation to agreements among manufacturers. It should have none. Price agreements do not have a sound economic basis and cannot therefore form the basis of permanent progress. An agreement as to the basis of prices, however, is a different matter.

It is sound economics to manufacture a product as efficiently as possible, to maintain a certain predetermined quality, to merchandise it as economically as possible, and to sell it at a price which gives a fair profit to the manufacturer and the dealer and a fair value to the buying public. This is easier to say than to do. But since it constitutes the only permanently sound and economic basis for selling prices, an attempt to establish such a basis and operate upon it eventually will be found essential.

Prices of materials vary, of course, and affect costs materially. Wage rates vary, production methods vary, merchandising costs vary and hundreds of other minor variables operate to make difficult an accurate determination of costs at any given time. Especially is this true when there is a falling market. Under any conditions, however, sound cost data are essential as a basis of any business or manufacturing operations. Such data are compiled, more or less accurately, in every manufacturing establishment. Incidentally, there is still progress to be made in cost methods.

In any case, the selling price should bear some definite relation to the production and material cost, taking into consideration, of course, market trends and other variable factors. On such a basis, selling prices should be stabilized for a period of a selling season. The period must be long enough to convince the public that prices have been established upon some sound basis. This cannot be done, however, until prices actually are so adjusted.

Price reductions are a part, of course, of merchandising plans, and like other merchandising plans cannot be permanently successful if guesswork is used in determining them. Prices are in a sense the foundation of the merchandising scheme. It should be recognized that stability is likely to be a far more essential factor than is generally recognized. With a sound basis for prices, as indicated previously, fluctuations would take place only when essentially changed conditions indicated the necessity for change and the fluctuation would be such as to preserve the fixed relation between the various factors in the market.

Last week Harry Tipper wrote, "There is no likelihood of a return to the days of easy selling, but there is every prospect of good business for the man who goes after it, who sees that his product is suitable to the market and that it is valued in accordance with its service." The present price flurry adds to the difficulties of the manufacturer in selling, because he must convince the public of the value of his product. He can hope to do this only when he has actually priced that

product on a sound economic basis.

Some of the price cuts already made have obviously been made on that basis. The reason for others is not so clear. Certainly the general situation indicates that there is an opportunity for a stabilization in the near future, however, as price curves in many raw materials give strong indications of straightening out.

Constantly recurring cycles of price reductions are certain to have an unfavorable effect upon the public mind. If automobile prices continue to vary, when the price curve on raw materials shows a strong tendency to straighten out, the public is likely to come to the conclusion that automobile prices have not been on a sound value basis in the past and that perhaps they are not at present. Such an attitude would result in a "let's-wait-a-while" buying policy.

Last June AUTOMOTIVE INDUSTRIES quoted the sentiment of those present at the annual N. A. C. C. meeting as summing up something like this:

"It is up to the industry to settle the price question right now and end the feeling of uncertainty that exists in the public mind. People do not buy on a falling market and we must stabilize values immediately." This sentiment indicated a very clear understanding on the

part of manufacturers as to the necessities of the situation. The statement applies equally well at the present time. The buying public is composed of individuals very much like the manufacturer himself. Each of these individuals is likely to reason about automobile prices along the same lines as anyone else.

The necessity for stability and the establishment of mutual confidence between the industry and the public and between the various parts of the industry is clear. The failure to recognize a moral obligation in regard to contracts and similar relationships within the industry can never lead to permanent advantage. The recognition of such an obligation has no relation to altruism; it has come to be simply a principle of good business. Mutual confidence can be established only through an attempt at utter fairness all along the line.

One executive within the industry analyzed the situation about like this a few days ago: "Much of the difficulty," he said, "lies in the lack of mutual confidence within the industry. Many purchasing agents are buying for very limited periods ahead because they are uncertain about the price of parts and raw materials. On the other hand, the parts people are afraid to take big contracts and really get into production on them because they are afraid of cancellations. This lack of mutual confidence is costing the industry many dollars every month at the present time."

This has a definite relation to the price question and must be considered as an important factor. Modern industry is composed of a multitude of closely interdependent units and can permanently progress only through a recognition of a moral obligation. The extent to which this is understood and practised will have a large part in determining the facility with which the general readjustments can be made.

In any case, the price future most advantageous to the industry lies in a stabilization, subject to periodic readjustments during the next few years, none of which need disturb the fixed relation of the relative values when made on a sound economic basis of production and material costs.

---

**P**RICES must reflect economic value, and adjustments be made on that basis. Stability may be conceived during the next few years as a state in which balance is preserved, although levels may be changed at periods sufficiently far apart to allow fluctuations to depend upon economic trends and production costs.

---

# A New Bus Chassis Developed by International Motor Co.

Rubber shock insulating blocks used in place of metal spring shackles, 34 in. wheels, and mounting of body floor directly on frame give much lower center of gravity, while riding qualities with cushion tires are said to equal those with pneumatics and to give lower operating costs.

By Herbert Chase

THE International Motor Company, in common with many other truck manufacturers, foresee unusual activity in the bus transportation field, and on this account have undertaken the development of a special bus chassis intended to meet the requirements of this class of work. While the chassis is identical in most respects to the standard 2½-ton Mack AB dual reduction chassis, several new features are incorporated. Of these the newest and most unusual is the use of rubber shock insulating blocks in place of the usual metal spring shackles.

From the accompanying cut it will be seen that blocks of rubber placed under compression in boxes provided for the purpose carry the ends of the springs and thus eliminate metallic contact between the spring and frame members. The rubber blocks are made of especially cured compound similar in some respects to that used in certain grades of solid tires. The boxes used in place of the usual spring brackets are made in two sections. The upper half is riveted to frame in much the same manner as the ordinary spring bracket, while the lower half is bolted to the upper portion. When bolted in place the rubber is placed under a compression about 80 lb. per square inch. The ends of the springs are embedded in the rubber blocks in such a way that the springs can deflect as well as take thrust in the usual manner. In the case of the rear springs the ends of the two upper leaves are carried between two metal liners

riveted to the ends of the leaves and in contact on their outer surface with the rubber blocks. The liners increase the area of contact with the rubber, thus decreasing any tendency for wear between the two surfaces. The metal liners are omitted in the case of the front springs, since these have much less motion than the rear springs. Hotchkiss drive is employed in the same manner as when spring shackles are used.

Among the advantages claimed for the use of rubber shock insulators are the following:

1. No lubrication required.
2. Upkeep much less, since no grease cups and no grease or oil is required, and no cleaning is necessary.
3. Ability to insulate the frame from many shocks ordinarily transmitted from the springs, and thus improve riding qualities of the vehicle.
4. No friction between surfaces, consequently no wear, looseness or rattle.
5. The rubber tends to compensate for twisting action between spring and frame.
6. Side and end thrust taken without metal-to-metal contact.
7. Less horizontal motion of axle, because springs elongate from middle toward both ends. This makes for better steering and tends to prevent unnecessary brake action.
8. Tends to reduce so-called "crystallization" of the frame, steering gear parts and other members due to vibration transmitted by shackles of the older type. For same reason the tendency of nuts and rivets to loosen is decreased.
9. Increase in the life of the tires.
10. Does away with shackles, spring eyes,

Side view of the new Mack bus chassis. Note relatively low steps and body floor

Rear spring suspension used on new Mack bus chassis, showing brackets containing the rubber shock insulators and the rear truss bracket

bushings, hardened and ground steel shackle pins, grease cups, shackle bolts and nuts. 11. Two or more main leaves of the spring can be made to bear in the rubber, thus giving added strength. 12. Spring construction is simplified and cheapened, since no wrapped eye is required. Cost of assembly and replacement is also less than with spring shackles.

The manufacturers state that the temperature of a spring used in combination with the shock insulator was 20 deg. Fahr. lower than in the case of a spring without shock insulator and using the old type shackle under similar conditions, indicating that frictional losses are decreased. A 20,000-mile test run on a chassis using the rubber insulators is said to have indicated that they will stand up for at least 25,000 miles running. The eight insulators used on each truck can, it is said, be renewed by two men in about one hour at a total cost of less than \$50, while it is necessary, with the ordinary spring shackle, to renew bushings once in 10,000 miles, this job requiring the labor of two men for about 8 hr.

The rubber shock insulators are supplied only on passenger-carrying vehicles and usually with cushion or high profile tires. The bus chassis is equipped with Kelly-Springfield caterpillar No. 23 compound 34 x 5-in. tires front and rear, the rear tires being dual.

The writer was shown numerous records made on a seismograph to determine the relative ease of riding of the shock insulated bus and a similar bus equipped with pneumatic tires. These appeared to indicate that the insulated bus is quite the equal if not superior in riding qualities to the pneumatic equipped job, and the makers so regard it. The International Motor Co. believes the use of solid tires is preferable to the use of pneumatic tires for bus service, partly on account of the economy of tire expense and partly because of avoidance of the

danger which is said to be involved in operating a heavy vehicle at high speed in case a large pneumatic tire blows out. The following figures on the relative cost of operation with solids and pneumatics are given by the International company: "On buses operating 50,000 miles annually five or more sets of pneumatic tires are required per year, costing not less than \$3,200. For a bus equipped with rubber shock insulators three sets of solid tires should cover a year's operation at a cost of approximately \$970—thus producing a net saving of \$2,230 per year, or nearly 4½ cents per mile."

One other feature which materially affects the riding quality of the Mack bus is the use of unusually long rear springs. These measure 60 in. from center to center of the spring brackets.

It will be seen from the accompanying drawings of the bus chassis and body that the latter is designed to carry 25 passengers. The cross seat arrangement shown gives a maximum of seating space. In case the bus is used in traffic which requires more standing room, this can be provided by other arrangements of the seats. In order to give the required body space it has been necessary to materially lengthen the frame and wheelbase of the chassis. This, in turn, has made necessary a reinforcement of the frame by means of truss members on each side. A combination wood and metal truss is employed, as shown in the accompanying cut.

The tension member of the truss is a steel rod with a round threaded section at each end, but flattened into oblong section between ends. This flattened section is mortised into the wooden filler member and is tightened by nuts which pass through substantial brackets riveted to the frame at points aft of the rear front-spring bracket and aft of the front rear-spring bracket. By use of this construction the disadvantages of the ordinary open truss, which localizes frame stresses, is said to be eliminated, since the wooden filler bears against the frame channel on its upper edge and the truss rod on its lower edge throughout its entire length.

One of the disadvantages of using an ordinary truck chassis in combination with a bus body is the fact that the body is much higher from the ground than desirable, and is consequently more difficult of entrance and exit than a lower body would be. The higher center of gravity detracts from the riding qualities and causes greater tendency for the bus to sway or tip over when rounding curves. For these reasons an effort has been made to lower the bus body in the design of the Mack bus chassis. This has been accomplished by use of a 34-in. instead of a 36-in. wheel, by elimination of the spring shackles and by mounting the floor of the bus body directly on the chassis frame in the manner indicated in the accompanying transverse sectional view of the body. The photograph of the Mack shock insulated bus beside a bus of older design mounted on a higher chassis frame and

View showing comparative platform height of the Mack shock insulated bus and a bus of the same make but earlier design equipped with pneumatic tires

Plan and elevation of the Mack shock insulated bus chassis with body mounted in position. Note dimensions and height of body floor, which is mounted directly on chassis frame; also details of fastening floor to frame.

Sectional views of the front and rear brackets for holding the rubber shock insulators which support the spring ends

equipped with pneumatic tires gives an excellent opportunity to judge of the decrease in height which has been effected. The difference in height to the top of the chassis frame is 7 to 8 in.

Other particulars in which the bus chassis differs from standard Mack AB truck chassis are as follows:

The muffler pipe is extended to the rear of the chassis in order that the exhaust gases may not enter the body in the vicinity of the entrance door. The gasoline tank is located outside of the body in the rear of the chassis, fuel being fed to the carburetor by means of a vacuum system.

The engine is substantially the same as that used in the truck chassis, except for slightly different clearances used on pistons and valves made necessary by the fact that the engine runs at a higher governed speed than in the case of truck applications. The engine is governed to 1425 r.p.m., as against 1275 for the standard truck engine.

The four-speed gearset, dual-reduction rear axle, the front axle, steering gear and other mechanical units are substantially the same as those used in the truck chassis.

The standard bus body is substantially built. All body frame members are of first-quality, thoroughly cured oak with mortise and tenon joints set in white lead and dowelled with oak pins. The floor of the body is of 1¼-in. tongue and grooved maple, with maple wear strips attached. The seats are carried on light, pressed-steel pedestals. Seat cushions are given a tilt aft, are covered with imitation leather and provided with comfortable springs.

A two-leaf folding door is provided at the front of the right side of the body. It is arranged for operation by the driver from his seat. Three steps, the height of

which is shown in the accompanying drawing, are provided at the entrance. An emergency exit, which can be opened from the inside in case the entrance door is blocked by accident or otherwise, is provided. The windows are equipped with anti-rattlers and have movable lower sashes which drop into the casing beside the seats. Eight electric dome lights are distributed over the ceiling, and a step light, located inside the body, is so arranged as to be lighted automatically when the door opens. A heating system, using exhaust from the engine, is provided. This consists of two lines of guarded pipe running the full length of the body on each side near the floor. A valve controlling the by-pass of exhaust through the heating system is located under the floor near the entrance door. Two front and two rear ventilators with shutters are provided. Advertising racks for standard size advertisements extend along the inside of the body on both sides above the windows.

The bus is, of course, arranged for one-man operation. The driver is protected by a rail, and a sliding curtain placed back of the driver's seat prevents reflection of light on the windshield when driving at night. A mirror placed over the operator's seat is arranged to give him a view of the interior of the bus and, through the rear window, of the road behind.

The length of the body inside at the seat line is 18 ft. and the width at the same point 6 ft. 7 in.

A detail of one truss rod bracket. One end of the truss and a sectional view through truss and frame are also shown

The following additional body equipment is furnished at extra cost. Newbold lighting system, consisting of a special generator with automatic regulator arranged to charge the battery and feed the lighting system at a constant rate irrespective of speed of engine. Electrically lighted roller destination signs. Electric buzzer system with buttons located on window posts. Spring-roller window curtains, spring-edged cushions, ceiling of Agasote or similar material attached to roof bows, and fare register.

The price of the bus chassis with 25-passenger body and standard equipment is \$6,730.

## A Rolled Steel Truck Wheel

**A** ROLLED steel truck wheel in which the rim and spokes are formed in one piece is now being produced

The Bethlehem rolled steel wheel constructed from I-beam by stamping and forming operations.

by one of the large steel manufacturers. The blank from which the wheel is formed is stamped in the first instance from a special rolled I-beam, portions of which form the spaces between spokes being cut away before the forming operation is started. When the wheel has been formed to assume a circular shape, the ends of the flange which then becomes the rim of the wheel are welded together, and the inner spoke ends are bolted to a central hub member, alternate spokes being staggered and bolted to opposite sides of the hub flange. The wheel forms a rigid structure which is said to compare favorably in weight with that of a wood wheel, and to be amply strong to withstand the most severe radial loads and side thrust as well as torsional strains. A rear wheel with brake drum attached is shown in the accompanying cut. Front wheels are identical except for the hub construction and elimination of the brake drum. The chain hooks shown in the cut are cold riveted to the rim of the wheel when desired. The entire wheel is manufactured from the raw stock by the Bethlehem Steel Corporation.

# Producer Gas as a Fuel for Automotive Vehicles

## Part II—Descriptions of Existing Systems

British engineers have developed three gas producer systems intended for use on trucks. A description of these systems and their method of operation is given herewith. 300 lb. of coal will, it is claimed, drive a truck 100 miles, or about the same distance as 20 gal. of gasoline.

By P. M. Heldt

**A**T least three different gas producers for use on motor trucks have been developed in Great Britain. These are described here briefly and illustrated to show the methods employed for overcoming various difficulties. Among these difficulties is that due to the volatile constituents and the carbon dust carried along by the gas, which has already been referred to. Another difficulty with producers arises from the formation of clinkers. In the combustion zone the temperature is so high that the ashes fuse into clinkers, which clog the grate and prevent the entrance of sufficient air.

In the ordinary gas producer as used for stationary work there are four zones within the furnace—namely, the ash zone directly above the grate; the combustion zone, in which combustion of the fuel to carbon dioxide takes place; the reduction zone, in which the carbon dioxide formed in the zone immediately below combines with more carbon to form carbon monoxide, and the distillation zone, in which the volatile constituents of the fuel are driven off.

The furnace is lined with refractory material in order to withstand the exceedingly high temperature of the combustion. Fuel is added through a hopper on top,

while air and steam enter at the bottom. All oxygen entering at the bottom combines with carbon in the combustion zone and there is none left to burn the volatile products formed in the distillation zone.

### Smith System

The first of the English producer systems for motor truck use was developed by D. J. Smith, who read a paper on the subject before the Institution of Automobile Engineers some time ago. Most of the following information regarding this system is taken from that paper.

The basic principle of the Smith producer for motor vehicles involves elimination of all zones except the combustion and reduction zones. This has made it possible to greatly lessen the required depth of the producer. The furnace chamber is only 12 in. deep, while the fire itself is about 6 in. deep, this whole depth being incandescent while the producer is in operation. To make it possible to work on this plan it was necessary to feed the fuel continuously in small measured quantities, and to constantly agitate the whole fuel bed so that no holes can burn in it and that all ash may be constantly sifted out. This method of working eliminated trouble from

Truck fitted with Parker gas producer and auxiliary apparatus

volatile constituents, as any fresh fuel added was sifted directly into the incandescent mass of the fuel, and any part not immediately consumed was taken care of by the hot zone above the fire in the producer chamber. It is claimed that clinkering is also eliminated, because the ash is removed as fast as it forms and has no time to fuse. Both the grate and the lining of fire brick are, therefore, kept clean.

### Mechanically Operated Grate

In the Smith system the feed and grate are operated by the vehicle engine, and the ash discharge is also by mechanical means. This latter feature results in two advantages: It eliminates the necessity for an ash pan sufficiently large to carry the ashes formed during several hours' running, and it also does away with the necessity for stopping the engine to remove the ashes. Sectional and outside views of the Smith producer are shown herewith. It is of upright cylindrical form with a fuel inlet and feeding mechanism on top, the fire-clay-lined combustion chamber in the middle, the grate below it, a substantially conical ash pit below the grate, an ash discharge valve at the bottom and various auxiliary devices on the outside.

Referring to the illustrations, A is the fuel inlet pipe; B, the adjustable fuel feed and ash discharge mechanism; C, the fuel feed valve; C', the friction drive for the feed valve; C'', a handle for independent hand operation of the feed valve; D, ash discharge valve; D', friction drive for ash discharge valve; D'', handle for ash discharge valve; E, water pump; F, main operating gear shaft driven direct from engine; G, driving gear for grate bar camshafts, completely inclosed and lubricated; H, pipe carrying steam and air to the bottom of the fire; I, air supply pipe from interior of jacket to vaporizer; J, grate bars pivoted at one end, alternate sections at alternate ends, and vibrated successively by camshafts.

### Vaporizer

Mr. Smith found that for best results in the way of flexibility the water could not be fed to the fire directly, but had first to be converted into steam. In order to keep the quality of the gas constant he uses the air passing to the combustion chamber as a regulating means for the steam supply. A small boiler was fitted to the producer and was heated partly by radiation from the fire and partly by hot gases from the producer passing through a channel in it. The water is preheated by passing through a water jacket surrounding the gas pipe from the producer and is then pumped into the boiler. The jacket on the gas pipe serves as a cooler, which is a feature of most producer gas installations and is par-

Sectional and detail views of the D. J. Smith producer for motor trucks

ticularly valuable where no water is used in the scrubber, as in this case.

If the water in the boiler is kept at a temperature of 180 to 200 deg. Fahr. and the air for the producer is drawn over its surface, it picks up enough moisture for steady loads, but if the load is then suddenly increased the temperature of the water decreases, and the air, instead of getting more moisture, gets less. To remedy this condition a throttle was fitted to the air inlet to the boiler through which all of the air to the producer had to pass. This throttle was interconnected with the engine throttle in such a manner that as the latter was opened the former closed; the result is that an under-pressure is produced on top of the water in the boiler and steam forms more readily.

In this way the proportion of air and steam is always maintained substantially constant irrespective of load on the engine, and the store of hot water in the boiler acts as a reserve to help meet sudden demands.

In order to make the outfit automatic a good deal of auxiliary apparatus is required. There is, first, the

water feed to the boiler which must be so regulated as to maintain a substantially uniform water level, irrespective of the inclination of the road surface. To this end, in the Smith system the delivery pipe (see detail view) is taken into the center of the boiler, where its level with respect to the water does not vary, and it is made to serve also as an overflow pipe. When the water level exceeds that desired, the water pumped is discharged into an asbestos-filled channel Y in the ash pan, where it is vaporized, and what cannot be absorbed by the asbestos is discharged through the ash valve in the bottom of the pan.

The rate at which fuel and water are consumed in the producer depends not only upon the speed but also upon the load carried by the engine, and to take account of this fact the fuel feed device and the water pump are coupled up with the engine throttle so that their strokes are reduced when the throttle is closed. This is said to have given satisfactory results, although with a fuel like coal, containing lumps of varying size, no absolute regulation of the feed is possible.

### Dry Scrubber and Cooler

Smith uses a dry scrubber which merely removes particles of dust in the gas as it comes from the producer. A sectional view of this device is shown herewith. The gas enters at A, passes down a pair of large tubes at the left (which are slightly contracted at the bottom so as to increase the velocity) and is then discharged into a settling chamber B, in which most of the dust collects. The gas passes out of the settling chamber through an annular opening around the large tubes, up one series of tubes and down another, both surrounded with water, and finally passes up a pair of large tubes C on the right, containing a filter of conical shape extending the length of the tubes. Additional dust settles in the tubes, headers and filters, and it is claimed that when the gas finally passes out of the scrubber at D it is as free from dust particles as the air ordinarily taken into carbureters. Quick removable doors E and E' are provided where most of the dust settles, and the apparatus can be easily cleaned. This scrubber also forms a feed water heater. The water from the feed pump enters the scrubber near the bottom at F and leaves through the top opening G. The material found in the filter is merely fuel dust, and it is claimed that no trace of tarry matter has ever been found. In this connection it should be noted that only hard coal or coke is used with this system; Mr. Smith anticipates that for engines with inclosed valves some further filtering may be necessary, owing to the very fine valve stem clearances.

The gas, after leaving the scrubber, can be taken through a water seal, the gas pipe from the scrubber dipping from 1 to 1½ in. into water, the level of which is maintained by a float. A small amount of water will then be carried along into the combustion chamber, but not enough to cause trouble. On farm tractors the scrubber should be so placed that it gets the benefit of the radiator fan blast, and an air washer should be fitted. The water seal or air washer should be cleaned out once a day.

### The Parker System

Another system has been invented by J. W. Parker and is being placed on the market by Producer Gas Plants, Ltd. In this system use is made of a dry gas cooler and dust extractor and a wet scrubber. A demonstration of the system, fitted to a 3-ton truck, was recently given to press representatives in London. A vertical section and an elevation partly in section are shown herewith. The upper part of the producer, which is of

The scrubber designed for use in connection with the Smith producer

square section, forming an inverted truncated pyramid, serves as the fuel hopper and is provided with a cast iron cover held in place by cap screws. Below the hopper is a flat, rectangular gas chamber with a perforated inverted sheet metal funnel which serves to keep the fuel out of the gas main. The firebox is made up of sheet steel, is cylindrical in form and provided with a refractory lining the thickness of which increases toward the bottom. It has a mean internal diameter of 11¼ in. and a depth of 16 in. The firebox is surrounded by an outer jacket of sheet steel which is supported by the same bolts and has the ash pit fastened to it at the bottom. The grate is a single steel casting, pivoted on a cast iron bracket on the bottom of the ash pit, and held in the horizontal position by means of a strut. When it is desired to rake out the fire the ash pit door is opened and the strut pushed back, which permits the grate to be dropped to an inclined position, as indicated in one of the drawings in dotted lines.

### Vaporizer in Grate

Steam for gas generation is produced by means of an annular water trough formed in the grate, into which is placed a loose ring of tee section to prevent it from becoming filled with loose ashes. This simple vaporizer is kept filled with water to a constant level by means of a float. The air for the producer is drawn through the jacket of the furnace, whereby a double object is accomplished, in that the air is preheated and the furnace wall cooled. From the jacket the air passes into the ash pit, thence through the grate and up through the bed of fuel, the gas there formed passing out through the rectangular opening at the side of the gas chamber.

A hand blower is provided for starting the producer. During the early stages of operation a mixture of air and gas is produced in all systems which is unsuitable for use in an engine and which, since it contains a good deal of poisonous carbon monoxide gas, must be carried away so it cannot be inhaled by the attendant. In the

The Parker gas producer designed for use on motor trucks

truck equipped with the Parker system this gas is carried away through a vertical chimney carried up one side of the cab and connected to the gas main between the producer and the cooler. At the bottom of the chimney there is a conical valve by means of which it can be either opened or closed to the gas main.

#### Gas Cooler and Dust Extractor

As already mentioned, an important feature of this system is a gas cooler and dust extractor which works on the dry principle. The upper part of the cooler is cylindrical and is fitted with a number of horizontal tubes, while the lower part is wedge-shaped. The gas enters the cooler centrally on top and first passes through the space between the outer and inner shells. It then changes its direction of motion and passes on into the space through which the tubes pass, and in doing so it deposits out the entrained dust in the lower portion of the cooler. There are plug-closed openings at both ends of this wedge-shaped part through which the accumulated dust can be removed at intervals. Air circulates through the cooling tubes, the cooler being mounted at the side of the truck so that the motion of the latter creates a natural draft through the tubes. Increased air circulation is induced by means of an air ejector connected to the end of the exhaust pipe. The outlet from the cooler is at the top, not very far from the inlet. In the 3-ton truck size the shell has an area of 10.2 sq. ft. and the tubes have an area of 7.3 sq. ft., making the total cooling area 17.5 sq. ft.

#### Wet Scrubber

The scrubber is not unlike the cooler in shape, and in practice is mounted on the opposite side of the truck from it. It also has both inner and outer shells, the former extending down about three-fourths the full depth. The edges of the inner shell are serrated, and to them are riveted angle irons which carry the grid plate on which the bed of pebbles is supported. These pebbles have an average diameter of  $\frac{1}{2}$  in. The bed of pebbles was originally made 7 in. deep, but it was found that 4 in. was all that is necessary, and this, of course, permits of a considerable saving in weight. Through an opening on top the scrubber is filled with water to the level of the bottom of the pebble bed, the level being adjusted in the first place by means of a

standpipe and cock, and later maintained automatically by a float. Gas enters the scrubber on top, passes through the space between the inner and outer shells, turns the corner of the serrated edges on the inner shell in the form of bubbles and then passes up between the pebbles which are kept moist by capillary action. Any tarry matter or dust which may have passed the cooler will adhere to the pebbles. From the top of the scrubber the gas passes directly to the engine. The scrubber must be cleaned out each day, and this is conveniently accomplished by inserting a hose into the plug opening provided for the purpose on top, there being a similar opening at the bottom through which the water can run off. The pebbles must occasionally be given a more thorough cleaning, and to this end they are removed from the scrubber. To facilitate this removal they are now placed in a wire basket. When the truck runs on either an up or a down grade, part of the serrated lower edge of the inner shell will be out of the water, and then the gas does not have to bubble through the water. It has been found, however, that this does no harm, as the water retained by the pebbles is sufficient to effect the purification of the gas during these short periods.

In order to be able to adjust the mixture for maximum power, an air valve is mounted on the dashboard where it can be easily reached by the driver. This is the only adjustment required, and it is said that this adjusting valve needs to be attended to only very rarely. The hopper, of course, must be refilled with fuel at intervals. With this system, foundry coke is used as fuel; ordinary gas coke can be used in an emergency but does not give nearly as satisfactory results. The fuel is broken and screened to approximately 1 in. size.

#### Performance Claims

Following are some claims of performance made by the manufacturers of the Parker producer. The fuel consumption for a 3-ton truck is guaranteed not to exceed 300 lbs. for a 100 mile run under full load. About 20 U. S. gal. of gasoline would be required for the same work. The saving in fuel cost can therefore be easily calculated if the prices of gasoline and coke are known. Mention is made by the firm of the possibility of increasing the compression pressure, and thus further

Above, the gas cooler and below, the wet scrubber designed for use in connection with the Parker gas producer

reducing the fuel consumption, but in this connection it must be borne in mind that this would increase the starting difficulty, as the effort required to crank an engine increases substantially with the compression pressure. On the other hand, as the fuel is always in the gaseous state, the engine should pick up its cycle almost immediately.

Water is used in both the producer and scrubber, and the supply must be replenished occasionally, but the consumption is quite small and the attention required by the water supply is not irksome. About 25 gallons is carried, and the former gasoline tank is usually made to serve the purpose. This supply will last for a week's work. The only wearing part of the outfit is the fire box, which lasts about 6 months. Fire boxes are not relined, but new ones are supplied complete, and their installation is said to be a matter of a few minutes. The cost of the renewal is not high.

### Stewart System

The ordinary producer as represented by the two systems described is known as the up draught system. In order to more effectively dispose of the volatile constituents, the experiment was tried of inverting the process, drawing the air in at the top of the producer and the gas off at the bottom, this giving what is known as the down draught system. In this case, as additional fuel is fed, the volatile products are drawn into the combustion zone and are consumed along with the fixed carbon of the coke. The difficulty with this system is that eventually the fire descends so low that the air cannot get to it any more on account of the intervening layer of ashes, and the ashes even get close to the gas outlet. A compromise or intermediate system has been developed by John Stewart and described by him in a paper read before the Scottish Section of the Institution of Automobile Engineers. The producer comprises two chambers, one vertical and the other, in direct communication therewith, extending up at an angle. The angle chamber is a down draft chamber and the vertical chamber an up draft chamber. Fuel is added at the outer end of the angle chamber through a hopper. Air is supplied at the same point, also water vapor, the vaporizer being located on top of the vertical chamber. When a fresh charge of fuel is added it falls behind the fire, and as the air must be drawn through this fuel there is always air present when the volatile products are driven off. The result is that the volatile elements burn at once. Even if this should not be the case the volatile products would have to pass through the fire zone, where they could not help being burned, in part to carbon dioxide, which would later be reduced to carbon monoxide.

### Functions of the Two Fire Chambers

In this system the vertical chamber serves the same function as in an ordinary up-draft system, but the fuel in this case is fed through the hopper on top of the angle chamber. This obviates the difficulty (experienced with ordinary up draft producers when adding fuel while running) of the tarry material getting into the gas stream and clogging up engine parts.

For the removal of the ashes there is a grate swung on trunnions, which is operated by a vertical lever at the side. By shaking the grate the ash is transferred to the saucer-shaped ash container at the bottom. At the center of this ash container there is a small hinged door through which the ashes can be dropped out at the end of a day's run. By operating the vertical handle on the grate to and fro through a sufficient angle, the bed of fuel can be consolidated at intervals.

The Stewart gas producer, of the semi-down-draft type, for motor truck application

### Arrangement of Evaporator

At the top of the vertical chamber there is an evaporator in which the water is maintained at a depth of  $1\frac{1}{2}$  in. This evaporator has a sheet copper cover to which the angle fittings for the air inlet and outlet are brazed. Within the air outlet pipe close to the cover is fitted a small throttle valve which is closed during the fanning operation. The gas outlet from the up-draft chamber is arranged centrally. When the producer is started up from cold, fuel can be fed through this gas outlet. There is a three-way valve on the gas outlet and the gas can either be passed to the engine or allowed to escape to the atmosphere. The feed of water to the evaporator is regulated by means of a float valve. Jolting of the vehicle is said to have no influence on the level of the water in the vaporizer. With a constant water level in the evaporator the air passing through will absorb a constant proportion of steam. It has been found, however, that the amount of moisture originally provided for was not sufficient for best results, and provision is now made for an additional drip feed on the air pipe.

The head of the angle chamber is a water-jacketed casting and is extended to form a water preheater, water being fed from this preheater to the evaporator and to the drip feed on the air pipe. This chamber is provided with a sliding grate which pushes the fuel in as required, and by its withdrawal permits additional fuel to fall in, there being a projecting wing which laps the port hole in its forward position. The sliding grate is operated by a worm and wheel carried by the cover of the angle chamber.

All of the producer systems here described are designed for use of only hard coal or coke. Soft coal is generally cheaper and more easily obtained in most localities, but the large proportion of tarry products render it unsuitable for use in automotive gas producers where the weight, space and complication of adequate cleaning apparatus present problems which are not easily solved.

# Gearing Calculations by the Compressive Stress Method

## Part I

The capacity of gears cannot be accurately determined by the bending stress method for bending stresses are not a true measure of wearing qualities. The maximum surface pressure, or compressive stress, must be considered if rate of wear of tooth is to be kept within proper limits.

By Joseph Jandasek\*

**W**ITH the exception of the engine, the gears are the most important part of an automotive vehicle. Designing gears so that they can be economically manufactured and at the same time will withstand long-continued wear is by no means a simple problem, and the designer seldom obtains the results he desires on his first attempt.

To determine the capacity of gears on the basis of bending stresses is more or less guesswork, because the bending stresses are only only an approximate and not a rational measure of wear resistance. In some cases, such as that of helical gearing, this method cannot be used at all. By the bending stress method the resistance of gears to fracture can be calculated; the compressive stress method, on the contrary, permits of determining the capacity of gears from the standpoint of wear; it is accurate and can be applied to any type of gear, because the radii of tooth curvature are always known.

Referring to Fig. 1, a gear can be made either of small width and cut with coarse pitch teeth, or of great width and cut with the finer pitch teeth, the diameter being maintained constant and the bending stresses remaining practically the same. We know, however, that a narrow gear will not stand up to heavy work. It has been proved in practice that in the case of helical spur gears considerations of wear so much outweigh those of mere breaking strength that a gear which is designed to give reasonably long service will carry anywhere from 10 to 20 times the working load without fracture.

In addition to the quality of material and the friction coefficient, the number of teeth and the tooth action are very important factors. The proportion of rolling to sliding motion and the proportions of tooth elements, such as the addenda of the gear and the pinion, also have great influence on the life of the gears; however, in the following discussion the writer will assume that the addenda

and the ratio of rolling to sliding motion have optimum values.

In the case of motor vehicle rear axles, especially those of trucks and tractors, where heavy tangential forces are being transmitted most of the time, the necessary size of

Fig. 2 — Relation between carbon content and tensile strength in steels

Fig. 3 — Relation between scleroscope hardness and tensile strength in steels

the gears must be determined by a method which gives assurance that the tooth faces will withstand the abrading action due to the rolling and sliding motion for a sufficient length of time. This wearing quality depends on the maximum tooth face pressure; assuming that the quality of material, toughness, proportion of rolling to sliding motion, friction coefficient and tooth action are the same. The allowable tooth face pressure depends, in turn, on the ultimate strength of material, which strength finally bears a definite proportion to the hardness. The designer, therefore, always specifies the hardness number in order to obtain the desired resistance to wear.

That certain materials do not wear away quickly is due to two conditions:

- (a) particles on the surface are not readily displaced;
- (b) particles, though displaced, are not readily removed.

Both these conditions must be present; either one alone is not sufficient. Substances which are really hard do not permit of their particles being readily displaced—hence they wear well. Plastic metals do not permit of their displaced particles being readily removed—hence they, too, may give good wearing surfaces though they are soft and compressed above the ultimate compressive strength. We find a good example in manganese steel, whose good wearing quality appears to be due to the following two

Fig. 1—Teeth of equal strength according to the bending stress method of calculation

\*Engineer, Republic Motor Truck Co., Inc.

causes: (1) the relatively high natural hardness (though less than that of hardened steel); (2) surface particles which are displaced are not ground to powder, the surfaces being merely plastically deformed. Thus the particles are capable of being displaced repeatedly before being ultimately lost. This is the author's explanation of why the gear face does not necessarily show wear even if the surface pressure (in case of shock) sometimes exceeds the ultimate strength of the metal. The particles then are only displaced, but not worn off. The area and depth of metal subjected to this overstrain are exceedingly small. A similar case occurs in ball bearings, where the compressive stresses often are beyond the elastic limit of the material, yet the bearings wear well, because this overstrain is confined to an extremely small surface and a small depth; moreover, the over-compressed material is supported from all sides by surrounding material.

This relation of hardness (in combination with toughness of material) to wearing quality explains the great success of casehardened gears. They possess a very hard and strong case, but contain a soft core of comparatively lower strength. The percentage of carbon contained in the casehardened surface should not be too great, however. A case containing 1.1 per cent of carbon gives a very hard wearing surface suitable for shafts, for instance. For gears which must withstand repeated shocks, this amount of carbon would render them too brittle, and it is advisable not to go higher than 0.90 per cent.

To illustrate the influence of carbon content on the ultimate strength the author has drawn the chart Fig. 2. It shows that the ultimate tensile strength of 0.90 per cent carbon steel, properly heat treated, is about 175,000 lb. per sq. in., while that of nickel-chromium and chromium-vanadium steel is up around 300,000 lb. per sq. in. Fig. 3 shows the influence of carbon content and hardness on the ultimate strength. It is to be noted that Brinell readings taken on casehardened surfaces are not dependable, owing to the soft core under the case, and it is advisable to use the scleroscope reading.

Now, the designer in calculating the bending stresses takes into consideration only the low carbon core, hence the design is sure to provide ample strength, because the case, which is under very high compressive stresses, is also much stronger than the core. The case is similar with cast iron, which possesses only moderate tensile

Fig. 4—Curve of compressive pressures at contact between two cylinders pressed together

Fig. 17—Showing how wear changes the involute tooth outline to a cycloidal outline

breaking strength (about 40,000 lb. per sq. in.), but a much higher compressive strength (around 110,000 lb. per sq. in.).

Soft steel gears, though the material possesses fairly high tensile strength, are not successful, because their tooth faces wear out in a short time.

The size of gears should be determined from the stresses on the working and wearing surfaces, i. e., the tooth faces. A strong pitch does not help any if the tooth wears out its face. It is the tooth contact surface,

determined by the curvatures of the gear and pinion, and the face of the gears, over which the load is distributed, and the pitch should be made only sufficient to resist fracture. Any larger pitch than that is uneconomical, as there is no gain in power transmitting capacity. Regarding this influence of coarse pitch, it may be said that the deeper case hardening of coarser pitch gears slightly increases the power transmitting capacity of the gears, but this depth can vary only within narrow limits (the writer uses 1/32 in. depth of case for 6 pitch gears, 3/64 in. depth for 4 pitch gears and 1/16 in. depth for 3 pitch gears). Thus the influence of pitch is only small and beyond calculation, at least within limits of gear sizes used on automotive vehicles. It has been the writer's experience that there is no intermediate range of life; the case on the gear teeth either stands up well and the gears are long-lived, or the surfaces wear out quickly and the gears are unsatisfactory.

Thus it is not the amount of wear in a definite time, but the maximum surface pressure which we want to make the basis of our calculation. If we keep the compressive stresses below a certain value the gears will wear well, while if they are allowed to exceed this value the gears will wear out quickly.

Another example in support of this theory is furnished by tempered gears. When calculating same by the bending stress method we soon find that we must use lower bending stress than for casehardened gears, although we know that the tempered steel is considerably stronger than the soft core of the case hardened tooth (see Table II). Another light is thrown on this subject by the sketch Fig. 17. This shows how the involute tooth wears out and changes to cycloidal form simply because in cycloidal gearing the internal curve always contacts with the external one (whereas in involute gears the external curve contacts with an external one) thus securing better contact and producing lower surface stresses. This also explains why noiseless operation is obtained with involute gears only when the gears are newly cut. Even slight wear of the gear teeth causes them to lose their correct shape. Thus we reach the conclusion that it is not the bending stress in the tooth, but the compressive stress on the tooth face that determines the capacity of gears.

#### Influence of Speed on Strength of Gears

As regards the increment load due to minute accelerations and retardations of the applied tangential force, the writer assumes this to be proportional to the square of the velocity  $V$  and takes:

$$\text{Increment Load} = \left( \frac{V}{1000} \right)^2 \text{ lb. per lb. of } W_0 \text{ (steady load)}$$

Then the total instantaneous load  $W_i$  is

$$W_i = W_0 \left[ 1 + \left( \frac{V}{1000} \right)^2 \right] \text{ lb.} \dots\dots\dots (1)$$

Figs. 5 to 12—Showing how acceleration and retardation of driven gears are caused by irregularity in the shape of the gear

Fig. 5—Rolling action diagram of an absolutely accurate pair of gears made of rigid material

Figs. 6 and 7—Gears made with same cutter on good and badly worn machine respectively

Figs. 8 and 9—Records of gears cut in the same machine with accurate and inaccurate cutters respectively. Fig. 10—Heat-treated gears

Fig. 11—Noisy gears. Fig. 12—Noisy gears inaccurately mounted

(for accurate teeth, high grade workmanship and good material).

This increment load is an instantaneous pressure created by

(1) accelerations and retardations of the applied load and gear mass due to (a) irregularity of tooth outline, (b) variable gear tooth and its surface deflection, (c) wear of teeth;

(2) any acceleration, retardation, deflection and shock resulting in oscillations which at high speed may interfere and may cause the original load to be multiplied several times.

Although no correct equation for the calculation of the influence of speed is known, the writer is inclined to compute the instantaneous load by equation (1) rather than by Barth's addition  $\left(1 + \frac{V}{600}\right)$  for the following reasons:

(a) It can be proved mathematically that the increment load due to irregularity of motion must be proportional to the square of the pitch velocity and cannot be directly proportional to it. No gears are safe at extremely high speeds, hence the increment load must increase faster than the velocity.

(b) The mass or weight of gears subject to acceleration and oscillation increases with the transmitted load  $W_0$ ; the greater the tangential force the heavier the gears required for its transmission.

(c) Finally, the deflection also increases with the load. The quantities which are uncertain are the error in pitch line velocity and magnification of same by oscillation and deflection. These factors must be estimated from experiments and from the results of practice. It would be best to use different allowable stresses  $C$  or  $S$  for each particular speed, which stresses have been proved safe by actual service.

One of the most important and difficult problems in the production of automotive gears in large quantities is to obtain the high degree of accuracy required. A minute departure of the cutter from the theoretical profile, slight wear or an error of setting in the gear cutting machine results in inaccuracy of the theoretical tooth outline. It is therefore important to know not only how much the actual shape of the gear departs from the theoretical one, but also to find out the causes of these errors so they can be remedied, and breakage or extreme wear of the teeth prevented.

The author has prepared a few diagrams to show how acceleration and retardation of the driven gear are caused

by irregularity in the shape of the gear. Fig. 5 (arc of a circle) is a purely theoretical diagram corresponding to an absolutely correct pair of gears. Fig. 6 is a record of another pair of gears produced by a cutter of average accuracy on a machine of the same quality. Fig. 7 represents a record of a pair of gears from the same cutter as used for the gears of Fig. 6, but cut on a worn-out machine. In this way the accuracy of the machine can be tested. Figs. 8 and 9 have been prepared to demonstrate the accuracy of cutters. Both pairs of gears were cut on the same accurate machine, but with different cutters. Fig. 9 illustrates plainly that the shape of cutter was not correct. Fig. 10 illustrates the effect of hardening on the shape of gear teeth; the sharp irregularities are the result of warpage during heat treatment, and in this way badly warped gears can be easily detected. Figs. 11 and 12 are records of two pairs of noisy gears.

The above diagrams show plainly that even accurately manufactured gears possess irregularities in action, causing accelerations and retardations of the driven gear; these accelerations result in noise at high speeds and eventually breakage of the gears at some still higher speed.

Fig. 13 shows how the speed affects the allowable bending stresses according to text books on gearing. This comparison has to be taken as rather of a qualitative than quantitative character; that is, the reader's attention should be directed to the slope of the curves at different speeds. Curve A is a plot of the working stress (bending stress) for cast iron in the Lewis formula (see also Table I). Curve B represents working stresses for steel in the same formula. Curve C shows allowable unit stresses in carbon steel or low carbon alloy steel, casehardened, to be used for motor truck change gears, as given in P. M. Heldt's "The Gasoline Automobile." Curve D represents allowable unit stresses in alloy steel gears, casehardened, when used for passenger car change speed gears, given also in the above mentioned book. In Curve E are shown allowable unit stresses in chrome nickel and chrome vanadium steel gears, hardened all through, as given by the same author. Curves F and G give working stresses calculated from equation (1):

$$\text{instantaneous stress } S_t = S_c / \left[ 1 + \left( \frac{V}{1000} \right)^2 \right]$$

when  $S = 40,000$  lb. per sq. in. and 25,000 lb. per sq. in. respectively. Finally, curve K represents the safe shear-

Fig. 13 (Above)—Variation of permissible bending stress in teeth with pitch circle speed according to different authorities

Fig. 14 (Below)—Variation of instantaneous load with pitch line velocity according to various formula

ing stress in lb. per sq. in. for herringbone gears of high carbon forged steel (see also Table III) as used in the equation for the capacity of this type of gearing.

$$W = 0.4 p f k \dots \dots \dots (2)$$

Fig. 14 represents the two equations for increment load. Curve A gives the instantaneous load according to Barth's equation:

$$W_i = W_b \left( 1 + \frac{V}{600} \right) \dots \dots \dots (3)$$

This formula is suitable only for cast and inaccurately cut gears and low speeds. Curve B represents the instantaneous load according to equation (1). Curve C shows the instantaneous load for herringbone gears for high carbon steel. The slow increase of the increment load brings out clearly the advantage of helically cut gears.

#### Capacity of Spur Gears

Starting from the theory of pressure between elastic bodies with curved surfaces we can calculate the load capacity of straight spur gears according to the general equation:

$$W_o = \frac{\sin 2\theta}{0.7} \left[ \frac{1}{e} + \frac{1}{E} \right] \frac{C^2 f r}{1 + \frac{r}{R}} \text{ lb. per sq. in.} \dots \dots \dots (4)$$

(This equation differs slightly from the one derived on page 1405 of AUTOMOTIVE INDUSTRIES for June 17, 1920.) In this equation

$W_o$  = maximum safe tangential force as regards the

pinion is usually made of better steel ( $3\frac{1}{2}$  per cent nickel as compared with carbon steel for the gear).

Inserting the modulus of elasticity  $E$ , whose average value may be taken at  $30 \times 10^6$  lb. per sq. in., in equation (4) we obtain for straight spur gears, steel on steel, with a pressure angle  $\theta = 20$  deg. the capacity:

$$W_o = \frac{C^2}{16.3 \times 10^6} \frac{f r}{1 + \frac{r}{R}} \dots \dots \dots (5)$$

We have, further,

$$2\pi r = np \quad \text{and} \quad \frac{r}{R} = a,$$

hence we get for the capacity,

$$W_o = 10^{-8} C^2 p f \frac{n}{1+a} \text{ lbs. per sq. in.} \dots \dots \dots (6)$$

(for steel spur gears with a pressure angle of 20 deg.), where  $n$  = number of teeth in pinion.

$p$  = circular pitch in inches.

The value of the gear ratio  $a = r/R$  must be added for external and subtracted for internal gears.

From this equation the reader can readily see that the capacity of a pinion depends not only on its own dimensions, but also on those of its mating gear. The case is similar to that of ball bearings whose capacity depends not only on the ball diameter, but also on the size and shape of the races.

TABLE III  
SAFE SHEARING STRESS K FOR HERRINGBONE GEARS

Gear Material	100	200	300	400	500	Velocity In Feet Per Minute	600	800	1000	1200	1500	1800	2100	2400	3000
Brass	600	575	550	525	500	475	425	400	380	360	350	340	325	300	300
Cast Iron	800	750	700	675	650	625	575	525	500	475	450	425	400	375	375
Gun Metal	1000	950	900	850	830	800	750	700	650	600	550	525	500	475	475
Phosphor Bronze	1150	1100	1050	1030	1000	975	925	875	825	775	725	675	650	600	600
Steel Castings	1325	1275	1250	1200	1175	1150	1100	1050	1000	925	875	825	775	700	700
High Carbon Steel Forgings	1800	1750	1700	1650	1630	1600	1550	1500	1450	1350	1275	1200	1125	1050	1050

compressive stress at the pitch diameter, assuming that only one pair of teeth is in mesh at a time:

$\theta$  = pressure angle in degrees.

$e$  and  $E$  = moduli of elasticity of materials in contact: lb. per sq. in.

$C$  = maximum allowable compressive stress on the tooth face at the pitch line in lb. per sq. in. for each particular speed  $V$ .

(In Fig. 4 is shown the distribution of pressure between two cylinders. It is the very maximum and not the average pressure which we are dealing with.)

$f$  = face of gears in contact in in.

$r$  = pitch radius of pinion in in.,  $R$  = pitch radius of gear in in.

$V$  = circumferential speed at the pitch line in ft. per min.

Although the compressive stress  $C$  is the same for the gear as for the pinion, still the pinion will wear more rapidly, provided hardness and toughness are the same, because the teeth of the pinion come into action more frequently. Also, if there occurs any overstrain due to shocks more metal is deformed on the pinion than on the gear, owing to the smaller radius of tooth curvature. However, it is desirable that pinion and gear should wear equally long, so as to avoid the necessity of engaging a new pinion with a partly worn gear, thereby decreasing the life of both. Consequently, to secure equal wear in a pair of unequal gears the pinion should be made harder (from 5 to 10 points scleroscope) than the gear. This applies, in the case of internal gear-driven axles, to the bevel gears, and in the case of double reduction axles to the bevels and spurs. In the case of internal gears the

On the basis of bending stresses the strength of spur gears,

$$W_b = Spfy \text{ lbs. per sq. in.} \dots \dots \dots (7)$$

The strength of a pinion calculated on the basis of bending stresses depends on its own dimensions only and remains the same whether a pinion meshes with a spur gear, a rack or an internal gear of any size.

To simplify matters we may take for the tooth form factor for the Fellows stub tooth system the value

$$y_s = 1.25 \left[ 0.154 - \frac{0.912}{n} \right] \dots \dots \dots (8)$$

(To be continued)

WITH a view of proving that the metal can be safely employed for many purposes which appeared at one time beyond its scope the French Société d'Encouragement recently organized an "aluminum week," during which an exhibition was held at the society's headquarters in the Rue de Rennes, Paris, accompanied by conferences dealing with the various applications of the metal. The exhibition itself covered almost every application, and particularly interesting were aluminum castings of so complicated a character that it would be difficult to obtain equally good results with other metals. So much progress has been made with the welding of aluminum and the production of alloys that it is now capable of being employed for almost every purpose, even where it is subjected to heavy stresses, and the addresses delivered by L. Guillet and others aimed at showing that aluminum has a vast field of utility in electrical engineering as well as in the aviation, motor car and other industries.

# The Influence of Various Fuels on Engine Performance

## Part VII

In this, the concluding article of this series, the author describes the variable compression and other engines employed in conducting the tests and the considerations on which the design of some of these was based. The testing apparatus used is also described and illustrated.

By H. R. Ricardo\*.

IT is well to point out that in the results of tests reported in foregoing instalments of this article in all cases where a result was obtained which did not at first sight appear to fall into line with the deductions formed at the time, check tests were taken progressively throughout the whole series of variables until the particular one had been traced whose influence was exerting itself. Except in a few instances where samples were very difficult to obtain, and only very small quantities were available, all the results quoted in the previous articles were checked again and again, and no figures have been published which have not been checked and repeated to within  $\pm 0.5$  per cent at least two or three times. In order that the reader may have the opportunity to judge for himself as to the accuracy of the readings obtained, and to draw his own conclusions as to the nature and possible influence of such disturbing factors as may remain, and which might affect the

\*From a preliminary report (slightly condensed) on research work conducted by the author for the Asiatic Petroleum Co. and published in the *Automobile Engineer*.

results, it will be well to describe in some detail the apparatus used.

In Figs. 27 and 28 are shown a drawing and a photograph of the variable compression engine. In the design of this engine the following considerations were taken into account.

(1) In view of the prolonged and extensive nature of the tests, not only were durability and reliability regarded as matters of primary importance, but every effort was made to insure mechanical consistency.

(2) Every known expedient was adopted to attain the highest possible thermal efficiency and power output and to insure that all losses, whether thermal or frictional, were reduced to the absolute minimum, and maintained as nearly constant as possible under all conditions.

(3) The engine was designed to run when required at a piston speed in excess of that of existing engines.

(4) Means were provided for varying the compression of the engine over any range from 3.7:1 up to 8:1 while running at full power, and without disturbing any temperature, frictional, mechanical, or other conditions.

(5) The combustion chamber was so designed that its general form and ratio of surface to volume undergo the minimum of alteration when the compression is varied.

(6) Special means were adopted to render the engine as little sensitive to changes in the temperature of the lubricant as possible. Ball bearings are used wherever possible, in order to reduce variation in friction with different oil temperatures, and the water jacketing round the barrel of the cylinder is stagnant, and therefore quickly attains a constant temperature, independent of the temperature of the supply. This insures that the piston friction which is dependent upon the temperature of the oil on the cylinder walls reaches a minimum in the course of a few minutes, and thereafter remains constant. The importance of retaining the same general form of combustion chamber under all conditions of compression cannot be over-estimated. Very misleading results have been obtained when the compression ratio has been varied by fitting different pistons, some with concave, others with convex crowns. In one series of experiments with different compression ratios which the writer examined, and which were obviously carried out with the most scrupulous care, the results were entirely vitiated because the whole character and efficiency of the combustion chamber was completely changed, as between the low compression and the high, with the result that a certain optimum compression ratio was claimed to have been found, after which any further increase in com-

Fig 27—Sectional views of the variable compression engine

pression resulted in loss of power and efficiency. A careful scrutiny of the results showed that at or near the so-called optimum compression ratio the efficiency of the combustion chamber was at a maximum, and that at the higher compressions it fell away very rapidly, and, indeed, became quite exceptionally inefficient.

In the variable compression engine designed for the purpose of these tests the efficiency of the combustion chamber undergoes very little change between the lowest compression ratio and the highest, with the result that the efficiency increases with increase of compression at a perfectly normal rate throughout the whole range.

As will be seen from the sectional drawings, Fig. 27, the compression ratio is varied by raising or lowering the whole cylinder, together with the carbureter, camshaft, and valve gear; by this means the compression ratio can be varied over any range in the course of a few seconds, and without disturbing any of the temperature conditions or any adjustments.

To measure and record the compression ratio in use a micrometer is provided. This is arranged to operate electrical contacts, and controls a pilot lamp which lights up immediately the desired compression is reached, so that the operator can adjust the micrometer screw at his leisure to the compression ratio he requires before making any alteration, and can then see at a glance by the lighting up of the lamp that this compression has been reached.

For the ignition of the charge four spark plugs are fitted equidistant round the circumference of the combustion chamber, each of which is connected to a Remy high tension coil. The low-tension circuit of all the coils is operated by a single Remy contact breaker driven directly from one end of the camshaft. The object of using this arrangement in preference to magnetos was twofold:—

- (1) To insure that the passage of the spark across all four plugs should be absolutely synchronous.
- (2) To insure that the intensity of the spark should be the same at all settings.

In practice it was found that the use of two sparking plugs on opposite sides of the combustion space gave equally good results, and all tests were therefore run under these conditions. To measure accurately both the power and friction losses the engine is direct coupled to a balanced swinging field electric dynamometer, one arm of which carries a dead weight of 40 lb., which is slightly in excess of the maximum torque of the engine—a light open-scale spring balance is used to record the difference in torque between the dead weight and that developed by the engine—this arrangement permits of exceedingly accurate determinations, since a very small variation in torque corresponds with a wide range on the spring balance. The mean torque on the dynamometer arm is in the neighborhood of 35 lb., and the difference can be read off at a glance to within less than one-tenth of a pound. The steadiness of the dynamometer is such that the needle of the spring balance does not vibrate or oscillate through a range of more than  $\pm 0.1$  lb. Generally speaking, all readings of torque can be taken as being accurate to within one-third of one per cent., while the standard of accuracy of the average of several readings is, of course, considerably higher. The load is controlled by varying the field excitation of the dynamometer. For this purpose, two rheostats are provided in the field circuit, one of which gives coarse graduations, and the other, a continuous coil resistance, affords continuous range, and is used for fine adjustments.

The fuel-measuring device consists of two vessels, each consisting of two conical ended chambers connected together at either end by a narrow throat as shown in the general layout of the testing apparatus, Fig. 29. The upper chamber has a capacity of exactly one pint, and the lower of  $\frac{1}{4}$  pint. A gage glass is fitted to each vessel. The

Fig. 28—Variable compression engine showing the micrometer for adjustment of the cylinder to various compression ratios

rate of fall of liquid in the glass is very rapid when passing the narrow throats, so that its passage past the marks can be timed with extreme accuracy. Geared off one end of the camshaft is a revolution counter operated by means of a magnetic clutch, and so arranged that the counter is thrown into operation as the liquid in the gage glass passes the first mark, and is thrown out, and a brake applied to its spindle as the liquid passes the second mark; thus the actual number of revolutions during the consumption of either one pint or one quarter pint of fuel is automatically recorded.

The carbureter is a standard Claudel-Hobson aircraft type, but fitted with a fine adjustment needle valve controlling the jet so that the mixture can be varied between close limits. An electrical heater is fitted in the carbureter air intake passage, and the exact amount of heat supplied can be read off from instruments on the switch-board. A thermometer fitted in an insulated pocket, and projecting into the inlet valve port, is provided to record very approximately the temperature of the working fluid during its entry to the cylinder. From the known amount of heat supplied, and from the measured difference in the temperature of the air before and after its entry to the carbureter, it is possible to determine at least a relative measure of the mean volatility of the fuel used. As has been explained previously, the readings of the thermometer in the induction passage are of relative value only. Owing to the variations in the temperature of the thermometer pocket due to the deposition of liquid fuel upon it this thermometer behaves as a wet bulb instrument, and even the relative values of its readings cannot be relied upon as between fuels of widely different latent heats of evaporation.

From the above details it will be seen that the standard of accuracy obtainable with this particular piece of appa-

Fig. 29—General (diagrammatic) layout of the testing apparatus

ratus is exceedingly high; its mechanical consistency is exemplified by the fact that many check tests of power and consumption taken on certain fuels, sometimes after a lapse of many months, show extreme variations of less than 0.5 per cent.

This particular engine has been in almost continuous operation for 20 months, running on the average some 10 to 15 hours per week, about 90 per cent of the running being with wide open throttle, and at an average piston speed of 2000 ft. per minute.

### Supercharging Engine

The supercharging engine used in these experiments has also been fully described in a paper read before the Institution of Automobile Engineers, and published just recently in these columns. A brief description of its operation will therefore suffice.

For the purpose of these tests it was employed almost solely for investigating the tendency of fuels to detonate, and in order to make the detonation as severe as possible, a somewhat higher compression ratio was used than formerly, and at the same time the exhaust valve was arranged to open earlier in order to reduce to the minimum the proportion of cooled exhaust gas in the scavenge and supercharge air. From the point of view of investigating detonation it was found to be more sensitive than the variable compression engine, also very accurate readings could be taken in a remarkably short space of time—an important consideration in all experimental work, more especially when dealing with samples of which the quantity was very limited, as was the case with many of the "pure" samples.

This engine has a cylinder of  $4\frac{3}{8}$ -in. bore and  $5\frac{1}{2}$ -in. stroke, and was intended to run normally at a speed of 1500 r.p.m., at which speed all tests for detonation were carried out. The valves are arranged with the inlet directly over the exhaust, both valves being in a side pocket. It is fitted with a crosshead type piston, and for the purposes of these experiments with a fixed compression ratio of 5.18:1.

Supercharging is effected in the following manner:—Advantage is taken of the differential area of the piston and crosshead to pump air, which is drawn into a chamber below the piston through a series of very light bronze flap valves; the air thus entrapped is compressed by the piston to a pressure of about 10 lb. per sq. in., and then delivered through a water-cooled intercooler to the cylinder. The lower end of the cylinder barrel is perforated with a num-

ber of small ports just uncovered by the piston at the bottom of its stroke. The cycle of operations beginning with the induction stroke, is as follows:—

As the piston descends a mixture of fuel and air enters the cylinder through the inlet valve in the usual manner, and at the same time the air in the chamber below the piston is compressed. At about 95 per cent of the downward stroke the ports referred to previously are uncovered by the piston and the air in the crosshead chamber enters the cylinder, after passing on its way through the water-cooled intercooler which removes from it a large proportion of the heat of compression and also of the heat picked up from contact with the underside of the piston. About the same time the main inlet valve to the cylinder is closed and the pressure in the cylinder rises, due to the addition of the supercharge air, from slightly below atmospheric pressure to 5 lb. per sq. in.

above. The additional air entering in this manner does not mix freely with the fuel and air in the cylinder, but forms more or less a layer over the crown of the piston. On the following upward stroke the contents of the cylinder are compressed, and at the same time a fresh supply of air is drawn into the crosshead chamber below the piston. During compression very little mixture between the live charge and the supercharge takes place. On ignition the inflammation of the first portion of the charge causes a local and rapid rise of pressure, and so sets up a fresh disturbance which causes complete or nearly complete admixture of the cylinder contents, but not until the first portion is fully ignited. During the expansion stroke the second charge of air drawn into the crosshead chamber is compressed. Toward the end of this stroke the exhaust valve opens and the bulk of the products of combustion are discharged. Shortly after the opening of the exhaust valve the ports in the cylinder wall are again uncovered by the piston, a second charge of cool compressed air then enters the cylinder, driving before it some of the remaining products of combustion. During the following upward stroke of the piston the contents of the cylinder are discharged through the exhaust valve, leaving only the compression space full of a mixture of exhaust products and air. At the same time a fresh charge of air is drawn into the crosshead chamber in readiness for the supercharge.

From the above brief description it will be seen that the cylinder is alternately scavenged and supercharged by means of the air compressed below the working piston. The additional air provided in this manner per cycle is probably about 40 per cent. The supercharge air can be measured with a fair degree of accuracy and amounts to from 34 to 35 per cent of the total cylinder volume; the amount added due to the scavenging cannot so readily be assessed, but is probably in the neighborhood of 5 per cent.

For controlling or cutting off the supercharge a movable shutter is provided, surrounding the ports in the cylinder wall in such a manner that they can be partially or completely closed. In the latter event the engine runs in every respect as a normal four-cycle engine, and the air in the crosshead chamber is alternately compressed and expanded. The shutter is so arranged that the supercharge can be introduced or cut off instantaneously. In so far as the testing gear is concerned the arrangements are almost precisely similar to those described previously in relation to the variable compression engine, except that the car-

bureter heating is effected by means of a hand-controlled exhaust jacket and there is no magnetically operated revolution recorder. Since, however, the supercharging engine has been employed almost exclusively for investigating the problems relating to detonation these refinements have not been found necessary. In an engine running on this cycle with an excess of air always present in the cylinder the mean effective pressure varies directly as the quantity of fuel admitted up to the point at which the whole of the supercharge air is saturated; moreover, maximum efficiency is maintained over a very wide range of mean pressure. In this respect, therefore, the supercharging engine showed a very marked advantage over the variable compression unit in which the mixture strength for maximum efficiency at each compression ratio had to be searched for in every instance. By increasing the quantity of fuel admitted the mean effective pressure could be raised in direct proportion until a point was suddenly reached at which violent detonation was set up. In the case of every fuel tested which came within the range of this engine, the mean pressure at which detonation suddenly occurred was not only very sharply defined (to within less than 1 lb. per sq. in.), but it was also found to be quite extraordinarily consistent.

This engine was constructed some six years ago for a totally different purpose, but it has proved invaluable for fuel research, and in spite of its age and the very rough usage to which continued detonation experiments must subject any engine it stood up to its work remarkably well for a period of eighteen months. It has not quite so high a standard of mechanical consistency as the variable compression engine, and is rather more sensitive to variations in oil temperature, etc., but, none the less, its performance has varied by less than 1.5 per cent at any time over a period of eighteen months' hard usage.

### Miscellaneous Engines

Apart from the special research engines, samples of many of the fuels were tested in other engines on the test beds. These consisted of two or three experimental engines of various types, permanently fitted up on test beds for general research work and other more or less representative engines built by various makers, undergoing investigation of one sort or another. All these engines, whether permanent or temporary, were direct coupled to swinging field electric dynamometers and fitted with means for recording both the power and economy with a very high degree of accuracy. From a general scientific standpoint the results obtained from a large number of engines of widely different types and sizes proved extraordinarily interesting, but in so far as the fuel problem was concerned they yielded little or no information which could not be obtained more readily and more accurately on the special research engines. Each engine, of course, had its own particular characteristics depending upon the details of its design—in some the distribution was good, in others bad, some had efficient combustion chambers, others the reverse, some detonated even with a very low compression, while others would stand a high compression without trace of detonation on the same fuel. Some had insufficient heating to the carbureters, others excessive. As a result of these individual characteristics, each engine behaved differently, but all of them behaved perfectly rationally, and, once their idiosyncrasies were recognized and allowed for, the results obtained with each sample of fuel could be predicted to within very close limits from the experiments on the research engines. No single case occurred where the behavior of a fuel differed as between that in one of the research engines or any other engine, when the characteristics of the latter were taken into proper consideration.

The experiments, however, on miscellaneous engines were not without value, for they indicated that the results obtained in the special research engines could be relied upon as being applicable to any other type, provided the varying conditions were taken into account, while they afforded generally a useful check. The experiments on standard engines, however, would have been of little or no value by themselves unless run in parallel with those on the special research engines. Without the latter they would have proved misleading in many instances. For example, before any accurate deductions could be drawn as to the behavior of any particular fuel, it was found absolutely essential to determine definitely and accurately the rate of heat input to the carbureter, for upon this depends not only the degree of volatilization, but also the volumetric efficiency, and, therefore, the power output, and also to a considerable extent the tendency of the fuel to detonate. In all ordinary engines the carbureter and induction system receives heat either from the water circulation or from the exhaust pipe. In neither case is it possible either to determine the amount of heat so received or even to keep the amount constant, for readings of temperature either of the gas in the induction pipe or in the carbureter proved utterly unreliable, and were of value only when the rate of heat input also was definitely known. It has been shown previously that the rate of heat input to the carbureter, as opposed to the temperature of the gases, proved to be, in fact, one of the most important of all the controlling factors in the behavior of a fuel.

The variation in the tendency to detonate as between different forms of combustion chamber was especially marked. In the case of gasoline "A," for example, this detonated in the variable compression engine at a compression ratio of 6:1. In the case of several of the other engines it detonated at ratios below 5:1, and in one extreme instance of bad combustion chamber design it actually detonated with a compression ratio of only 4.3:1. This particular engine could not run on any ordinary gasoline on full load without the use of an overrich mixture, and/or a very late ignition timing, so that its fuel consumption on most grades of gasoline was abnormally high, and it could only be run at a reasonable economy on gasolines "A" and "H."

### Substitutes for Engine Bearing Metals

THE aircraft experimental station at Vienna, after extensive tests with a 100-hp. Mercedes airplane engine, stated that aluminum and zinc alloys are not suitable for engine bearings. However, alloys with 13-69.2 per cent of lead, 68.0-7.4 per cent of tin, 13-15.4 per cent of antimony and 6-8 per cent of copper proved satisfactory in endurance tests.

An interesting metallurgical process is covered by German patent No. 317-087. Cleaned wrought iron parts are covered with thin plates of gray cast iron or sprinkled with turnings of gray cast iron and then the thin layer of cast iron is melted down at white heat with the aid of a flux. The wrought iron at this high temperature absorbs some of the carbon of the cast iron surface layer and thus a steel coating is formed.

For engine crankshafts the following alloy steel is recommended by *Stahl und Eisen*:

Carbon, 0.2-0.45 per cent, or 0.2-0.4 per cent.

Manganese, 0.4-0.6 per cent, or 1.5-1.8 per cent.

Silicon, 0.2-0.3 per cent.

Chromium, 1.0-1.3 per cent.

According to carbon content and heat treatment, these steels show an elastic limit of 85,000-142,000 lb. per square inch and have a fibrous fracture.

# A Laboratory for Aircraft Engine Testing

Facilities for tests of both water-cooled and air-cooled engines are fully described. Wind tunnel used for testing engine under conditions approximating those of actual flight is of particular interest.

By Herbert Chase

**A**MONG the best equipped laboratories in the country for aircraft engine testing is that of the Wright Aeronautical Corp., whose plant is devoted exclusively to the manufacture of high-grade aircraft engines. This plant is of thoroughly modern construction, and a considerable portion of one of the four floors of the building is given over to the testing laboratory and a shop for experimental development work. The laboratory equipment is used for routine tests of all of the engines produced by the company, as well as for special research and development work.

The primary units of the equipment are three 400-hp. Sprague electric dynamometers mounted on 14-ft. cast-iron bed plates and equipped with Toledo springless scales for torque measurement. Adjacent to each dynamometer is the panel board with circuit breakers, switches and rheostat controls. Close to this and beside the torque scale is a second control board on which are mounted the spark and throttle levers, oil pressure gage, revolution counter and a magneto grounding switch. The throttle controls are connected to the engine through steel rods and bell cranks supported on brackets between the engine and the dynamometer.

The engine is connected to the dynamometer by means of a substantial fabric disk-type coupling illustrated in one of the cuts herewith. This coupling design was originally developed at McCook Field and is still in use

there. When in use it is incased by a guard of sheet metal.

The engine is supported on wooden bearers, which are, in turn, attached to conventional adjustable cast-iron supports bolted to the bed plate. Cooling water is supplied from one or both of two tanks located on an elevated stand slightly above the level of the top of the engine at one end of the laboratory. When engines are under test one of these tanks contains hot water and the other cool water at approximately air temperature. The temperature of the water entering the engine is controlled within the desired limits by valves conveniently arranged for this purpose. Water is discharged from the engine into the hot-water tank. The level in this tank is maintained by a motor-driven centrifugal pump controlled by a float switch. Water taken from the tank by this pump is delivered to spray heads located on the roof of the building, from which it returns by gravity to the cold-water tank and is recirculated through the engine.

Provisions for muffling the exhaust from the engines under test is important because of the fact that the plant is within a short distance of hospitals and dwelling houses. This is accomplished as follows: At each side of the engine base are two large exhaust headers with inlets opposite the individual exhaust pipes of the engine cylinders. Attached to each exhaust pipe is a flanged extension provided with a nipple through which water is fed to the interior of the pipe. These nipples are connected to a cold-water supply main and the water is mixed with the exhaust as the latter leaves the engine. The mixture of water, steam and exhaust gas enters the exhaust header through flexible hose connections and flows by gravity to a settling tank under the floor. In this tank the gas and water separate and the gas, with a certain amount of steam, escapes through a vent pipe carried several feet above the roof of the building. The water level in the exhaust water tank is also maintained by a motor-driven centrifugal pump controlled by a float switch. The pump delivers the water to a cooling tower on the roof, from which it is returned to the cold-water tank in the dynamometer room and used again. Addition of water to the exhaust cools it and causes it to contract. After flowing through the large pipes and the tank, which act as expansion chambers, the exhaust issues into the open air without appreciable noise, while the back pressure of the engine is only 3 in. of water.

The fuel used for all routine engine tests is a mixture containing 20 per cent benzol and 80 per cent aviation gasoline. This fuel is stored in a 20,000-gal. tank buried below ground. From this tank the fuel is pumped to a 30-gal. tank on the outside wall of the laboratory. Thence it passes by gravity through a large filter to small measuring tanks adjacent to each engine.

Sectional view of flexible coupling used between engine and dynamometer

Two views of the Wright Aeronautical Corporation's engine testing laboratory. Above—the wind tunnel used for tests or air cooled engines. Below—one of the testing stands for water cooled engines

Lubricating oil used in the engine is circulated through a copper coil submerged in a tank of water under the engine. The temperature of the water in this tank is controlled by admission of cold water from an external source.

In starting the engine or driving it by means of the dynamometer used as a motor it is necessary to have a supply of direct current, and the same is necessary to excite the fields of the dynamometers. This current is supplied from the generator of a large motor-generator set, the motor of which is driven by alternating current furnished by the local public service company. Should this external supply of current be shut off, as sometimes happens during a thunderstorm, load would instantly be removed from the dynamometer and the engine would race and probably destroy itself and the dynamometer. To prevent this a solenoid actuated by

the field current is so arranged as to short circuit the engine magnetos and thus stop the engine the instant the field circuit is broken. Provision is also made whereby the magnetos are also grounded, if for any reason the circuit breakers blow.

The electrical energy developed by the dynamometers is dissipated in resistance grids placed in a well-ventilated pent house on the roof above the laboratory.

A fourth dynamometer of 75-hp. capacity is used for tests of single-cylinder engines which it is the practice of the company to build and test before constructing engines of the multiple-cylinder type. This dynamometer is provided with auxiliary equipment similar to that used in connection with the larger machines.

One of the unusual features of the laboratory equipment is a wind tunnel designed primarily for tests of radial-cylinder, air-cooled engines, but applicable to

tests of any air-cooled engine. The tunnel is shown in one of the accompanying cuts. Air enters the tunnel through an opening in the wall of the laboratory and passes through a hopper-shaped duct into an elbow. Thence it enters the throat of the tunnel where the engine is placed and, after cooling, the engine is drawn into a large sirocco-type blower, from which it is exhausted through an opening in the roof of the laboratory. The blower is driven by chain from a 150-hp. motor, and is said to be capable of creating an air velocity of about 100 miles per hour past the engine, thus closely approximating flying conditions. The exhaust from the engine is carried out in the air stream.

The engine is completely inclosed during a test, but its performance can be observed through windows pro-

vided for the purpose. Electric lights are arranged in the tunnel so as to illuminate the parts of the engine which need to be watched. In the accompanying photograph a radial-cylinder engine is shown in place, a part of the casing of the tunnel having been removed. The engine is supported on a heavy angle iron frame designed for the purpose. Power output is measured by one of the same 400-hp. dynamometers used for tests of the Wright V-type, water-cooled product. The engine is connected to the dynamometer by a shaft several feet long and a fabric disk coupling. The shaft is supported in two bearings and passes through the wall of the elbow, which forms part of the tunnel, so that the dynamometer and all measuring apparatus are outside the tunnel, and are consequently not affected by the air stream.

## A Departure in Truck Muffler Design

**M**UFFLERS are necessary in automotive apparatus to reduce the noise of the engine exhaust and contribute to the comfort of both the passenger and the innocent bystander. Nevertheless, their use involves initial cost, weight to be carried about, and back pressure in the cylinders. They frequently clog up with carbon deposit and constitute an entirely unsuspected source of engine loss and heating, due to greatly increased back pressure. The "blowing up" of mufflers by muffler explosions is quite common and the muffler constitutes one of the many sources of rattle in the vehicle.

The relative importance of these various factors is not the same for all automotive uses, but no one of them is negligible for any one use. It must be conceded that repairs or replacement after blowing up of the muffler, or the necessity of cleaning out the carbon, or faulty performance due to unsuspected clogging of the muffler, constitute reasonable sources of future sales resistance in any vehicle, and should be avoided if possible.

The following table is possibly representative of the general opinion of automotive engineers regarding the relative importance of the various factors in each field:

### Passenger Cars

**High Priced**—Strength, noise, back pressure, cost, ease of cleaning, weight.

**Low Priced**—Cost, noise, back pressure, strength, weight, ease of cleaning.

### Trucks

**Heavy**—Back pressure, strength, ease of cleaning, noise, cost, weight.

**Light**—Cost, noise, strength, back pressure, weight, ease of cleaning.

**Aeronautic**—Strength, back pressure, weight, wind resistance, noise, cost.

Even after the back pressure has been so reduced as to have no serious effect upon engine power, there is still opportunity to reduce heating of the jacket water and perhaps increase the life of the exhaust valves by still lower back pressure.

In general, quietness and low back pressure are opposing factors, but each must measure up to accepted practice for any given use. Adding strength tends to increase cost and weight. Arrangements for ease of disassembling and cleaning tend to increase cost. Each muffler is an expression of the individual manufacturer's idea of the best that he can produce in the way of compromise among these various factors for any given use.

A radical departure in muffler design is about to be marketed, which is claimed to offer a better compromise for certain uses than seems possible with the conventional type, in that it is said to give a lower back pressure, to weigh less, to be entirely free from clogging troubles and practically indestructible under service conditions.

This muffler, known in aviation service as the Curtiss type, has recently been adapted to truck use and is being manufactured by the Powell Pressed Steel Company, under license from the Curtiss Engineering Corporation, and will be marketed as the "Kemble" Muffler.

In its simplest form, as applied to aeronautic work, the Kemble muffler consists of a conical shell with a narrow longitudinal slot which permits the exhaust gas to escape to the atmosphere as rapidly as the narrowing cross section of the cone tends to check the velocity and raise the pressure.

As adapted to truck use, a series of circular holes replaces the longitudinal slot, and a short inner cone is added. The muffling effect is obtained by dividing the total outlet opening into a multitude of much smaller openings, which give correspondingly smaller noises, occurring successively, and so by "stringing out" the exhaust, soften it in much the same fashion as by a continuous longitudinal slot.

The low back pressure and immunity from blowing are due to the fact that the total area of the outlet openings in the cone is approximately equal to cross section of the exhaust pipe.

The inner cone used in truck mufflers checks the velocity of the gas in the outer cone slightly by diverting the direction of flow of the gas, thus increasing the time interval over which the exhaust is strung out in a muffler of given length. This increases the muffling effect without perceptibly increasing the back pressure.

# A Calorimeter for Determining the Heat of Ignition Sparks

A description of a new form of apparatus developed to determine the heat characteristics of sparks from different types of ignition apparatus is given together with the results of tests made with this equipment.

By H. A. Thornburg and E. B. Weaver\*

**O**WING to the great possibilities of improving the ignition of gases in the cylinders of gasoline engines by studying the properties of secondary electrical discharges and their effect upon combustible gases, the results of research work along this line should be valuable to both the carburetion and ignition engineer.

The exact cause of ignition and flame propagation in a combustible gas by an electrical discharge has not been indisputably determined. A combustible gas can be ignited by heat, percussion or ionization. As an electrical discharge may produce any of the above conditions it is evident that a simple, accurate and brief method of determining any one of the characteristics of the discharge is a large step toward a method of analyzing ignition phenomena.

The Bureau of Standards has done some work toward determining the heat of ignition sparks by means of a calorimeter described in Report No. 56 of The National Advisory Committee for Aeronautics which shows one of their methods as well as some of the results obtained.

The function of an ignition system is to produce a spark with the required characteristics to cause certain and rapid combustion in the engine cylinder at the required time.

The tests run in connection with this investigation were not to prove the superiority of any one ignition system but merely to test the applicability of the spark calorimeter and to determine the general heat characteristics of the sparks from the different types of ignition systems.

The calorimeter used consists of two glass air bulbs encircling a chamber for receiving the heating element or spark gap. Between these bulbs and connected to each is a manometer with release cocks used to equalize the pressure after filling. The spark calorimeter is shown diagrammatically in Fig. 1, while a photographic

\*—Condensed from a thesis submitted in the School of Electrical Engineering, Purdue University.

Fig. 1—Diagrammatic view of the spark calorimeter.

Fig. 2—(Above) view of the calorimeter. Fig. 3—(Below) view of driving apparatus and tachometer.

view of it is shown in Fig. 2. Fig. 3 shows the driving apparatus and electric tachometer.

The heating element and spark gap were placed in their respective chambers, the distributor speed was adjusted to a desired value, and the watt input to the heating element adjusted so that a balance was obtained in the manometer. The speed was then changed to the next value, a new balance obtained in the manometer and the watt input to the heating element again recorded. This procedure was followed for the required number of points, the heating element and spark gap then being interchanged, after which the same tests were repeated.

The energy in one bulb is equal to that in the other when a balance is obtained in the manometer; therefore, the easily measured energy input to the one bulb equals the energy input of the sparks in the other bulb, and the energy of one spark is the input per second divided by the number of sparks per second.

The difference in radiation of heat due to inequality of exposed areas of the air bulbs as well as the possible error due to unequal volumes of air being inclosed in the bulbs are corrected for by interchanging the heating element and spark gap and using the mean of the read-

Fig. 4—Curve showing that heat of the spark is not a function of the length of the spark gap

ings. The loss due to conduction through the leads is practically compensated for, as there are the same number of leads entering each bulb.

The passage of the spark through the air caused chemical reactions to take place, such as the formation of oxides of nitrogen, but the heat energy involved is negligible in comparison with the energy from the spark.

The standard spark gap length of 0.10 in. was used throughout the series of tests, because Bureau of Standards tests with a crest volt meter substantiate the fact that such a gap has the same break down voltage as that of an average spark plug in a high compression engine cylinder. What is still more important, the voltage drop across the terminals while the spark continues to pass is also practically the same as that occurring in an engine cylinder. Since the voltages above mentioned were measured with the gap in continuous operation, they include the effect of an accumulated ionization in the chamber, and therefore the fact that the gap is not ventilated is not an objection, but is essential to the measurements, for only under these conditions are the initial and sustaining voltages of the calorimeter the same as those in the average engine cylinder.

The errors encountered by using this apparatus and allowing from 5 to 10 minutes per reading should be well under 5 per cent.

The first test was for the determination of the effect

of the spark gap length upon the heat per spark with the other factors held constant. This test brought out the point that the heat per spark is not a function of the spark gap length within the range used as is shown graphically in Fig. 4.

A standard heat test was run, with the spark gap length held constant and the revolutions per minute varied between reasonable engine speeds, on one magneto and three battery ignition systems. The battery ignition heat per spark-speed characteristics were as shown in Figs. 5 to 7 inclusive. The curves all follow the same general law which is the same as that of the input curve, Fig. 6. The curve of Fig. 7 follows this general law to a certain speed and then falls off very rapidly, indicating that the theoretical number of sparks is not entering the spark chamber or, in other words, the ignition apparatus is missing. This introduces a new use for the spark calorimeter, as the slope of the curve indicates misfiring long before it can be detected by other means.

The magneto delivered a greater amount of energy to the spark gap than any of the battery outfits, and the curve of Fig. 8 shows that it had different characteristics. The magneto was operated with the timer fully advanced.

A standard Exide three-cell lead plate storage battery receiving a charge of nine amperes during test was used to supply power to the battery ignition sets during runs.

The authors regard the calorimeter as the best means of measuring the energy output of a high tension ignition system as the instruments ordinarily used in measuring electrical power are not suitable for such high voltages and feeble currents. The instruments for measuring the high voltages are subject to large errors and are cumbersome to handle.

A calorimeter as designed and used in the above work, operated upon a balance principle, with a zero method of obtaining readings, is far superior to the ordinary type as to its adaptability for a spark calorimeter, in that it is very sensitive and the readings may be had at short intervals and continuously from one point to the next with unusual precision.

Curves showing heat per spark in three battery systems (Figs. 5, 6 and 7) and one magneto system, Fig. 8

# Tolerances Allowed in Grinding Splined Shafts

An article discussing the practice employed by a manufacturer in grinding shafts to mate with splined fittings finished in accordance with S.A.E. standard practice. A table of tolerances is included.

CONSIDERABLE variation exists at the present time in regard to manufacturing practice on spline shafts. The Society of Automotive Engineers has standardized spline fittings, but the shafts themselves have not as yet been standardized, with the result that there is no uniformity in conditions as regards fit of these shafts. The tabulation herewith presented has been made up from blueprints provided by the Gear Grinding Machine Co., and is the practice recommended by that concern.

It will be noted that the bearing is solely on the ground surface of the inner diameter of the fitting, while considerable clearance is left at the bottom of the broached hole for the spline. It is an easy operation to grind the bore of the spline fitting. If it is necessary, however, to hold the depth of the broached holes to a small tolerance such as .001 in., the life of the broach is necessarily considerably shortened because it is impossible to regrind the broached cutter and still hold this limit. With the large clearances between the spline and the bottom of the

broached hole, the broach can be reground several times as .009 in. is allowed for wear. Inasmuch as the cost of these broaches ranges from \$75 to \$300, this represents a material saving. Another advantage of the large clear-

1—Drawing showing practice adopted by Gear Grinding Machine Co., for Standard 1-3/16 in. six spline shaft.

ance above the spline is the adequate provision for an oil pocket which is of assistance in lubrication. To hold the bottom of the broached hole to the close limits which prevail in some instances is a good example of unnecessary accuracy.

While the accompanying table is not a standard and has not been brought out as such, it is practice recommended by a concern which specializes in the grinding of splined shafts and as such deserves serious attention. It has been suggested that the societies concerned consider the adoption of some such set of tolerances for standardized prac-

tice in connection with the six spline fitting.

The tabulation herewith in common with the spline fitting standards, has been made up for three different conditions; that is, permanent fit, sliding fit without load and sliding fit with load. The permanent fit is for arbor press assembly, to be used for such parts as clutch spiders and other parts, which have no relative motion between the spline fitting and the shaft. The sliding fit without load is used on such parts as the sliding gear shaft on transmission gearsets, etc. The sliding fit with load is a free fit used in propeller shaft construction, etc.

## Lansden Electric Speed Truck

**T**HE success of the gasoline-propelled type of speed wagon and speed truck has evidently stirred the manufacturers of electric commercial vehicles to emulation, and a speed truck of 1500 lb. capacity is being announced by the Lansden Co., Inc. With an electric vehicle, of course, no such speeds as obtained with modern pneumatic tired gasoline trucks are possible, and the speed of the truck here described is limited to 15 m.p.h. loaded and 16½ m.p.h. empty. This, however, is quite an improvement over the speeds obtained with electric commercial vehicles running on solid rubber tires and is about up to the limit of the speeds permitted in cities.

The chassis without battery weighs 1700 lbs., the body allowance is 700 lbs. and the battery weight is 1385 lbs. in case of a lead battery and 1085 lbs. in case of an Edison battery, making the total weight of the truck in running condition 3685 lbs. with a lead battery and 3385 lbs. with an Edison battery. In connection with the Edison battery, which consists of 60 cells, a 60 volt 40 ampere motor is used, and in connection with the lead battery, of 50 cells, an 85 volt 30 ampere motor. The former runs at 1725 r.p.m. and the latter at 2150 r.p.m. A continuous torque type of controller is fitted, which gives four forward and two reverse speeds. The frame is of rolled

channel steel 3 x 1½ x 3/16 in. The truck is made in two lengths of wheelbase, 90 and 96 in., while the track is the standard 56 in. Thirty-two by 4½ in. pneumatic cord

Chassis of Lansden 1500 lb. electric speed truck

tires are used all around. The standard equipment consists of a tail lamp, two dash lamps, horn, hub odometer, Sangamo ampere-hour meter, a kit of tools and 12 ft. of cable with charging plug.

## The Sharon "Brute" Trailer

**T**HE industrial trailer here illustrated, a product of the Sharon Pressed Steel Co., was designed for heavy-duty service with tractors, in warehouses, terminals

Sharon "Brute" trailer. Bottom view showing construction features.

and transfer stations. The frame is made up of 4¾ in. channel sections pressed from ½ in. hot rolled open hearth steel, riveted into one piece, channel section corner pieces pressed to a 6 in. radius, with a hole for a stake pocket. The trailer can be made in any length up to 72 in. and in any width up to 50 in.

Two additional members running lengthwise beneath the floor are 3 in. pressed steel channel, riveted to the end rails and braced laterally to the frame with front and rear pressed steel "V" braces which take the pull of the 5/8 in. steel forged coupler. Either one or two couplers can be supplied.

Rear wheel and front caster supports are 3 in. pressed steel channels riveted to the side rails and longitudinal members of the frame. Rear wheel brackets are pressed from ¼ in. steel with two stiffening ribs on each side. Rear wheels are of malleable iron with six double-web spokes and 3½ in. face, with flexible roller bearings on a 1 in. shaft hardened and ground.

The front casters with ball and roller bearings are bolted to a ½ in. steel plate riveted to the frame. The floor of the trailer is 1½ in. oak, recessed flush in the side and end rails. All frame members are flush on the bottom—thus affording an even support when the trailer is used in connection with a lift truck.

# A Practical Analysis of British India as a Market for American Motor Vehicles

## Part I

In this and a following article is presented a detailed survey of British India as a market for cars and trucks. The author has a wide experience with this field and shows clearly the great potentialities, if proper methods are used. An important contribution to foreign selling data.

By Charles Sumner Turner

SIX months ago our export trade in passenger vehicles with British India abruptly stopped and has since been at a standstill. This condition follows a record year of exports to that market in 1920. There has been and continues some congestion of passenger car stocks in India in trade hands or held for the account of the trade. Considerable inconvenience and some distress attends this condition.

A review of the trade leading up to these conditions and an intimation of some of the causes will form the basis for a detailed and practical discussion of merchandising American cars in a market extremely rich in potential business if conditions are accurately known and proper methods are used. The prevailing depression in American automotive export trade makes this an opportune time to review the past and take therefrom such lessons as may be useful in formulating plans for future business.

Statistical information on American automotive exports for the year 1920 shows marked changes in the relative positions of importance of foreign markets. Certain distant markets are brought into sharp focus, among which British India, by purchasing among other of our automotive products over 12,000 passenger vehicles of a value approximating \$14,000,000, attained second position among our foreign markets for products in this class.

### Interpreting Export Figures

The foregoing figures inadequately evidence the actual benefits that accrued to the American passenger car industry from the British Indian trade, for the reason the several thousand Canadian-made vehicles appearing, directly and indirectly, in the British Indian Government import records, were, as regards the manufacture of their component parts, largely a product of American industry.

The record of our relative exports thus far this year and the prospect for the balance of the year indicate an export trade in passenger cars with British India that shall show a falling off by about 95 per cent of the 1920 year business. Consequently, it is necessary to accord

serious thought to ways and means for the American automotive industry to continue to secure the largest amount and share of the British Indian automotive trade.

The distance of the market from the United States, its peculiar trade conditions, and its past importance as a purchaser of American finished products have caused British India to be known and understood by the general automotive trade very disproportionately to the importance now attained. We have accorded our greatest attention to markets near to us, while several distant markets within themselves present greater sales opportunities than many of the former combined. British India, of such great size, distances and potentialities of material development, is only experiencing the genesis of motor transport.

In the last British Indian pre-war trade year, ending March 31, 1914, the total merchandise imports into India from all countries were approximately \$500,000,000, of which the United Kingdom supplied 65 per cent and the United States supplied 3 per cent, or about \$15,000,000. Of

our exports, mineral oils, iron and steel products comprised considerably more than one-half, and in the balance were included "Motor cars and cycles" of an approximate value \$750,000.

### Importance of Indian Market

In this year 868 American cars, mainly Ford, were imported into India. In the last trade year of British India ending March 31, 1921, the total merchandise imports from all countries reached the record valuation of approximately \$1,125,000,000, of which the United States supplied \$120,000,000, included in which were 10,120 motor cars, valued at \$15,025,000, the valuation of the import trade in American passenger cars for this year approximating the value of all imports from the United States in the last pre-war trade year.

During the 1919-20 year the trading of other automotive exporting countries was effectively renewed in India as is strongly evidenced in the following tabulation of Indian Government import statistics:

Imports of Motor Cars into India  
For fiscal years ending March 31.

From	1920		1921	
	Quantity	Value	Quantity	Value
United Kingdom .....	443	\$1,209,610.00	2,541	\$7,113,304.00
France .....	3	5,705.00	192	483,122.00
Italy .....	17	34,808.00	218	552,344.00
Other countries .....	84	139,274.00	423	862,829.00
	552	\$1,389,497.00	3,374	\$9,011,599.00
Canada .....	20	16,731.00	1,938	2,041,860.00
United States .....	9,353	10,149,010.00	10,120	15,024,529.00
	9,925	\$11,555,138.00	15,432	\$26,077,988.00

The above United States currency valuations have been arrived at by converting official Indian rupee valuations at adopted averages of 44 cents for the 1920 year and 33½ cents for the 1921 year, these being fair averages for the respective periods in considering the exchange movement.

It should be pointed out that the import figures relative to imports from Canada and the United States for the year 1920 are misleading, as will be explained further along.

It is interesting to review some of the incidents of American passenger car trade with British India over the seven year period including the years 1913-14 to 1920-21.

The accompanying graphic chart shows, by heavy solid line, the United States Government statistical record of passenger car exports, by years, from the United States to British India (and Ceylon). The light solid line at the bottom of the chart shows, for the years 1919 to 1921, the same record of monthly exports.

The broken lines show the British Indian Government statistical record of passenger car imports into British India and Burma (not including Ceylon) from the United Kingdom, United States, Canada and other countries. It is desired to point out that the seeming discrepancy in the two records is a matter of method and not of fact, and is due to the statistical method of the British Indian Government, according to which imports are recorded as from the point (by land or sea) merchandise is shipped to India, and not according to the country of origin. Therefore, the apparent excess amount and advanced movement of American passenger car imports into India to what is recorded in the United States Government figures, is explained by cars of Canadian origin being shipped through American seaports to India; further, the charted record of British Indian imports of passenger cars from Canada is not a true index of the number of Canadian cars imported, but can be assumed to show only such cars as were accommodated by steamship tonnage from a Canadian port to India direct. The movement of the Indian rupee exchange value, over the years 1919 to the middle of 1921, is also shown in graphic form.

### The Course of Trade

The chart shows that, in the last pre-war trade year, British India was importing from the United Kingdom twice as many (1670) passenger cars as from the United States (868), the import valuation of the former being five times that of the latter. The predominance of Ford cars makes it reasonable to assume that, as regards other makes of American motor vehicles, the position of such cars in the market was inferior to the position of cars "imported from other countries," namely, Continental Europe (268).

The drop in car imports to the middle of 1915 reflects the realignments and adjustments of trade, which were attended by general depression incident to the first year of

the war. The adverse effect on car imports from all sources was generally the same.

The car import record throughout the balance of 1915 and into 1916 shows a further falling off of United Kingdom trade with the territory due to the diversion of manufactured products of that country to war purposes, while imports of American vehicles continued rapidly increasing, due to demands resulting from the beginnings of an unprecedented prosperity within British India which continued well into the year 1920.

India's staple and manufactured products benefited by the war demands and the general prosperity of her customers removed from the war area, and not only were extraordinary profits made in industry and trade, but new trade routes were defined in the Near East, the Mesopotamian campaign having been largely manned, provisioned, and supplied from Indian industry. Thus British India experienced an industrial rebirth which is viewed with great interest and satisfaction within and without the country. This portends an increased expansion and extension of the indigenous industries of the country and greater independence of outside sources of supply in many lines of manufactured goods.

### The Embargo

In December, 1916, an embargo was placed by the Indian Government on the import of motor cars, with a view to the saving of tonnage and fuel, and thereafter, except for the few months required for vehicles en route to arrive in the market, the importation of cars from any sources whatever was stopped for two years.

At the time the embargo was announced, American passenger cars were rapidly attaining an enviable position in the Indian market. The business resulted largely from demands of the market and was attended by a minimum of solicitation by and expense to the American manufacturers and traders benefiting therefrom.

The lifting of the embargo (in December, 1918) found India enjoying extraordinary prosperity. Shortly a very extraordinary and seemingly insatiable demand for American passenger cars was manifested to the industry in this country. Making due allowance for the incident of the American automotive industry transition from a war to a peace basis and their problems with domestic demands, from an export business viewpoint, the record of passenger car exports from the United States to British India throughout the year 1919 evidences insufficient enterprise in meeting an exceptional opportunity. During this year only 2624 American passenger cars were exported to India. The seemingly discrepant record of British Indian imports is explained by Canadian made vehicles passing through American seaports for shipment to India and such appearing in the records incorrectly as imports from the United States.

The Ford Motor Co. apparently made the most of the opportunity in India by shipping large quantities of cars early. These arrived in the territory at the time of an extraordinary demand and an appreciating exchange value of the local currency. Thus material benefits accrued to the manufacturers, their dealers and the buying public. Furthermore, during this period this company made long strides in developing their merchandising policy in the territory by dictating the segregation of their affairs, by the principal dealers concerned, into distinct corporate concerns dealing exclusively with this firm's product.

### Unsound Selling Methods

In the winter months of 1919-20, American factories began the movement of extraordinary quantities of passenger cars against Indian orders, in many cases considerably deferred in their execution, and the complete story

of the incidents and effect of the large shipments to India throughout the year 1920 cannot be told at this time. Some manufacturers, financiers and dealers concerned with the business are continuing to experience inconvenience, and of the latter some are in distress.

As the movement of passenger cars from the United States to India got well under way in 1920, the peak of prosperity in the latter country was passed, but an extraordinary movement of cars continued throughout the year in the face of a precipitant reaction of general trade in the market, effecting renewed trading there by other automotive exporting countries and the rapidly depreciating rupee exchange value, the movement of which, over the nine months' period from March to December, 1920, affected adversely by 100 per cent the rupee cost of an American car in the territory, assuming no change in the factory cost of a car over that period. Dealers, where the precaution to arrange exchange protection had not been exercised, found themselves obliged to pay against arriving stocks of cars up to twice the amount of the local currency as anticipated at the time the orders were placed.

The exchange factor in foreign trade has now become a matter of serious consideration with manufacturers, who in the past may have viewed the subject with indifference. To many this factor appears an obstacle to much foreign trade at present. This is true only to a limited extent. While a trade deterrent, it will gradually appear less as an obstacle as its stability is effected, even if at materially depreciated value, in so far as pertains to trade in requisite merchandise. Renewal of trade will be the greatest contributing factor of exchange recovery, whatever expedients therefor may be devised by governments and financial interests.

India in pre-war days enjoyed a fairly constant exchange value for her currency and, until the middle of 1920, the appreciated value of the currency was advan-

tageous to purchases by that country from the United States. The present instability of Indian exchange perplexes those heretofore experienced with an approximately fixed or favorable value.

### Meet Obligations Promptly

An element of British Indian trade stands, at this time, discredited by their refusal to promptly meet their obligations in the face of extraordinary trade and economic conditions, and endeavor to justify their attitude by contending that manufacturers shipped late and that authorities bungled exchange. The large majority of American motor cars that went to India having been purchased by, or the purchases having been financed by Anglo-Saxon banks and firms, the foregoing difficulty is reflected lightly on the car manufacturers that supplied the market. Credit facilities, however, for the future must depend upon preciseness in method and a mutual recognition of obligation by buyers and sellers.

The abnormal car exports from the United States in 1920 would, if considered as distributed over a three-year period, have been sub-normal yearly shipments, assuming British Indian imports for the year 1917 to be a fairly accurate index of the buying power of the market at that time in its development. The normal yearly purchase potentialities of the market is probably higher than the example cited.

### Causes of Congestion

The present congestion of passenger cars in trade hands, or held for the account of traders, results from over-ordering, imprudent credit facilities, and deferred shipments by manufacturers. Dealers in many cases undertook on paper more than they possessed the physical and financial facilities to assimilate, except in such ordered manner as their original plans of business proposed. Consequently the radically changed economic conditions in the territory disrupted automotive trade conditions particularly.

Deferred shipments by some American car manufacturers are among the vital causes of the present car congestion and consequent stoppage of business in this line out of British India. The intelligent treatment of an export order requires that a manufacturer regard the distance of the buying market from the factory. Priority of consideration to orders destined for the most distant markets is only common sense, but it has not been common practice. British Indian seaports are, under most favorable conditions of transport, four months distant from a factory in the Detroit district. Normally, a distributor or agent when ordering and arranging financial facilities, must act approximately six months prior to his anticipated receipt of merchandise. American automotive export trade must move to normalcy of volume, value and method. Hereafter intelligent effort must replace the easily available credit facilities that have encouraged much past business, the good will of which is difficult to discern.

Less than a dozen American passenger car manufacturers can rightly claim an intimate knowledge of the British Indian market and its dealer trade. The arrangements and products of these few manufacturers are well advanced along the trade's evolution in the market. Motor trade establishments in India have much to do in the matters of developing organizations physically and financially commensurate with problems and volume of business incidental to a proper merchandising of American automotive products. The burden rests on the American manufacturer to assist intelligently in this evolution.

The important Indian pre-war firms engaged in the automotive trade resulted from trading in English and Continental cars. These firms, and they are not many, are

pre-eminent to-day and control the best agencies. Meanwhile, they undoubtedly have at times the refusal of every interesting agency proposition seeking introduction to the market.

The abnormal business of the recent past has caused many firms and individuals to be attracted by the automotive trade prospects of profit, and the future success thereof manufacturers may assist according to the degree of intelligent co-operation they extend.

Many manufacturers, if they would continue to share in the British Indian automotive trade, must predicate future arrangements on a proper knowledge of that market and its trade, and a useful presentation, therefore, shall appear in a following article.

The present trade depression in India is a reaction from abnormal trade conditions over several years of great prosperity and is consonant with world wide trade depression at this time. The future of British Indian trade, however, was never more interesting than at the present time. Statistical information assigns to British India an important position among the world's markets for our automotive products. Of the markets for motor vehicles where trade is at this time affected adversely, it is expected by those conversant with the market that British India will recover among the first.

The impending visit of the Prince of Wales in November this year shall have a very beneficial effect on the motor trade in India. We have generally little comprehension here in America of the general commotion of population, ceremonies peculiar to the people and the institutions of the country, and the disbursements that shall be an incident of this imperial honor to the British Empire.

When considering future motor trade with the territory, manufacturers will do well to disregard the facility and economy that attended the consummation of the extraordinary business of recent years, and regard thoughtfully the hindrances to our trade actual or in prospect at the present time. Some manufacturers, if they would successfully meet future conditions and perpetuate that goodwill which should attend their past business, must seriously consider capital investment against prospective, if not immediate business.

### Building Permanent Business

At the moment visible signs show American manufacturers to be generally inactive. Advertising of American cars in effective British Indian media is conspicuous by its absence, except Ford advertising. British manufacturers, on the other hand, are very active and are freely advertising their products. They realize there is hard work to be done to regain the trade from which they were eliminated by war conditions.

As stated hereinbefore, the foremost motor trading firms in India owe their beginnings to the agencies for British and Continental cars, and relationships continued for years prior to the war appear to be maintained to the present, as agencies generally continue in the same hands as in pre-war days. The British Indian trade came to America for cars during and after the war and many dealers there, wrongly or rightly, are not particularly happy with all the results that have accrued from the business. American car manufacturers should recognize the fact that, in the competition for trade, the British manufacturer has many psychological and some economic factors in his favor under prevailing conditions. Continental manufacturers enjoy some advantages also.

Statistically, however, India is America's foreign car market of second importance. And an analysis of the potentialities of the market confirm this rank, provided the trade is intelligently and aggressively solicited.

# 1922 a Light Car Year in Great Britain

American lightness is to be blended with European fuel economy in the 1922 British models according to present indications. The day of the expensive car in England appears to be waning. General specifications of the predominating type for 1922 are indicated in this article.

**B**RITISH makers of cars have nearly settled the details of their 1922 season's program, and it is possible at present to surmise the trend, though unsafe to deal with the question except in a general way. It may be definitely stated, however, that 1922 will be a light-car year. And by "light car" is meant a blend of American lightness and roominess with the higher economy of the European type of engine.

A reduction of the horsepower tax, which at present is \$1 per horsepower by formula rating, has been promised. If this reduction is announced soon, it may be assumed safely that the standing rating for 1922 season's cars will be not less than 15 hp. If the power tax be reduced by a third, it will mean that the 15-hp. (usually 15.9) car, now taxed \$15, will pay the reduced rate of \$10. The 15-hp. engine will make a great difference in the light-car outlook. A car will be produced on the lines the public wants; namely, a car with plenty of power and a reasonably large cylinder bore and ample room or girth of body.

The next problem is price. An average all-round, popular-priced car, not exceeding \$2,000, with \$1,500 as the mean rate, is likely to develop. The day of the high-priced, expensive car is waning, if it has not entirely passed away. If the 15-hp. model at the lower taxing rating be the standard, then there is likely to be a trend to six cylinders instead of four. This means a bore not exceeding 64 mm. (2.5 in.) or 78 mm. (3 in.) for a four-cylinder engine.

One of the biggest percentage falls in British car prices is that announced by the Rover company to take effect from September 1. It applies to the 12-hp., four-cylinder model (3 x 5½ in.), the four-passenger car being reduced from \$3,875 to \$3,200. Following on the recent price reductions of Rolls-Royce and Lanchester (each to the extent of \$1,250), the Rover announcement indicates that not only the high-priced among British cars will be subject to big cuts in the general downward trend to be anticipated before the Olympia Show.

To the names of well-known British firms mentioned in AUTOMOTIVE INDUSTRIES of August 18 as planning to produce a light runabout for next year to compete with the highly successful 8-hp., two-cylinder, air-cooled Rover may now be added those of Wolseley and Belsize. The Belsize will have a modified form of the Bradshaw "oil-cooled," two-cylinder engine introduced at last year's motorcycle show at Olympia. Only the aluminum heads of the cylinders and the overhead valves are exposed to an air draught, the cylinder barrels being inclosed in the crankcase and oil cooled by the lubricant therein. The oil sump contains approximately double the quantity of oil carried in a normal engine of this size (3⅜ x 4½ in.) and, like the cylinder heads, is cooled by an air draught induced by the fan on the front end of the crankshaft. The plate clutch is located at the rear end of the gear-set; its driving members run at engine speed as usual, but the driven member is provided

with a brake rotating with the propeller shaft so that gear shifting is said to be greatly facilitated. With one seat wide enough for three adults abreast, the car is planned to sell at about \$1,200.

As a means to price reduction it is quite possible that the Wolseley company's lead with their "10" may be followed largely. In this case the Wolseley company is listing the "10" at a reduced price with a less elaborate finish, without a starter, but at its present price, \$2,400, this model—only a two-seater—is too dear for next season's trade.

General specification will probably be along the following lines:

Engine, a four (or six) en bloc combining the upper part of crankcase, with bore and stroke of 3 x 5 in.

Dynamo and ignition combined.

Vacuum-gravity fuel feed to a direct-bolted carbureter. Gravity cooling.

Pump oiling.

Overhead inclosed valves and inside camshaft, electric starter optional, and a demountable radiator.

Transmission, fabric-faced dry-plate or cone clutch.

Direct-coupled gear box with center gate control, four speeds and reverse gear, fabric disk couplings, spiral-bevel axle.

Short cantilever springs rear, semi-elliptic front, and dual brakes on rear axle.

Gross weight of car, with roomy, four-seater body, not exceeding 22 cwt.

Manufacturing economies will be emphasized and probably after the season's experience it will be decided to continue the design unaltered and cut the price for 1923 season, which will be the year of the great British International Show. If a program on these lines be adhered to and the wheel track be standardized to 4 ft. 8 in. (56 in.), it may happen that 1923 will usher in a renewed activity of British car enterprise in the British overseas market.

Excellent advice to American car makers interested in or prospecting this market would be:

1. Send your chassis here without bodies.
2. Improve your brakes and brake adjustment.
3. Cut your engine bore down to 3 in.
4. Get the power by lengthening stroke (3 x 5 in. is a good rate for Europe).
5. Above all, scrap your demountable rims and substitute hub-bolted wheels.
6. Stick to the wood type, for there will be a reaction here toward the wheel-like wheel (mostly the hollow-metal-spoked type), and the wire wheel will not survive on cheaper cars.

A considerable drop in tire prices may be looked for. With labor costs down, tires at about half present rates, chassis weights pared by 400 to 500 lb. and material markets decontrolled from the trusts and rings, there will be a \$500 saving in the average car's production cost.

# Decreasing Overhead by Increasing Individual Capacity

Better production is really a by-product of better men and better organization. Mechanical equipment cannot overcome all the difficulties of human variation. Overhead charges in many large organizations exceed by half total labor and material charges. The remedy is discussed here.

By Harry Tipper

**T**HERE is a distinct tendency for the average capacity of the individual worker to decrease as the number of workers in the organization increases. Side by side with this tendency there is a constant tendency for the system to grow more rapidly than the amount of business would warrant, so that the opportunity for development in the individual is somewhat less.

There is, of course, a great variation in the actual development of these tendencies in different organizations due to the character of the management and the individual method of organizing. But the tendency is unmistakable and is to be observed in the growth of industrial organizations almost without exception.

The decreased average capacity is due partly to the larger difficulties in selection, requiring the manufacturer to accept workers in much larger quantities than the highly skilled minority, so that the average capacity and skill is decreased within the group as the size of the group grows.

The most important element, however, in the tendency for the individual capacity to decrease is the increased rigidity of the worker's skill, as the size of the organization grows and the number of subdivisions increases.

In small organizations it is necessary that a much larger proportion of the workers possess a capacity sufficiently flexible to permit their use for a number of different items of work. This necessity encourages the adaptability and increases the flexibility of the organization, so that each worker is used much more nearly to his capacity and the balance of the organization is preserved more accurately.

Any manufacturer who will think back to the days when he employed forty or fifty men, including his executives, will realize that most of these men were doing a great many jobs that are now the sole occupations of some specialized subdivision. They were able to accommodate themselves to the varying needs of the organization much more accurately and their capacity for growth was increased because of this adaptability and its effect upon the organization itself.

The large manufacturing concern with its thousands of employees has subdivided its work to such an extent that very few of the workers are skilled in more than one subdivision and frequently not in more than one fraction of the subdivision. They are not capable of adapting themselves to the fluctuating requirements of production within the department to the same extent. They cannot be used to consolidate the work of more than one department to the same degree, so that it is difficult to main-

tain the organization with all the individuals working at capacity and with the personnel balanced to the requirements.

This tendency has a good deal to do with the constant increase in the proportion of expense required for supervision and overhead in the factory costs. Not many years ago after the labor and materials were determined, 50 per cent was frequently sufficient to cover the rest of the costs. In many large factories to-day after the labor and materials have been determined, it is necessary to add 150 per cent in order to cover the fixed charges and the undivided items.

The subdivision and the increasing specialization which always grows with the large increases in the number of people employed in the organization demand a centralized system that has a tendency to enlarge itself more rapidly than the problem would warrant. Perhaps "demand" is not the correct word to use in this case, because the systems employed at present have not justified their existence as necessities in large organizations to the degree in which they have been used.

The past practice has assumed that these centralized systems were necessary with the constant subdivision of the work, and they have grown with great rapidity.

For instance, a man was called recently to the head of a business office to rearrange the work and put it on a better basis. He started in to familiarize himself with the methods employed. Picking up a letter which required an answer giving the customer certain information, he asked what would be done about it. He found that six people handled that letter before it was answered. Yet the same kind of letter was answered every day and the information was available to any of the clerks.

Subdivision of work and the arrangement of the system to agree with the subdivisions, rather than with the necessities, had created such a rigidity that the cost of some of the work was multiplied four or five times.

The examination of many of the factory systems will show a considerable percentage of the same rigid development without regard to the object but with a great deal of attention to the subdivisions and specialized departments. This tendency to a rigid subdivision and system itself still further decreases the average capacity by discouraging adaptability and increasing the difficulty of maximum work and balanced operations.

One of the well-known industrial engineers, in talking of a great industry the other day, claimed that not one of the factories in that industry was balanced so that it could operate full time in all departments and secure

a co-ordinated production. This is partly accounted for by the narrow specialization in the work and the rigidity of the system with their effect upon the natural adaptability of the intellect and flexibility of the skill.

The question is one of management. If it is possible for a hundred people to work together with a fair degree of human efficiency, a reasonable degree of understanding, and a flexible arrangement of production it is possible to get five thousand working together in the same way. True, it takes a great deal more study and analysis, more patience and time and a large consideration of the human side of industrial matters.

Managers of industry must do something, however. Prices have to come down. Competition must be faced. Greater efficiency must be secured. Every manager of industry knows that this cannot be secured out of the mechanical equipment improvement by itself. The 150 per cent of overhead is a good place to do some experimentation and analysis.

It should not be necessary to pay for the capital, accounting, office inspection, supervision, and so forth, more than the total actual production from the labor and material standpoint.

It is not likely that we shall do much along these lines so long as we continue to work under the idea that the product is more important than the man. We must be-

gin to get the idea that the product is the result of a more efficient man. Better production calls for better men and better management. Better production is really a by-product of better men and better organization. Mechanical equipment cannot overcome all the difficulties in human variation and all the wastes arising out of human misunderstanding.

A development of larger groups because of the greater value of the mechanical equipment through the co-operative effort of the larger groups will speedily reach its maximum unless the groups themselves are welded into a more definite organization with a larger distribution of responsibility in the proper proportion.

The machinery of industry is capable of being improved very greatly from a mechanical standpoint even to-day, but the speed of improvement will bear a very much smaller ratio to the total volume, so that the individual improvement in the mechanical appliances will not overcome the increasing cost of human failure.

The co-operation of the individual so that the men represent a high standard of efficiency and a large common measure of understanding, the welding of these small groups into larger groups so that the ideal of the whole establishment is translated into the same ideal standard of operation, are matters of much more importance than the development of the mechanical improvement, and the rewards in production efficiency will be considerably greater.

## Aircraft Engine Development

IN aircraft engines light weight is one of the important features, though it must not be obtained at the expense of reliability. This applies particularly to engines for commercial airplanes. Tests on the block quickly bring to light all weak points in the design of an engine, provided the materials of construction used were properly tested at the factory as to quality and suitability. But such tests give no indication of parts which could be reduced in weight without injury to the performance of the engine as a whole. It is for this reason that the lightening of water-cooled, 'stationary' aircraft engines, which were developed from automobile engines, proceeded rather slowly.

The development of rotary engines proceeded substantially in the opposite direction. In the design of these it seems that it was the practice to adopt what to educated judgment seemed the lightest permissible dimensions and leave it to practical use to develop the weak points, where it was absolutely necessary to strengthen the construction. In almost every case it was so-called notch points, that is, points with sharp corners or changes in section, where fatigue showed first and cracks developed. This method of gaining experience is rapid but painful and expensive, and it can be followed only if sufficient capital is available and eventual success is fully assured.

It is the opinion of Dechamps and Kutzbach, who deal with the subject in their book on Tests, Rating and Experimental Development of Aircraft Engines (Prüfung, Wertung und Weiterentwicklung von Flugmotoren, Vol. VI, Part 1, of the Handbook of Aircraft Engineering, published by Richard Carl Schmidt) that rational calculations of strength, with consideration of the increased stresses at points of abrupt change in section, would have saved many an expensive experience. Even the dreaded critical speeds of shafts or complete assemblies can be calculated in advance with tolerable accuracy, and trouble therefrom avoided.

The book under review is the result of experience gained during the war at the engine testing plant at

Adlershof, Dechamps having been in charge of the organizing work, as general manager, while Kutzbach acted in a scientific advisory capacity. Each of the authors is responsible for a number of the chapters. The following chapter heads give an idea of the scope of the work: Introduction; Testing Equipment; Testing Methods; Results of General Engine Tests; Researches on Changes in Output and Consumption; Contributions Concerning Fuel Feed and Carburetor Development; Contributions Concerning Engine Design; Retrospect and Prospect.

In the chapter on engine design the subject of gear reductions is gone into at considerable length, and a chart is given showing twelve possible designs with three shafts.

## Destination of Italian Exported Vehicles

THE destination of the motor cars and trucks exported from Italy is stated in a recent copy of the United States Commerce report. These figures include trucks for the years 1918, 1919 and 1920. A tabulation of the shipments for five years follows:

Countries of Destination	1911	1914	1918	1919	1920
England .....	939	985	...	144	3,068
Spain .....	32	36	30	159	1,198
Switzerland .....	81	219	8	218	982
Belgium .....	168	17	131	291	608
British India .....	11	48	1	73	568
France .....	295	210	2,673	259	451
Turkey .....	6	36	...	74	363
Argentina .....	378	131	4	5	332
Holland .....	46	41	...	36	233
Egypt .....	5	3	4	35	279
Algeria .....	...	2	...	235	227
Brazil .....	153	35	2	14	214
United States .....	144	217	...	14	209
Portugal .....	5	22	11	160	189

## Decreasing Overhead Costs

CONSIDERABLE time has been spent during recent years in devising systems of factory control and operation. Strenuous efforts have been made to so perfect methods of personnel control that the possibility of human error is reduced to a minimum. These attempts have aimed to remove from the individual the necessity for assuming responsibility; to lay out rules and regulations to cover every possible variation in practice so that under every condition the individual will have a rule by which to guide his actions.

The ultimate development of such a tendency would be to centralize responsibility so narrowly as to make the mass of workers mere machines. The result of such a process means a greatly increased overhead expense, a system of checks and regulations that becomes unwieldy and an enormous increase in the total manufacturing expense.

In proportion as individual responsibility is decreased the cost of supervision increases. It is not an easy task to develop men so that they are capable of assuming a larger degree of responsibility, but

efforts along this line pay better ultimately than those in the other direction. A careful study of the human element and an attempt to develop the capabilities of the individual to the highest degree is likely to be a large factor in the reduction of overhead costs in large organizations.

## Front Wheel Drive

RECENTLY there has been renewed activity in connection with front wheel drives for passenger cars. Various advantages are claimed for this drive, and its advocates hold it superior to the rear wheel drive now in almost universal use.

In the past the front wheel drive has met with a certain measure of success in connection with commercial vehicles. We need only mention the Latil front drive truck manufactured in France for a great many years, and the Christie front drive which has been exploited on a small scale in this country. In the great majority of the applications the fact that the front drive construction leaves the rear part entirely free of mechanism and permits of placing the body very close to the ground has been of particular value and really the reason for the selection of a front-driven truck or fore carriage. The rear axle, which is a plain or dead axle, may be cranked down between the wheels and the body brought within a foot or less of the ground. Such trucks have been used for the transportation of horses, for instance; and motor fore carriages have also been used for converting horse-drawn fire equipment.

The possibility of placing the body lower down would also exist in front-driven passenger cars, but it is doubtful whether its advantage would be rated very highly. If the rear axle were cranked and the body made sufficiently narrow to go between the crank arms, certainly not more than two persons would be accommodated on the rear seat. Such low seating would, of course, add to the stability of the car at high speed, but, on the other hand, it would bring the passengers closer to the dust of the road, and from this standpoint would be objectionable.

As a rule it is not the possibility of lowering the body that is urged as the main advantage of the front drive as applied to passenger cars. The claim is made that the transmission of power is more efficient in a front than in a rear drive, as the car is pulled along the road instead of being pushed; also that there is less tendency to skid. It is conceivable that under certain conditions power can be applied to greater advantage to the front than to the rear wheels. For instance, if the front wheels are located in a depression in the road, with rear drive there is a tendency to force the wheels into the far bank of the depression, whereas with front drive the wheels have a tendency to climb the far bank. A cross ditch or depression which would stall a rear driven car would therefore not necessarily halt a front drive machine.

It has also been argued that a front wheel-driven car is more efficient in turning corners. This claim is open to doubt, however. In turning a corner, with a properly laid out steering gear, both the front and the rear wheels move in circles around the same axis.

The front wheel tracks have a greater radius, however, than the rear wheel tracks, and with the same gear reduction to the front and rear wheels in cars which are similar except that one has a front drive and the other a rear drive, the front driven one would be able to exert the maximum driving effort on curves. The engine geared to the front wheels, however, would have to turn a greater number of times to complete a certain turn and would therefore do more work if the power output was the same in both cases. The front drive is therefore not really more efficient in this case but it gives the engine a bigger mechanical advantage, which corresponds to a lower gear.

Whatever advantages are offered by the front wheel drive are more than balanced by the complication of driving connections to wheels which have to swing around a vertical axis in steering. Most of the universal joints employed for this purpose introduce a periodic variation in the speed relation of the driving and driven parts, which at high speeds results in heavy strains on the connected parts. It is, moreover, a rather difficult problem to find room for both the engine and transmission in the limited space above the front axle; if the transmission were placed either above or below the engine instead of in line therewith, it would necessitate an additional gearset which would have to carry the engine power at all times, and this would involve power losses probably as great as the gains due to the various causes pointed out.

## The Day of Bus Transportation at Hand

**T**HERE are evidences that we shall shortly see a rapid growth in bus transportation in many parts of the country, and some truck manufacturers are preparing to meet this demand by the design of chassis especially adapted for this service. A description of one such chassis appears in this issue of *AUTOMOTIVE INDUSTRIES* and other articles dealing with various phases of bus transportation will appear from time to time in these columns.

It is important that car and truck builders who expect to enter and remain in this particular branch of automotive activity study the situation with a view to learning the fundamental facts which determine the difference between a successful and an unsuccessful product. It is hardly to be expected that an ordinary truck chassis equipped with a bus body, but devised with little thought for the comfort and safety of the passengers, can hope to compete very long with a vehicle especially designed for bus service. Nevertheless many units of the truck and the bus can be identical or very similar in character.

There may always be a certain percentage of improvised buses or so-called "jitneys" in service, but the public will soon recognize the difference between a comfortable and safe vehicle under competent and responsible operation on a regular schedule and one which is the reverse. Much harm can and has already been done by the latter type in creating prejudice which must be faced and overcome by intelligent education fostered by the manufacturer who is prepared to build and market a thoroughly creditable product.

It is certain that the bus must be made as safe as it is possible to construct it. It should be made comfortable to ride in and easy to enter and alight from. It should be economical to operate, especially as regards fuel consumption and tires, and upkeep cost should be minimized. No vehicle should be sold knowingly for service in which it cannot be expected to operate at a profit with ample allowance for depreciation, for experience gained in uneconomical operation reacts to the disadvantage of the manufacturer.

The sales possibilities in this field have not yet been examined to any great extent. In fact, the potential use of motor bus transportation still constitutes an entirely uncharted field. Efforts to develop in this direction will be of benefit to the truck industry.

These are some of the essentials to be considered by companies which contemplate entering the bus field. There is evidently an opportunity for the manufacturer who is willing to study and analyze these and other factors upon which to build a business and a reputation. Without such an analysis, however, the possibilities of success are minimized.

## Use of Cradle Type of Fan Dynamometers

**F**AN dynamometers have been used in the automotive industry to some extent, but their usefulness has been limited by the fact that the results obtained depend on the atmospheric temperature and pressure as well as on the proximity of walls. Consequently it is impossible to give a simple formula by which to determine the output of the engine from them. This disadvantage of the fan dynamometer was overcome by aircraft engineers, who mounted the engine on a cradle and provided the crankshaft with either a propeller or a club, so that the torque reaction could be measured exactly as in the case of an electric dynamometer. No calibration curve of the fan is then needed. Both the speed and the torque are measured directly and their product is a measure of the horsepower delivered to the fan.

It would seem that this principle could be used to advantage also in automobile engine shops. At any rate, if fan dynamometers are installed, it is desirable to make them of the cradle type so that accurate measurements can be made with them under all conditions. The electric dynamometer has the advantage over the fan dynamometer that the relation between rotary speed and torque can be changed at will while the engine is running, which is not possible with the fan dynamometer, unless the fan be enclosed in a casing with a variable opening at the inlet or discharge. With a dynamometer having adjustable aluminum blades the load can be changed while the engine is at rest. In many respects the fan dynamometer of the cradle type would seem to be the equal of the electric cradle dynamometer, and the disposal of the energy absorbed requires no auxiliary apparatus. The cost of construction should be in favor of the fan dynamometer, especially in the case of small machines. On the other hand, the electric type is much more quiet in operation, and can be used to crank the engine or to drive it when it is desired to measure the friction hp. or to run the engine in.

# Good Business Conquers Pessimism

## August Sales 70% of Same Month 1920

**Prospects Are September Will Be  
on Par with August—Optimism  
Prevalent**

NEW YORK, Sept. 14—Pessimism which has been apparent in Wall Street for some time in reference to the automotive industry is not justified by actual conditions and has not been since March. August sales, exclusive of Ford, were 70 per cent of sales for August last year and were 2 per cent in excess of July. Business for July was 7 per cent better than in June. Ford sales for this period were larger than ever before in the history of the company.

Prospects are that with Ford, Dodge, Buick and Studebaker as leaders, sales in September will be on a par with those for August. In comparison with other years mid-summer sales of passenger cars were almost unprecedentedly large in relation to the earlier months.

### Trucks Improving

While the commercial vehicle branch of the industry is still at low ebb it is gradually improving and there has been apparent in the last few weeks a considerably increased demand for light delivery trucks.

Not only was the vehicle manufacturing end of the business better in August than in July but the same was true of parts and accessory manufacturers. July for them was slightly better than June and August slightly better than July. New orders and releases already received for this month indicate that there will be no falling off. Gradual reduction in tire production may be expected as the touring season comes to an end.

Purchasers of automobiles are being given the benefit of lower manufacturing costs resulting from wage reductions, greater labor efficiency and lower cost of materials. Keener competition also is a factor in price cuts on cars and trucks.

### Retailers Hopeful

Retailers and distributors are hopeful, however, that whatever price adjustments remain to be made will be put into effect at once for they believe price stabilization is necessary before there can be stabilization of sales.

In some sections dealers expect the belief of prospects that there will be further price cuts may interfere somewhat with September sales. There is general expectation that after this month

business will gradually taper off until the show season in January but this is a perennial condition. There is in prospect an unusually heavy demand for enclosed models of passenger cars. The large number of new models which will be brought out this fall by makers of popular lines also are expected to stimulate sales. These two factors will prevent anything in the nature of a disastrous slump.

## Wilmer, New Goodyear Head in California

SAN FRANCISCO, CAL., Sept. 12—E. G. Wilmer has succeeded to the presidency of the Goodyear Tire and Rubber Co. of California, and its subsidiary, the Goodyear Textile Mills Co. The board of directors of the Goodyear Textile Mills Co., on Sept. 3, accepted the resignations of F. A. Seiberling, S. A. Steer, and C. N. Turner, and elected Wilmer, G. M. Stadelman and P. W. Litchfield to fill the vacancies. The new board, in turn, elected Wilmer to succeed Seiberling as president, and declared the quarterly dividend of 1¼ per cent on the preferred stock of the company, payable Oct. 1. Dividends in arrears, it was announced, will be paid when the company's financial situation permits. Following his election as president, Wilmer issued the following statement:

**Assets \$6,000,000**

"After giving due effect to an adequate write-down of inventories, as of March 1, 1921, and offsetting the profits accruing from operations subsequent to March 1, there is an existing deficit as of July 31, of approximately \$2,400,000. On the basis of the current costs of operation, made possible by the write-downs of inventories, the company has conducted its operations from March 1 to July 31 at an average profit of approximately \$200,000 per month, available for interest and reduction of deficit. The cash and current positions are most gratifying. On July 31, current assets approximated \$6,000,000 and current liabilities \$625,000, while the company's cash balance was approximately \$1,000,000."

### NELSON FILES PETITION

DETROIT, Sept. 8—The E. A. Nelson Automobile Co. has filed a voluntary petition in bankruptcy. The liabilities are given as \$122,207 including unsecured claims of \$119,559. The nominal assets are listed at \$501,013 but \$432,000 of this amount is credited to patents, copyrights, trade-marks and development work. Cash on hand amounts to \$25. The E. A. Nelson Automobile Co. took over the bankrupt E. A. Nelson Motor Car Co. on March 23, 1920.

## Fordson Production Is Now 26,000 a Month

**200,000th Machine Built at River  
Rouge Plant—Officials  
Thoroughly Pleased**

DETROIT, Sept. 12—Production of Fordson tractors at the River Rouge plant from March 1 to Aug. 1 totaled 26,000, a showing which the company feels thoroughly satisfied with in view of existing business conditions. In August the 200,000th Fordson was built and will be kept at the plant as an emblem of the growth of the tractor business since its inception.

Despite adverse foreign trade conditions, the company notes that many tractors have been shipped to Canada, South America and other foreign lands, 700 going to Canada alone. A large increase in Fordson business in Europe is being cultivated in view of the improved trade and business conditions there.

Of the Fordsons distributed in the United States in the past five months, Ohio has been the largest buyer, more than 3000 going there. Pennsylvania came second with a sale of 2800 machines. New York State farmers took over 2300 and Michigan and Wisconsin were about even for fourth, each taking about 1800. Indiana came next in the order of distribution and New Jersey seventh. Virginia, Illinois, Massachusetts, Minnesota, California, Washington, Tennessee, Connecticut and Oregon were among the leading States.

## Price Reductions Aid Car Sales in Columbus

COLUMBUS, Sept. 12—With the reduction in prices of the Ford, Overland, Oldsmobile, Chevrolet and several other makes, trade in passenger cars in Columbus has been stimulated. All of the dealers who handled the makes on which reductions were made reported a marked increase in demand with business much better than was anticipated.

Other lines have been selling fairly well and dealers report a fair business. When present unsettled business conditions are considered business is better than might be expected.

The unemployment situation in Columbus has improved to a certain extent recently and this has the effect of instilling optimism into the dealers and salesmen. The feeling in industrial circles is improved to a large degree and orders are not quite so hard to land as formerly. Prospects for the future are considered fairly good and dealers in passenger cars believe that the fall months will show a considerable volume of business.

# \$48,000 Damages in Perlman Case

## Munger Victorious in Long Litigation

### Similar Suits Pending Against Firestone and Goodrich Rubber Companies

NEW YORK, Sept. 12—The Federal Court of Appeals for the second circuit has handed down a decision granting \$48,000 damages to Louis D. F. Munger in his patent litigation against the Perlman Rim Co. which has been in the courts several years. After the validity of the Munger patent had been sustained in the higher Federal courts the master who heard the evidence decided that Munger was entitled to \$72,000 damages. The defendant then appealed on this point and the Circuit Court of Appeals cut the amount of damages to \$48,000.

#### Other Suits Pending

Munger has similar suits pending against the Firestone Tire & Rubber Co. and the Goodrich Rubber Co. They were filed several years ago but have been held in abeyance pending the result of the suit against the Perlman Rim Co. Now that damages have been assessed in the original action the other suits will be pressed, according to W. A. Redding, attorney for the plaintiff.

The Munger patent expired on Dec. 5, 1916, but suits for infringement can be filed up to Dec. 5, 1922. Damages for the use of the patent which it is alleged has been infringed can be assessed, however, only for a period of five years prior to the filing of the suits. It was said to-day at the offices of Redding that no suits would be started against automobile manufacturers and that no litigation is contemplated beyond that which is now pending.

#### Years in the Courts

The affairs of the Perlman Rim Co. have been in the courts for years and constitute one of the most dramatic and romantic chapters in the line of litigation connected with the automotive industry. Munger came into the case several years after the Perlman Rim Co. had established the validity of the patent covering the collapsible rims in question. The validity of the patent had been sustained in a suit brought against the Standard Welding Co. by Louis Perlman, and all Munger had to do was to establish his ownership of the patent.

Louis H. Perlman was the first to sue for infringement of the rim which now bears his name. The action was brought against the Standard Welding

Co. and was successful. Judgment was obtained against the company for a very large sum and the plant was closed. Not enough rims were being manufactured to meet the demand and W. C. Durant organized a company of which Perlman was president to go into production. This was known as the Perlman Rim Co. The company took title to the patent and also took over the Standard Welding plant under the judgment which had been obtained.

When the United Motors Corp. was formed by Durant it took over the Perlman Rim Co., giving two shares of United Motors stock for one share of Perlman Rim.

When the assets of the Perlman Rim Co. were taken over by United Motors it is understood they assumed all the obligations of the company which they absorbed, and the same was true of United Motors when it was taken over by the General Motors Corp. If this contention by the attorneys for Munger is correct, the General Motors Corp. will be responsible for his judgment.

After his success in the original suit, Perlman brought action for infringement against the Firestone Tire & Rubber Co. This suit was withdrawn, however, before presentation of the evidence had been completed.

#### Munger Had Patents

At the time the Perlman patent was sustained, Munger had in his possession a collection of patents, and he alleged that one of them covered the Perlman rim. He sued for infringement and before the case came to trial the Perlman action against the Firestone company blew up. Several years had elapsed after Munger obtained his patent before he filed suit against Perlman. When his case went to trial, Munger was asked to explain why he never had manufactured under his patent. He asserted that he had made numerous efforts to do so and had formed several companies but that all of them had failed because of lack of capital.

While the trial was under way, a Philadelphia junkman bought all the assets of the latest of the Munger companies, and the Perlman attorneys contended that the purchase included the rim patent. They went to the junk dealer and obtained an assignment of the patent from him.

When this assignment was presented to the court, Munger produced a contract he had made under which the patent was to be assigned to his company provided a certain amount of capital was invested in it. He showed that this capital was not forthcoming and that failure of his company resulted. For that reason his contention that the patent was not included in the purchase of the junkman was sustained and he won his suit for infringement.

## Workers Benefit by Ford Price Cuts

### Hundreds of Unemployed Will Work in Parts Plants Now Speeding Up

DETROIT, Sept. 12—Reduced prices in Ford cars and trucks followed a series of negotiations between the company and the companies supplying it with parts, by which new price arrangements were made in practically all cases and orders placed ahead for several months' supply.

Under the stimulus of this business all of these parts suppliers are now operating on an increased schedule, giving work to many men who have been listed among the unemployed for months, and in some cases overtime is being indulged in until the pressure of business is brought to a point where it can be met by regular daily operations.

Many departments of the Ford company which had run ahead of the assembly branches in the latter part of August are now resuming full time operation. Assembly has been at maximum speed since April, but despite this some of the factory departments have from time to time run ahead of actual car production, necessitating temporary layoffs.

In a great many of the factories here orders for some time past have actually warranted an increase in production, but this has been steadily countermanded in an effort to hold operations to a steady day-to-day basis. Under the pressure of continued orders, however, several of these factories are adding daily to their employee organization and are preparing to go into increased production.

## D. L. Morgan Succeeds Batchelder in A.A.A.

NEW YORK CITY, Sept. 12—D. L. Morgan, business man of New Haven, Conn., was to-day appointed chairman of the executive board of the American Automobile Assn., succeeding Amos G. Batchelder, who held the position for many years and who was killed in an airplane accident in Maryland last May.

Morgan will devote his entire time to the work and will be located in the headquarters in Washington, D. C. He has been closely associated with motor affairs for eight years. For six years he was with the Lackawanna Motor Club, Scranton, Pa., and for the past two years, while living in New Haven, has organized the Automobile Club of New Haven. In business he has been associated with Bradley-Smith Co., confectionery manufacturers.

## Revenue Bill Study Taken Up by N.A.C.C.

### Tax Committee Gives Close Consideration to Sections Affecting the Industry

NEW YORK, Sept. 12—The tax committee of the National Automobile Chamber of Commerce is giving close consideration to three sections of the revenue bill now before the finance committee of the Senate to which little attention has been paid previously by the automotive industry.

One of these relates to the manufacturers' excise tax. When the law was first put into effect in 1917 it was construed to cover not only sales at wholesale but retail sales made through factory branches. Remedial legislation was enacted in 1918 to relieve wholesalers of the payment of a retail tax, but this paragraph of the law was omitted in the present House bill, and unless an amendment is made by the Senate, the situation will revert to that which prevailed in 1917.

Another section of the law which would add materially to the bookkeeping burdens of manufacturers provides that every employer must make a report on every employee, whose rate of pay per hour would provide an annual income in excess of \$1,000. This would make necessary a report on all kinds of casual labor and would materially increase bookkeeping costs.

The third section to which exception is taken is that relating to the excise tax on tires and automobiles. Although the framers of the measure declare that no change is intended, the phraseology is somewhat different and it is held that new phraseology must always be interpreted and that in consequence it might lead to misunderstanding and inconvenience.

These questions will be taken up with the finance committee if a hearing can be obtained. Letters on the subject now are being sent to individual Senators.

### TEMPLAR CARS DOWN

CLEVELAND, Sept. 12—Another cut in prices of \$400 is announced by the Templar Motors Co. The open models have been reduced from \$2,385 to \$1,985 and the closed models from \$3,185 to \$2,785. The open cars now cost \$900 less than on June 30 and the closed cars \$1,000 less.

### MOON CUTS THIRD TIME

ST. LOUIS, Sept. 12—The Moon Motor Car Co. announces its third price reduction, effective immediately. The prices now are \$600 lower than last fall. They are based on 1914 labor, material and overhead costs. The open models have been cut \$200 to \$1,785 and the closed models \$200 to \$2,785.

### ONE HORSE TO 372 MOTOR CARS AT CONNECTICUT POINT COUNT SHOWS

HARTFORD, CONN., Sept. 12—A count of vehicles made by the State Highway Department for the National Highway Assn. shows, among other things, the remarkable decrease of horse-drawn vehicles. Figures announced to-day, taken at a point in Thompsonville, between this city and Springfield, on the State highway built to meet interstate motor traffic, include 28,039 passenger automobiles, 2395 motor trucks, 334 motorcycles and 83 horse-drawn vehicles, for a certain period of time. This is about one horse to 372 motors.

The count made was one of many initiated by the national association to secure information for use in road building. The men making it noted the character of the trucks, direction of travel, size of tires, freight, and weight on axles. The work was done with the least inconvenience possible to drivers.

Notice was issued before it started to explain that the inspectors were not stopping vehicles to look for liquor nor were questions asked for any ulterior motive.

## Hendee Motorcycle Prices Reduced 22½%

SPRINGFIELD, MASS., Sept. 12—The Hendee Mfg. Co. announces a reduction of 22½ per cent in the prices on 11 lines of motorcycles. They are effective immediately. The company is bringing out a new machine called the "Indian Chief" which will sell for \$435. The report of the company for the fiscal year ended Aug. 31 shows that more than \$900,000 of bank loans were paid off during the year and that current liabilities aggregate only \$200,000 contrasted with about \$4,000,000 of current assets.

### VIM TRUCKS DOWN

NEW YORK, Sept. 12—The Standard Steel Car Co., which now owns the Vim truck, has announced the following new prices:

Model	Old Prices	New Prices
Vim 29.....	\$1,355	\$1,050
Vim 30.....	1,550	1,175
Vim 31.....	2,475	1,975

### BELL TRUCKS DROP

OTTUMWA, IOWA, Sept. 12—A general reduction in the prices of Bell trucks, effective at once, has been announced by the Bell Truck Sales Corp., sales division of the Iowa Motor Truck Co. The prices follow:

	New Prices	Old Prices
Model M 1 ton.....	\$1,495	\$1,650
Model E 1½ ton.....	2,100	2,250
Model O 2½ ton.....	2,550	2,750

## Cleveland Makers Report Increases

### Federal Survey Also Shows Greater Demand for Cars Since August 15

CLEVELAND, Sept. 12—Statements by various local makers of automobiles to the effect that the demand has increased gradually since August 15 is borne out by a report of the committee on labor relations of the Chamber of Commerce, on the employment condition in Cleveland. This report was prepared for the United States Department of Labor.

The survey shows that industrial conditions in this city have improved over July, while the retail merchants' board of the Chamber of Commerce has learned that retail buying is on the increase in practically all lines. The retail automobile trade is taking the lead, however, and the large cuts made in the prices is said to be responsible.

The survey of employment disclosed that there has been an increase of 1.5 per cent in the number of employees in August. The concerns covered in the survey number 99, and they are representative of all industries.

Automobile makers reported an increase in employees on Aug. 31 of 2.9 per cent over the last day of July. Iron and steel products are moving more freely in this district, and as a result there was an increase of 3 per cent in employees; food and kindred products show an increase of 7.9 per cent; paper and printing 3.9 per cent; textiles and their products 2.2 per cent; chemicals and allied products 3.9 per cent. The following industries reported losses as indicated: Lumber and its manufacture 6.3 per cent; metals and metal products other than iron and steel 2.4 per cent, and miscellaneous 1.5 per cent.

Railroads in this section are hauling more freight than they have in months. All the trunk lines are putting back trains that were taken off the schedules months ago.

### WICHITA TRACTOR CUT

WICHITA FALLS, TEXAS, Sept. 12—Wichita Motors Co. has announced a price cut of \$500 on the Wichita tractor, Model T. It will now sell for \$2,000.

### MAURITIUS A GOOD MARKET

LONDON, Sept. 3 (By Mail)—The 400,000 people in Mauritius are very well off and the motor vehicle is becoming more essential to them every day. For tilling the ground only very strong tractors can be used as the soil, though extremely fertile, is very stony. There is some talk of electrifying the island's railroads, but in an island 36 miles by 24 the motor truck is obviously the best means of transport.

## Insurance Risks Greater in Cities

### Some Few Companies Escape Losses by First Investigating the Owners

NEW YORK, Sept. 12—Discussing the automobile situation, which "continues to be the chief source of worry to the officers of many of the fire insurance companies," the New York Journal of Commerce says:

"Here and there is found a company which is not doing any serious worrying. These are mostly institutions which have not sought a large volume, but have applied to the automobile business the same methods they used in underwriting other classes. Realizing that the hazard was in the owner rather than in the car, they have investigated the owners through the "Fire Record," mercantile agencies and various reporting agencies and have kept off their books a considerable business which is now presumably causing sorrow to some of their competitors. They are having more than a normal loss ratio, but they have not to blame themselves for want of care.

"One noteworthy feature of the automobile situation is the fact that it is so much worse in large cities than in the country and smaller places. After making due allowance for the greater prevalence of crime in large cities, there is still ground for the belief that the better experience in the smaller places is due in part at least to the fact that the agents who underwrite the business know the assured, while in the large cities the underwriter as a rule knows only the broker who presents the risk.

"A wide difference of opinion exists as to the value of inspections on assured. One official says that his company has had excellent results from the Retail Credit Co.'s investigations. An officer of another company says it has secured more satisfactory results through other agencies. Still another company uses the mercantile agencies first because their reports cost less, and then the Retail Credit Co. later, if necessary. That the system of getting reports on owners of cars is growing is evidenced by the expansion of this branch of the business of the Retail Credit Co. Vice-president Walter C. Hill of that company writes:

"It is only within the last few months that fire insurance companies have been making anything like regular or systematic use of inspection information. During that time we have opened with nearly a hundred fire companies accounts for investigating automobile fire risks. This includes practically all the big companies. We have never handled any line of reporting in which there is such a large per cent of unfavorable reports. One company has us make a review of all their auto fire business in Kansas City and found it necessary to cancel 17 per cent of the risks on their books. Similar reviews have been made in other communities with approximately the same results."

### DRAGON UNDER INQUIRY

CHICAGO, Sept. 12—Alleged misuse of the United States mails and violations of the State blue sky laws by the Dragon Motors Corp., a concern capitalized at \$1,000,000 are being investigated by Federal and State authorities.

### Newest Car on French Roads

A "windwagon" of recent French construction. The La Traction Aérienne is a closed machine seating two persons in tandem and is equipped with a two cylinder aircooled engine of 3.5 by 4.7 in. cylinder dimensions. Vehicles of this type are permitted on French roads provided the propeller diameter does not exceed the maximum width of the vehicle and the propeller is properly protected. The machine weighs 520 lbs.

### Willard Now Making All-Rubber Batteries

CLEVELAND, Sept. 12—No wood enters into the construction of the new all-rubber battery now being manufactured by the Willard Storage Battery Co. The plate assemblies are contained in compartments which are formed by rubber dividing walls which are integral with the molded rubber case. Thread rubber insulation is used. The sizes in which this new battery is being produced and the retail list prices are as follows:

6-volt, 11 plate.....	\$47.30
6-volt, 13 plate.....	53.90
12-volt, 7 plate.....	61.95
Ford size.....	35.00

The price on the Ford size of the new battery is the same as for the thread rubber battery for Fords with wooden case.

### INTRODUCE "VAUGHN" CAR

GREENSBORO, N. C., Sept. 12—The American-Southern Motors Corp. is officially introducing its new model, the Vaughn, to the public at the "Made in Carolinas" Exposition this week. The new car has been put to rigid tests the past few months, and the manufacturers are greatly pleased with the showing made. Hiram M. Browne is designer of the new car and he has just given it a 3000-mile drive, having no trouble on the trip. Actual running time was 98 hr. 20 min., an average of 31.58 miles an hour. Gasoline consumption was 13 3/4 miles per gallon of fuel consumed, weight carried 4950 lb. This car will be presented in two models, a sporting touring car and racing roadster. Another type of the Vaughn will be a family car, presented in three models.

### N. I. V. A. TRACTOR SHOW

CHICAGO, Sept. 12—Offices have been opened in the headquarters here of the National Implement and Vehicle Assn. to take up the preliminary work in connection with the seventh national tractor show and educational exposition which will be held on the Minnesota State Fair Grounds at Minneapolis Jan. 30-Feb. 4.

### Stockholders Finish Immel Reorganization

COLUMBUS, OHIO, Sept. 12—The reorganization of the Immel Co. of Columbus has been completed by the committee of stockholders, which bought up the plant and all materials recently at receiver's sale. Recently the Buckeye Body Co. of Columbus was chartered under the laws of Ohio with an authorized capital of \$1,000,000.

The incorporators are A. G. Gilmour, J. W. Dinsmore, F. E. Kocher, G. P. Hinkle and Willard Miller. The incorporators are members of the stockholders' committee with the exception of the last named who is an attorney. The board of directors consists of J. W. Dinsmore, F. E. Kocher, G. P. Hinkle, A. G. Gilmour, V. W. Moss, J. G. Goeller and C. W. McFarland. J. W. Dinsmore is president, F. E. Kocher vice-president, and G. P. Hinkle secretary-treasurer. The company will soon start active operations at the plant, and a contract with the Velie company will likely be revived.

### RICE ADDRESSES M. A. M. A.

DETROIT, Sept. 14—H. H. Rice, president of the Cadillac Motor Car Co. and treasurer of the National Automobile Chamber of Commerce, will discuss business conditions in the automotive industry and prospects for the future at the meeting to-day of the credit convention of the Motor and Accessory Mfrs. Assn. Theodore H. Price, editor and publisher of Commerce and Finance, will address the convention to-morrow on the subject, "Why I Have Faith in the Automotive Industry."

### NEW FORD DEALERS IN MEXICO

HOUSTON, TEX., Sept. 12—The Ford Motor Co. of this city has signed up the Robertson Motor Co. of Mexico City as its third dealer in the Federal district of Mexico. New dealers also have been placed in Guadalajara, Zacatecas, San Geronimo, Saltillo and Torreon.

## 2500 Workers Back at Overland Plant

### On Road to Conditions of 1916, President Willys Says in Statement

TOLEDO, Sept. 12—More than 2500 men were put back to work this week by the Willys-Overland Co., at the local plant and 2000 were recalled at the Willys-Morrow plant at Elmira, N. Y. The latter plant makes parts for the Overland automobiles. John N. Willys announced here this week that production would be doubled and more men put back to work.

In the last month reductions have been made in the working forces as the selling activities of the company slackened but with the third price reduction announced last Saturday in effect sales boomed so that a reaction was necessary at the plants.

"I am devoting practically all of my time to Overland in field sales work among the dealers," said Willys, who was in the city this week for a conference with Walter P. Chrysler, executive vice-president and divisional sales manager.

"We have a very satisfied lot of dealers. Personally I believe we are on the road back to conditions as they existed in 1916. Willys-Knight sales have shown a greater increase by three times than have Overland sales."

The first three days following the announcement of the price cuts brought in sales of 3,100 cars and the fourth day before noon 435 orders were booked.

Willys said he was especially pleased with the progress at the factory and the management of Vice-President Charles B. Wilson.

The agricultural fields are looked to for a great buying increase this fall. The harvesting of crops and the lower prices for automobiles will give great impetus to the farm sales, is the opinion of the Willys leaders.

Toledo sales have shown a large increase during the week, according to Leroy Peed, manager of the Willys-Overland, Inc., here.

"We feel that we can make a new record this fall," he said.

L. J. McCracken, who recently established a sales record for Overlands at Bridgeport, Conn., will assume management of retail sales for Toledo, succeeding Lewis P. Kinsey, on Oct. 1. Kinsey, who has been long identified with Overland, is leaving the motor field.

McCracken was formerly in the New York sales office of Willys-Overland.

With the development of new sales policies and the pick-up in sales the last week more activity is reflected in the automotive subsidiary plants here including the Electric Auto-Lite Corp., Tillotson Carburetor Co., Mather Spring Co.

The movement of Willys engineering forces to Toledo has been completed. W. S. Fisher, who has charge of design-

ing Knight motors at the Elyria plant, is now located with his assistants here under E. H. Belden, chief engineer for the company.

The entire sales situation was reviewed at a conference here this week attended by Willys, Chrysler, Charles LeRoux, Minneapolis, northwestern division manager; Walter Wright, southern division manager; R. H. Butler, central division manager; and W. L. Colt, New York, eastern division manager.

## O. T. Pearson Becomes N.A.C.C. Staff Member

NEW YORK, Sept. 12—O. T. Pearson has been added to the staff of the educational department of the National Automobile Chamber of Commerce to develop work in economic research. He was a graduate of the University of Michigan and did graduate work at Carnegie Institute of Technology.

Pearson has had a wide experience in research work and his addition to the staff of the N. A. C. C. will permit branching out along new lines. A bulletin will be issued regularly summarizing general business conditions in relation to the automotive industry. This is designed to supplement the work of factory sales departments in economic investigation. The bulletin will be of general interest to the industry and especially to the smaller companies which cannot afford to conduct such a department for themselves.

## Portage Stockholders Arrange Stock Issue

BARBERTON, OHIO, Sept. 12—Stockholders of the Portage Rubber Co. have made plans for reorganization and refinancing under new management by the issuing of \$1,000,000 in first mortgage sinking fund bonds. Present stockholders will be given first chance to purchase these bonds which will bear 8 per cent interest. The present common stock which has no par value with be withdrawn and new common issued. Creditors of the company and those with which it has fabric commitments will be asked to accept the mortgage bonds. It is expected that E. A. Tinsman, former manager, will be elected vice-president and general manager.

## Change Date of Meeting for Service Managers

NEW YORK, Sept. 12—The convention of factory service managers to be held under the auspices of the National Automobile Chamber of Commerce will be held Nov. 15 and 16 instead of Nov. 22, as tentatively planned, as this latter date comes too close to Thanksgiving Day. A questionnaire has been sent to members asking for suggestions as to subjects to be taken up at the convention and it is probable that arrangements will be made to conduct those delegates who are interested through local factories and service stations.

## Trade Conditions Better in Canada

### A. I. C. Convention Shows Industry Has Demonstrated Stability—Future Is Assured

TORONTO, Sept. 9—At the annual meeting of the Automotive Industries of Canada (the N. A. C. C. of the Dominion) was held in Toronto, reports showed that conditions had been better than anticipated, that the products of the industry had enjoyed a better sustained demand than those of many other industries, thereby demonstrating their stability and the fact that the service they gave was needed and that conditions were bettering and the future assured were the outstanding general opinions expressed. The following excerpts from the "Annual Review" are of interest:

"Statistical data supplied by members of our association show that during the year 1920 a total of 97,868 motor vehicles were manufactured by ten companies belonging to the Automotive Industries of Canada. These companies had a capital investment of more than \$43,000,000 and their production values totaled \$93,880,864. The figures for the entire industry showed a total of 21,940 employees at the busiest season, a total of \$23,826,240 paid in salaries and wages, a capital investment of \$87,158,869 and a production value of \$157,120,337 for the year 1920.

"In addition there were in 1920 a total of 5522 automobile dealers with 43,094 employees to whom \$56,022,200 was paid in wages. The total capital invested by dealers was placed at \$44,176,000.

"The number of persons dependent on the automotive industries is shown in the chart as 87,760 and the number of dependents on the retail trade 194,464, a grand total of 282,224 dependents on the manufacture and sale of motor vehicles in Canada."

(These figures do not include service or gasoline stations, garages or repair depots. Were these included it is estimated that the total would be swelled to approximately half a million dependents.)

The 1920 board was re-elected with the exception of W. A. Eden of the Dominion Rubber System, who succeeded R. E. Jamieson of the same corporation. R. S. McLaughlin, president, General Motors of Canada, Ltd., was re-elected president and W. T. Sampson, general manager, Gananoque Spring and Axle Co., Ltd., vice-president.

## SUNDRIES FIRM BANKRUPT

NEW YORK, Sept. 12—Schedules in bankruptcy have been filed by the Automobile Sundries Co., Inc., of this city. Liabilities are listed at \$80,026 and assets at \$60,789. The principal creditor is the Champion Spark Plug Co., which has a claim for \$29,506.

## New Firm Will Sell Reimported Trucks

**Slough Trading Company Formed  
to Dispose of 1,000—Only 70  
Sold**

NEW YORK, Sept. 12—The Slough Trading Corp. of America has been organized as representative in the United States of the Slough Trading Corp., Ltd., of England to dispose of approximately 1000 former American army trucks purchased of the allied governments and sent here for re-sale. W. O. Crabtree, who has been well known in New York for several years as truck dealer, is general manager of the corporation which is seeking dealer representation throughout the United States.

The trucks include Mack, Pierce-Arrow, White, Packard and Riker and range in capacity from 3½ to 5 tons. They will be sold as reconditioned vehicles at approximately one-half the list price of similar new trucks.

The Slough Trading Corp. of America succeeds previous representation of the British company. It will handle only the distribution of trucks, selling through local dealers in New York as elsewhere.

Speaking of the project, Crabtree stated his opinion that the truck business in the United States cannot be put on a sound basis until these reimported trucks, which the entire business community knows are here and will be sold sometime, have been disposed of. Up to date less than 70 of the Slough reimportations have been sold and Crabtree feels that uncertainty will prevail in the truck market until the balance of the 1000 vehicles are put in the hands of users.

Crabtree makes no claim that the trucks are "as good as new," stating frankly that some have been operated and others have suffered sufficient deterioration in shipment and storage to necessitate reconditioning.

## Ford Plans Car Shops Along His D., T. & I. Road

SPRINGFIELD, OHIO, Sept. 12—After an inspection of the local property of the Detroit, Toledo & Ironton Railroad by Henry Ford, its owner, he said he plans eventually to locate car shops at convenient points along the road so that rolling stock can be repaired without keeping it out of service for long periods. He added that he expects to develop a new type of freight engine to be used on the road.

Intimation that Ford contemplates entering the river shipping business was seen in his statement "that the Ohio River is navigable the year round and business can be handled to and from the South by water. The use of water transportation is coming back and will be developed more thoroughly in the future."

Ford has been asked to purchase the

defunct Missouri & North Arkansas Railroad when it is sold at public auction next month. The road is 364 miles long and extends from Joplin, Mo., to Helena, Ark., passing through a heavily timbered country containing large deposits of manganese. Ford has not indicated whether or not he will bid for the property.

## Canada Gets Gasoline Supply from Roumania

WASHINGTON, Sept. 12—Gasoline is being brought from Europe to Canada and arrangements are likely to be made for a continuous supply from Roumania, according to a report received from Consul Felix S. S. Johnson, Kingston, Can. This gasoline is being sold at service stations in Montreal at a price of one cent per gallon less than the prevailing retail price, and arrangements are said to be under way for a continuous supply by tank ships from the same source. Establishment of this trade with Roumania will in a measure offset the indebtedness of that country to Canada as the result of war loans.

It will be somewhat unique for Canada to obtain her supplies of gasoline from Europe as many interesting points are involved, such, for example, as the quality of the product, the consul states, in view of the existing Canadian tariff which seeks to bar out high grade gasoline as a protective measure and also as to the effect on prices in Canada of such importations.

## Car and Cycle Clubs Plan British Race

LONDON, Aug. 31 (By Mail)—The Junior Car Club, which was founded in 1912 as the Cycle Car Club, will conduct a 200 mile race on the Brooklands track, Oct. 22. It will be open only to members of the club, but will be held under the rules of the Royal Automobile Club. The race is divided into two classes for motor propelled vehicles. The first class will be for cars under 67.2 cu. in. and class two for cars between 68 cu. in. and under 91.5 cu. in. The race will be the first of its kind ever held in England. Fifty-one cars have been entered, representing 27 makes, of which 13 are in class one.

## Steel Treating Men Will Witness Races

INDIANAPOLIS, Sept. 13—The Indianapolis Motor Speedway Co. has offered the use of the speedway track for the entertainment of delegates and members at the convention of the American Society for Steel Treating on Sept. 21. A 100 mile race has been planned and a two mile match contest between two cars owned by Arthur Chevrolet will be features of the day. Drivers who will take part in the races are Jimmie Murphy, who won the French Grand Prix; Howdy Wilcox, Roscoe Sarles, Benny Hill and Eddie Hearne.

## Duplex Truck on 50% Production Basis

**Company Expects Soon to Run at  
Capacity—Sales Have Been  
Good**

DETROIT, Sept. 12—Operations at the Duplex Truck Co. factory, Lansing, have increased to a 50 per cent basis through the development by the company of the possibilities of its 1½ to 2 ton chassis for passenger bus service in meeting transportation problems in many parts of the country.

Though not confining itself to the production of this one chassis exclusively, the company is going after this business aggressively and declares that with present prospective business taking form it will soon be back to practically 100 per cent operation.

The business is sought out by its investigators in the field operating under the vocational sales plan. Where an opportunity for bus transportation is reported the dealer in that territory is asked to investigate further. If conditions are regarded as favorable for actual bus trial, one or more are put into service and the possibilities of the proposed line tested out. Where the institution of a line follows trial the sale is made through the territory dealer.

Recent business developed by the company includes the sale of 16 additional buses to a fleet of 14 which has been operating in Washington, D. C. A line is operated between Elkhart and South Bend, Ind. Trial buses are in operation in a number of cities with excellent prospects of developing permanent lines.

## Champion Porcelain Company Organized

TOLEDO, Sept. 12—The Champion Porcelain Co. has been organized here by the Champion Spark Plug Co. to take over the business of the Jeffery DeWitt Co. of Detroit. The new corporation is capitalized at \$750,000 under the laws of Michigan.

For many years the Champion Spark Plug Co. held an interest in the Detroit concern which manufactured insulators exclusively for Champion. Recently a deal was consummated whereby the Toledo company gained complete ownership of the Jeffery firm. The Champion Porcelain Co. is a subsidiary of the spark plug company. Dr. J. A. Jeffery is president of the new corporation and is known as a leading ceramic engineer.

## LOUIS F. KAUFMAN DIES

INDIANAPOLIS, Sept. 13—Louis F. Kaufman, 67 years old and for several years manager of the service department of the Midwest Engine Co. of this city, died at his home here following an illness of many months. Surviving him are a widow, one son and a brother.

## Durant of Canada to Make Own Tires

**In Fact Every Part Used Will Be  
Manufactured at Leaside  
Factory**

NEW YORK, Sept. 12—Preparations are being made for the incorporation of Durant Motors of Canada, Ltd., for which a plant at Leaside, near Toronto, was purchased last week by W. C. Durant. Plans for the Canadian company have not been completely developed but they have been so far formulated that it can be said they are of great importance from the viewpoint of the Durant enterprise.

The plant which has been purchased was erected by the American Government for a munitions plant. It was completed almost simultaneously with the armistice and never was occupied. The site includes 18 acres and plans already have been made for the erection back of the present building of a three story assembly plant 600 feet long and 130 feet wide. The building which has been purchased will be used for the manufacture of motors, axles and differentials. There also will be erected a woodworking plant for the construction of bodies. It also has been learned that the Durant interests will manufacture in Canada the tires which will be used on the car made there. In fact every part used will be made in Canada including the electrical equipment.

While no official information is obtainable at Durant headquarters, the natural inference is that if all the parts which go into the Canadian car, including tires, are to be made by Durant, the same procedure ultimately will be followed in this country. The Canadian plant will be put in operation next March with a capacity of 100 cars a day. Durant four will sell in Canada for \$1,280 f.o.b. Toronto. The price in the United States is \$890.

The Durant four already is in production at the Long Island City plant and a few already have been turned over to purchasers. Production will be increased steadily.

Marked progress is being made in redesigning the Sheridan which will be known as the Durant six. The body lines will be similar to those of the Durant four.

## Anglo-American Motor Settles on Plant Site

TRENTON, ONT., Sept. 12—The board of directors of Anglo-American Motors, Ltd., has finally closed with the town of Trenton for a site for its plant, where it will build the "La Marne" car. This means a boost for industry in Trenton, as the factory will be a large one, employing several hundred men. The company will manufacture two types of automobiles—a four and an eight cylinder model, both with closed bodies. The car will be Canadian-built throughout,

and the manufacturers claim that the price will be less than any car of the same size and quality now being made in Canada.

They propose to sell the small four cylinder car for \$975, and the eight for \$3,000. If this can be done, the car should have a huge sale when it is put on the market. Construction work on the new plant will be started in the course of the next few weeks, and the machinery will be installed as the work progresses. The head office of the Anglo-American Motors is in Toronto.

## Rural Buying Gains in Indiana District

INDIANAPOLIS, IND., Sept. 12—The Indiana farmer is buying trucks. He also is buying tractors. And with some other folks he is buying passenger cars. And this is in face of the very discouraging stories circulating about Indiana crops in general, and despite the particular story that the Indiana farmer will have to buy potatoes for his own use and at a rather high figure. Exhibitors at the Indiana State fair last week, after the first three days, were trying to outboast one another on the amount of automotive equipment sold. Boiled down to even 25 per cent of their face figures, these boasts indicate something of a record run of business for the fall motor show, the twenty-third annual event staged by the Indianapolis Automobile Trade Assn.

Departing from the old "still" exhibits, the tractors and some of the trucks gave power demonstrations, control and flexibility trials. And the answer was found in the difference between the interest of the small "lookers" in the still show inside, and the "questioners" in the close packed groups at the motion show under tents and in the open.

## California Has Heavy Registration Total

INDIANAPOLIS, IND., Sept. 12—The registration of motor vehicles from Jan. 1 to Sept. 1 was 42,053 more than was registered with the Secretary of State all last year, H. D. McClelland, superintendent of the automobile division in the State office, has announced. The eight months' registration of passenger cars was said to be 35,622 more than the entire 1920 registration of such cars. The truck registration in the eight months exceeded the entire 1920 truck registration by 6,431.

## FEDERAL TRUSTEE NAMED

WESTFIELD, MASS., Sept. 12.—Loring P. Lane of this city has been appointed trustee in the estate of the Federal Corp., local manufacturers of automobile accessories, as a result of the first hearing of the corporation's creditors before Referee Charles W. Bosworth in bankruptcy court at Springfield. The liabilities of the corporation are listed at \$282,908.27 and the assets are placed at \$62,544.08.

## Cadillac Back on 20,000 a Year Basis

**Production Schedule Now Represents Practically 100 Per Cent of Capacity**

DETROIT, Sept. 10—Cadillac Motor Car Co. has resumed production on a schedule as great as that of last year, it was announced at a convention of Cadillac's 100 distributors at the factory this week. In 1920 annual production was on a basis of 20,000, representing practically 100 per cent capacity.

"Indications from all parts of the country," said H. H. Rice, president and general manager, addressing the convention, "show generally improved conditions affecting the purchase of motor cars. Business men can look for a more receptive mood from the buying public from now on. We believe the bottom has been reached and that real recovery is actually in progress almost everywhere."

The distributors were taken on an inspection trip through the new plant and were much impressed with the company's preparation for better business. In their remarks it was indicated that complete confidence dominated the sales organization of the market awaiting the Cadillac fall offerings.

## Parker Motors Leases Montreal Plant Space

MONTREAL, CAN., Sept. 12—The Parker Motor Car Co., capitalized at \$10,000,000, has leased factory space sufficient to provide for the assembly on a considerable scale of its car which will be called the Royal Six. It is understood operations will be started the last of this month. The company has completed negotiations with the Canadian Motor & Machine Co., Ltd., at Quebec whereby it will take over the plant of the latter company to establish a distribution and service center for eastern Canada. Small units eventually will be manufactured in the Quebec plant.

## W. A. Paterson, Pioneer of Industry, Dies at 83

FLINT, MICH., Sept. 12—Through the death of William A. Paterson the automotive industry has lost one of its pioneers. He was the founder of the W. A. Paterson Co., manufacturer of carriages since 1869 and manufacturer of the Paterson automobile since 1908. Paterson was born in Fergus, Ont., in 1838. He came to Flint in 1869. The carriage business was discontinued in 1910, two years after his advent in the automotive field. Affiliated in the company with him were W. C. Paterson and W. R. Hubbard. Business will be continued along existing lines and no action will be taken at present in regard to a successor to him as president of the company.

## 1922 Cadillac Will Have Many Changes

### Improvements in Body, Chassis and Powerplant—New Model in Production

DETROIT, Sept. 15—Changes in body, chassis and powerplant are incorporated in the 1922 Cadillac. Refinements throughout have been designed to produce a lower car of better riding qualities, enhanced appearance, increased efficiency in performance, particularly in cold weather, and superior appointments in both the closed and open bodies. The price remains unchanged. The factory is already in production on the new model and shipments have commenced.

#### Lower Appearance

Probably the most striking difference between the new cars and the old is the lower appearance, which is secured by the use of smaller wheels using 33 by 5 in. cord tires, and by the use of the longer wheelbase for some of the body types. All Cadillacs are now mounted on the same 132 in. wheelbase chassis. Former models varied the wheelbase with the body, using considerably shorter lengths for some of the open cars. A higher radiator, larger hood, and new design head lamps are provided.

Some mechanical changes of considerable importance are incorporated. Probably the most noteworthy of these is a new carbureter designed for better economy. It has a 2-in. intake and employs a thermostatically controlled spring on the auxiliary air valve, which is designed to provide temperature compensation in the regulation of the mixture. The action of the throttle pump is also controlled by thermostat to provide a richer mixture for acceleration when the engine is cold. Both these improvements are claimed to be helpful in reducing the warming-up period.

The oiling system has been simplified by doing away with the camshaft bearing feed pipe and allowing the oil to circulate through the center of the hollow shaft. This gives a cleaner design and takes care of not only the camshaft bearings but also the front end driving chains and the air pump for the gasoline system. Lubrication of the chassis is improved by the installation of piston type grease cups capable of introducing lubricant under 400 lb. per sq. in. pressure and thus keeps a constant supply of lubricant in contact with the bearing. No lubrication is now required on the bushings for the clutch and brake pedal shafts, and a number of other points where the installation of bronze bushings with graphite inserts has been found practicable.

#### Changes for Comfort

Most of the remaining chassis changes are of a more detailed nature and do not so materially affect the performance of

the car, but rather its period of useful life and comfort. A choice of gear ratios is now provided. The standard ratios are 4.50 to 1 and 4.90 to 1, but if desired there is also a 4.15 to 1 which can be secured on the phaeton or roadster.

Other detail changes on chassis include such conveniences as drain cocks on the bottom of each water pump accessible from above the frame, by means of long shaft connections. One particularly noteworthy point is that the road clearance has not been decreased although the car is lower. This has been accomplished by decreasing the size of the rear axle gear housing, which is the low point of the chassis.

In the bodywork and fittings there are a great many important refinements which result in better appearance and more comfort. The steering wheel, for instance, is now made of selected walnut, including the spokes. The horn button also is of the same wood and the tilting feature, which is no longer regarded necessary, has been eliminated. The long spark and throttle levers have been replaced by a more compact arrangement which eliminates the sector and brings these control features closer in to the steering column. Only the finger grips of the new levers are exposed.

#### Instrument Board

The new instrument board is distinguished by its beauty of design and brings together all of the dash equipment in one assembly. All the devices on the instrument board are retained by thumb nuts to facilitate removal. The pedal pads are duralumin forgings and consequently non-rusting. To keep the clean design desired in the front compartment, the pedal adjustments have been discontinued.

There is a transmission lock fitted by the same key as the switch lock and the tire lock. The ventilator is larger and more easily operated; the windshield frame has been strengthened and a leather covered visor is used on the enclosed cars. The phaeton and five-passenger sedan are provided with trunk racks which fit between the tire carrier and body.

#### Design Remains Same

The fundamental specifications of the Cadillac and the basic features of the design remain the same as in the past with the changes noted herewith. The eight-cylinder V engine, which is now in its seventh year of manufacture with modifications made from time to time, is continued. The bodies supplied are ten in number and are listed with their prices herewith:

Phaeton .....	\$3790
Roadster .....	3790
Touring car .....	3940
Two passenger coupe .....	4540
Victoria .....	4540
5-passenger coupe .....	4690
Sedan .....	4950
Suburban .....	5190
Limousine .....	5290
Imperial limousine .....	5390

## Plan to Reorganize P. O. Transportation

### Postmaster Hays Intends to Increase Efficiency by Use of Motor Trucks

WASHINGTON, Sept. 14—Reorganization of the motor transportation system in the Post Office Department has been authorized by Postmaster General Hays. He has designated Ralph H. Matthiessen, president of the Motor Haulage Co. of New York City, as a special assistant in charge of the Bureau of Motor Vehicle Transportation, which will be established. It is the purpose of the Postmaster General to increase the efficiency of deliveries by motor trucks and to reduce the cost of transportation.

#### Conference Planned

Matthiessen will confer with the automotive experts in the employ of the postal service and with manufacturers supplying trucks and cars to the government; he will reorganize the repair shops and expand their facilities through employing expert mechanics and garagemen. It is the intention of the Postmaster General to install a cost accounting system in order to determine the cost of operating the motor vehicle service. The latest labor-saving devices will be installed in the post office garages in the various cities.

#### In 271 Cities Now

There are now 271 cities in which Government-owned motor vehicles are operated, maintaining over 3600 motor vehicles. Its operating expenses annually amount to about \$15,000,000. There are nearly 5000 supervisory officials, clerks, chauffeurs, mechanics, etc., employed in this class of service. There are used for these trucks about 25,000 tires each year.

The motor vehicle service extends only to mail service within cities, such as collection and delivery of mail and transportation of mail from one point to another within cities. Rural carriers and contractors on star routes in rural territory operate their own motor vehicles.

#### Hays Explains

Hays said: "The Post Office Department began operating its own machines on a small scale with the establishment of the parcel post. Its great expansion has been made possible through the large number of motor trucks received from the War Department.

"The growth of this motor service occurred under abnormal conditions, such as produced by the war, and the tremendous growth of parcel post. Each large city built it up as a separate unit with a minimum of uniformity. Some few cities have splendid organizations and efficient service; many have been inferior and wasteful, due to lack of more uniform supervision."

## Mexican Business Growing Steadily

**Reports Reaching New York Say  
Conditions There Are Excep-  
tionally Good**

NEW YORK, Sept. 12—The automotive business in Mexico, with Ford as the leader who is opening up additional sales districts and pushing business in the older automotive centers of the southern republic, is extraordinarily good, to judge from all reports reaching New York. The Ford assembly plant at Houston, Tex., which handles all Ford business to that country, has just completed additional large shipments to both Mexico City and Tampico. The latter point is the center of the oil territory, and is booming again after the recent settlement of the oil export troubles.

These new shipments, made early this month, consisted of a trainload of Ford cars and trucks, consisting of 340 vehicles, to the Cia. Universal de Automoviles, S.A., in the Mexican capital, and a boat load of 100 cars and trucks to the Mayfield Auto Co., S.A. The shipment to Mexico City was handled as a special train and was subjected to no delay.

Owing to the freight rate charges, the Houston plant has effected new loading arrangements and completed touring cars were packed eighteen to a forty-foot car. This was three more than the previous loading. Fifty of the Model T chassis were likewise loaded into a single car, fifteen more than previously had been the case. The shipment to Tampico consisted of completed cars, equipped with Martin-Parry bodies, and were loaded under their own power.

Further comment upon the present situation in Mexico is contained in a letter from the Mexico City manager of one of the larger New York companies. Under date of Aug. 31, writing from the capital, he states "the automobile industry is not suffering in any way from lack of business just at present but rather from inability to secure enough cars."

Mexico was the chief buyer of American-made cars and trucks of all foreign countries during July, and reports from the exporters here indicate a continuation of the movement through August.

## Must Endorse Notes of Financing Firms

WASHINGTON, Sept. 12—Under a ruling issued by the Federal Reserve Board to-day, notes issued by a company engaged in financing the business of manufacturers are not eligible as commercial paper unless made or indorsed by a party to the commercial transaction out of which it arises. This decision covers any manufacturer who, desiring money for use in business for the purpose of paying for or carrying goods, enters into an agreement with the financ-

ing company that in exchange for a promissory note he will place the company in funds to meet the note at maturity and in the meantime pledges his merchandise to the company as security for his undertaking. The company then executes a note to its own treasurer, who indorses it in blank and delivers it to the manufacturer.

The question upon which the Federal Reserve Board was asked to rule is whether these notes are eligible for rediscount by Federal Reserve banks from the member banks which have discounted the notes for the company's customers. After giving the matter careful consideration the board ruled that these unindorsed notes could not be eligible.

"In the board's judgment, the spirit of the express requirement that paper to be eligible must arise out of a commercial transaction is not complied with in the cases where the sole party liable upon the paper is the person who has obligated himself for the accommodation of the party to the commercial transaction, even though the accommodating party is adequately secured and has a specific contract requiring the party to the commercial transaction to provide funds to meet the paper at maturity."

## N.A.C.C. Insurance Board and Underwriters Meet

NEW YORK, Sept. 12—The insurance committee of the National Automobile Chamber of Commerce and a committee representing the Automobile Underwriters Conference held a joint session here to-day to consider the evils which have grown up in automobile insurance. The N. A. C. C. committee presented to the underwriters additional facts in relation to its contention that the moral hazard has been ignored by the underwriters and that in countless cases cars have been insured for more than their value. There is evidence that the underwriters are beginning to recognize the validity of the N. A. C. C. contentions and that there is a gradual trend toward placing more emphasis on the character of the applicant for insurance.

## Mercer Refinancing Has Been Completed

NEW YORK, Sept. 12—Reorganization of the Mercer Motors Co. has been completed by the private sale of \$2,000,000 in 7 per cent, 4 year notes, and \$500,000 in 20 year first mortgage bonds. In addition, 100,000 shares of voting trust certificates have been disposed of, making 200,000 shares of these certificates outstanding. The corporation's balance sheet shows current assets of \$2,265,767 and current liabilities of only \$334,107. Since there are no sinking fund provisions attached to the notes and bonds the company will not be called upon to pay off any of this debt for at least four years.

## Shippers Protective League Is Organized

**Will Supply Armed Guards for  
Motor Trucks Running Be-  
tween Cities**

NEW YORK, Sept. 12—In order to insure against theft of goods carried by trucks in inter-city haulage, a prominent firm of underwriters in this city, Farjeon Ballin & Co., has taken steps to safeguard the load so carried.

This firm has organized an association called the Shippers Protective League, which supplies armed guards for trucks running between cities. The insurance company has also inserted a clause in its theft insurance policy stipulating that the trucks on which goods are insured shall travel in a convoy and shall be accompanied by the armed guards.

### Want States Aid

Finally, through various merchants' associations, this company is endeavoring to enlist the co-operation of the State constabularies in patrolling the roads where thefts have occurred and where thefts may be expected, such as the direct roads between New York and Philadelphia and between New York and Boston.

### Losses Bring Action

This move is a direct result of the tremendous losses suffered by insurance companies in recent months through the theft of goods so carried. In one week two different trucks were held up by armed bandits and their cargoes, valued at \$40,000 in each case, were stolen. Many insurance companies, when the risk involved in such policies became apparent, either charged prohibitive premiums or refused to include the theft and pilferage item in writing insurance on truck cargoes.

## Plan Factory Branch for Anderson in East

ROCK HILL, S. C., Sept. 12—The Anderson Motor Car Co. has decided to open a metropolitan factory department in New York with every facility to aid its Northern distributors and dealers. The headquarters in New York will be in charge of Charles B. Shanks, vice-president of the company, who took charge of the sales division on July 1.

The plans of the company comprehend maintaining in New York a stock of cars for the needs of the New England States, New York, New Jersey, Delaware, Pennsylvania and Ohio. A complete parts stock for all present and past models will be kept on hand and service men from the factory will be stationed in New York.

The New York factory branch is expected to bring about a healthy increase in sales and will employ a large number of workers.

## Cotton Boom Proves Tonic to Industry

### Atlanta Distributors Say It Will Bring Return of Normal Conditions

ATLANTA, GA., Sept. 14—The tremendous boom in cotton prices during the early part of September has proven one of the best tonics for the automotive industry throughout the South and will, it is the consensus among the Atlanta distributors, serve to rapidly bring the industry back to its normal status if the cotton prices now existent hold to that point for any length of time. In actual money volume the increase of more than \$40 per bale during the early part of the month means something like \$300,000,000 on this year's crop alone, to say nothing of the millions of bales of last year's crop that are still being held on southern farms and in the warehouses. With one of the shortest cotton crops in history there is little prospect of prices lessening for several months, while there is every indication that the staple will likely reach 25 cents per pound before the end of September.

This increase in cotton prices not only materially elevates rural buying power so far as the automotive industry is concerned, but it has its very favorable effect on every line of commerce and industry throughout the entire South, primarily the retail business. It therefore increases the buying power of commerce and industry at the same time and this, it is the opinion of the various distributors, will have the effect of materially stimulating the truck and commercial motor car business.

Automotive sales during August—and this was before cotton began its big advance—were better in this section that they have been in many months; and now with cotton having reached a substantial price September business in the automotive field will undoubtedly surpass the volume of any single month in more than a year. Already the advance is stimulating sales among the smaller dealers in the communities that depend mainly on rural trade, and marked improvement also is noted in the larger centers.

### Seek Co-operation of Bureau and Trade

NEW YORK, Sept. 12—Plans for effective co-operation between the motor vehicle industry and the newly created automotive division of the Bureau of Foreign and Domestic Commerce have been discussed by Gordan Lee, chief of the division and William I. Irvine, automotive trade commissioner with George F. Bauer, foreign trade secretary of the National Automobile Chamber of Commerce.

Means are being provided for the prompt preparation and distribution among manufacturers of specific data

bearing upon foreign automotive markets. With constantly changing conditions this service will fill a long felt want and enable manufacturers to conduct sales campaigns more effectively and opportunely.

### Plan Intensive Studies

It is planned that the activities of the new division will cover the more rapid distribution of monthly trade statistics, the preparation of reports based upon data received from the 600 agents of the Bureau of Foreign and Domestic Commerce, intensive studies of overseas markets and co-operation with manufacturers for the betterment not only of foreign trade but of domestic trade as well.

Just as soon as the division is organized fully, Irvine plans to get in direct touch with the export departments of the motor vehicle manufacturers to get their viewpoint of the nature of the information required of overseas automotive markets. This information will serve as a guide for the series of surveys which he will undertake in all automotive selling markets.

## Bull-Madison Assets Go to Bondholders

INDIANAPOLIS, IND., Sept. 12—Final disposition of the assets of the Bull Tractor-Madison Motors Corp., of Anderson, bankrupt, has been made by Harry C. Sheridan, referee in bankruptcy, in a ruling that Charles H. Jocknus of New York and John F. Green of St. Louis are entitled as bondholders to the proceeds from the sale of the property of the corporation. Hearing on the claims of the bondholders and of general creditors have been completed before the referee. The amount of the fund that has been held in the Union Trust Co. by Fred C. Dickson, trustee in bankruptcy, is \$120,000, practically all of which was claimed by Jocknus and Green.

The referee heard the claim of J. W. Sandsbury and the National Exchange Bank, of Anderson, that they were entitled to part of the fund through implied contracts, even though Jocknus and Green were conceded to be bona fide bondholders. Their claim was for about \$20,000. The Citizens Savings and Trust Co. and Wilbur M. Baldwin, trustees, of Cleveland, claimed \$6,400. The referee decided that the claims of the bondholders superseded the claims of those creditors whose claims he ruled, were general creditors' claims.

Bankruptcy proceedings were filed against the Bull Tractor-Madison Motors Corp., with property in Anderson and Minneapolis, Minn., in July, 1920. The trustee in bankruptcy sold the assets of the corporation in November to Goldstein Brothers of Philadelphia. The plants of the corporation have not been operated during the time of the litigation. Settlement of the title to the funds held by the trustee in bankruptcy, closes the case, except for formal orders, to be made by the referee.

## Steady Sales of Cars in Latin America

### Automotive Business in Pernam- buco Grows Despite Com- mercial Depression

PERNAMBUCO, BRAZIL, Aug. 9 (By mail)—Despite the fact that Pernambuco has suffered from the commercial depression, as have other Latin-American cities, there has been a steady sale of automobiles here, particularly of two makes that have been well introduced. It is believed that there are at least 100 more cars and trucks in the State of Pernambuco than there were last December.

The registrations here this month were 633 automobiles, 173 trucks and 15 motorcycles, a gain of 46 trucks and 7 motorcycles since December. An apparent decrease in the number of passenger cars is not correct, as their registry is frequently delayed and the complete number is rarely registered before the end of the year. In the States of Pernambuco, Alagoas, Parahyba do Norte and Rio Grande do Norte, the total is believed to be 1310, consisting of 160 trucks and 1150 cars.

### Depend upon Trucks

It is rumored that some of the big construction companies now engaged on irrigation dams in the drouth-stricken regions of Northeastern Brazil will depend to a certain extent upon trucks for transportation of construction materials from the railhead to the site of the dams. If this is true, it will imply the importation of a considerable number of trucks and probably some passenger cars. These vehicles probably will be used in the State of Ceara.

## New Models Lacking at Indiana Plants

INDIANAPOLIS, IND., Sept. 12—Present indications here lead to the belief that new models of Indianapolis made cars the coming year will be singularly lacking. Indianapolis manufacturers seem to be getting away from the new model idea to some extent, most of the effort being spent on improving present models. So far as can be learned not a new model is scheduled for this year except the new sedan of the H. C. S. Motor Car Co., announcement of which has already been made. Some of the plants are planning slight body changes although they are not ready to make known what the changes will be, yet it is certain they will be so slight as to make virtually no difference.

The September business, judging from factory sales, will be better than August with most of the plants. The Lafayette Motors Co. is putting out an average of five cars a day and officials of the company state that at the present time the plant is 100 cars behind orders, with the general outlook very promising.

## America in Strong Position in Europe

### Returned Automotive Representative Says Americans Do Not Have to Fear Competition

NEW YORK, Sept. 12—American automotive manufacturers have little to fear from European competition in the foreign markets of the world, provided the Americans go out energetically to hold and to develop further the markets that already have been opened for them. This was the statement made by C. H. Jerosch after returning from a trip to England, Holland, Belgium, France, Spain and Portugal, in the interest of the automotive lines on which he handles the foreign sales.

#### Have Inside Track

"The American manufacturers are in a strong position to go after business on a post-war basis," he said. "It is true that every kind of anti-American propaganda is being spread and this must be countered by our manufacturers. Also, the European manufacturers have an extensive propaganda under way in regard to their own products. But their cars and trucks are not comparable to those of this country; manufacture is conducted along different methods, and practically nothing in Europe can compete with our medium and lower-priced cars. The higher-priced cars have more direct competition but this can be overcome by those makers who will go into the foreign field with an honest and careful merchandising policy."

Jerosch believes that Spain is the most attractive country for the automotive exporter on the Continent. This excepts England, which, of course, has developed the automobile much farther. Spain is a rich country whose economic condition is such that exchange should right itself and whose automotive development has no more than begun. The automobile dealer in that country is generally of the younger type, ready and quick and appreciative of better merchandising methods. Road building is beginning, service stations and garages are becoming more numerous and a start has been made in the distribution of automotive fuel along the lines in use in this country. The Spanish tariff situation in regard to cars has been generally misunderstood, not only among exporters here but as well among the dealers there. It is not the stumbling block that is believed and, in fact, favors American imports over those from other countries.

#### Educational Work

Further educational work in regard to service is needed in Spain, as it is in all parts of Europe. Likewise, the Spanish automotive trade is being built up along the American lines, although in this the start only has been made. A large body of dealers already has been formed there and, while there has been much to com-

plain about regarding the treatment received from many American exporters and manufacturers, the proper kind of representatives can more than overcome these drawbacks.

#### Spain Will Compete

Spain will complete its post-war adjustment much quicker than most of the other European countries, as it has no great war debt and exchange will better whenever the demand returns for Spanish products. The result will be further large sales for those American manufacturers who will go after this business in an intelligent and conscientious way.

Jerosch also was enthusiastic about the sales possibilities in Europe of the light car, with small cylindrical capacity. Europe is turning to such vehicles because of horsepower taxation in several countries and because of fuel economy.

### Texas Dealers Show October 8th to 22nd

DALLAS, TEXAS, Sept. 12—Forty different makes of automobiles, a dozen different brands of trucks and a variety of automobile accessories, tires, etc., will be displayed at the annual automobile show of the Dallas Automobile Trades Association held in connection with the State fair of Texas here Oct. 8 to 22.

The forty different makes of automobiles means probably more than 150 cars will be on display while it is certain that a score of trucks and trailers will be exhibited. Every space in the big exhibition room at the fair grounds has been taken and many of the dealers here and out of town were not accommodated. In connection with the automobile show some of the leading men in the industry in America will be in attendance. Many of the exhibitors, through Dallas distributors, will bring special built cars for the show, it was said. These will be shown the retailers who are supplied through the Dallas distributors.

#### Expect 1,000,000 to Attend

In as much as the attendance at the fair will be more than a million the dealers of Dallas are expecting a wonderful improvement in the trade in this section as a result of the show. They expect to close many deals during the show at the show rooms and more of them at their down town places of business where expert salesmen and demonstrators will be at the beck and call of the men in charge of the displays.

Dealers are attempting to hurry up shipments of cars to be disposed of during the show. Some of the retailers of Dallas expect three hundred new cars to be disposed of as a direct result of the show and as many more to go before the first of December. The dealers will keep an index list of all prospects obtained at the show and keep everlastingly after them after the show until they own some kind of automobile. The show is expected to result in sales improvement throughout the territory.

## Radical Insurance Changes in Chicago

### New Rule Insures Cars Only Up to 90% of Total Value for One Year

CHICAGO, Sept. 12—Radical changes in its method of writing automobile insurance have been announced by the Firemen's Fund Insurance Co. Agents are being advised of a revision in the acceptance limits on automobiles and a change in the general conditions under which such insurance may be written.

Within recent months the fire feature in automobile insurance has come to the front with unusual force and theft risks are no longer considered the source of only loss. Losses from both causes are no longer confined to large cities but are spreading through the rural districts in such number as to cause alarm.

Under the new rules cars will be insured for not more than 90 per cent of their list price, irrespective of freight, war tax and the ordinary equipment. Second-hand cars will carry not more than 80 per cent of their purchase price; full particulars must be furnished on all mortgaged second-hand cars. Used cars in the hands of the original owners will be insured for a percentage of the list price after allowing for depreciation according to the rule printed in the rate sheet.

No cars are to be insured for a period longer than one year and authorization must be secured before dealers' lines and finance company's business is written. New policies are to be declined on cars more than three years old, except under special authorization, while there is a long list of exceptions of cars manufactured before 1920.

Agents are required to decline insurance on cars unless they are personally acquainted with the applicant and his financial standing, and if there is any question as to his ability to own and maintain a car the company is to be given the benefit of the doubt.

## Chevrolet Introduces Organization Journal

DETROIT, Sept. 12—Chevrolet Motor Co. has issued an organization paper, the Chevrolet Sales Speedster, which will be issued twice monthly "in the interests and for the inspiration of all who cooperate in the sale of Chevrolet transportation." The paper is practically dedicated to the proposition that the Chevrolet Model 490, as the second lowest priced car on the market, is entitled to be the second largest owned car on the market.

The paper is directed toward improving the merchandising efforts of Chevrolet dealers. In the first issue dated Sept. 1 leading articles are headed: "Talk Quality First Then Price," and "A Famous Model Improved."

## Manufacturers' Tax Favored by Hanch

Spokesman for N. A. C. C. Testifies in Washington—Wants Repeal of Excise Levies

WASHINGTON, Sept. 14—C. C. Hanch, executive vice-president United States Automotive Corporation and chairman tax committee National Automobile Chamber of Commerce, put the automobile industry on record as in favor of a manufacturers' tax and repeal of all war taxes in testifying before the Senate Finance Committee. It was his contention that the continuation of iniquitous taxes as contemplated in the House bill and proposals of the Treasury Department for internal revenue revision would result in "the perpetuation in this country of a sick prosperity."

As the discussion before the subcommittee of the majority members of the Senate Finance Committee was in behalf of all manufacturing interests, the spokesman for the automotive industry did not deal specifically with so-called "stigma taxes," as the excise taxes on automobiles are known. In substance, the committee representing various groups of manufacturers approved of the revised Smoot taxation plan which will be submitted to the Senate as a separate measure next week. The manufacturers' tax contemplated in the Smoot bill calls for a rate of 3 per cent, though there is a possibility that it may be reduced slightly.

Every speaker insisted that the abolition of war taxes was essential to the economic recovery of the nation. The committee was informed that manufacturers had taken a long step in voluntarily accepting a new burden in the form of a manufacturers' tax. It would mean increased expense in bookkeeping and auditing. It was only fair, they said, that the discriminatory taxes imposed during war conditions should be lifted and production allowed to regain normal status without tax restrictions. This factor is particularly important to the automotive trade at this time, when manufacturers are cutting prices. The war tax item appears as a big item in the final cost of a car.

The manufacturers' tax was defined as an assessment on all finished commodities sold or leased by manufacturers, producers or importers and it would be paid direct by the manufacturer, producer or importer. It was explained that it is not a sales tax as it does not bear on the retailers' sales and would be assessed at point of manufacture only, and consequently prevent pyramiding.

The manufacturers expect general public support for the program on the grounds that it is comparatively simple, bears on all manufacturers uniformly, is not so difficult of collection as many taxes which it would supplant and is a substitute for the existing "nuisance taxes." The program would involve the repeal of all levies not classed as indi-

### HAWAIIAN HORSE AND MULE GIVE WAY TO MOTOR CAR AND TRUCK

SEATTLE, WASH., Sept. 12—The day of the horse has ended in Hawaii, and, as in other parts of the world, his place has been taken by the motor car. Thousands of pleasure cars, trucks and tractors are now in service in the islands and the automobile is in a decidedly flourishing condition.

On the large sugar and pineapple plantations the mule and the horse have about disappeared and this work is now being done almost exclusively by tractors and motor-driven plows.

When the delegates to the press congress of the world come to the territory in October for a two weeks' session they will find that splendid automobile roads lead to every point of interest in the islands, even up to within a few yards of the active volcano of Kilauea on the island of Hawaii. The territory is spending millions yearly on its roads and one of the largest road building programs in its history is being carried out, for which the advent of the automobile is largely responsible.

vidual or corporation income taxes, inheritance taxes and special taxes on tobacco, narcotics and oleomargarine. Senator Smoot's program provides for revenue from a new customs tariff measure, but this was not mentioned by the manufacturers. Excess profits taxes were discussed in a broad manner and nothing was said of their effect on automotive trade.

Hanch also spoke for the National Automobile Dealers Assn., Motor and Accessory Assn. and Rubber Assn. of America.

### NEW ROADS IN CAROLINA

RALEIGH, N. C., Sept. 15—The North Carolina State Highway Commission has completed, or has under contract and construction, 1,012.64 miles of road, at a cost of \$14,600,753.12, according to recent figures issued by the commission. Three hundred and fifteen miles of this work already has been completed and the remainder will be completed during the next fiscal year of the commission. The cost of the work already completed is \$4,040,184.

### HUPP MOTORS REPORT

NEW YORK, Sept. 15—The general balance sheet of the Hupp Motors Co. as of June 30, 1921, shows cash on hand of \$647,709 as compared with \$1,026,048 on the same date last year. Inventories valued at cost were \$3,156,141 as against \$3,791,368. Accounts payable aggregated \$1,828,453 against \$1,838,110 last year while the profit and loss surplus was \$4,831,768 as compared with \$4,002,344 the previous year.

## Reductions Bring 50% Ford Increase

First Week Shows Heavy Orders  
—100,000 Capacity Assured  
for Fall

DETROIT, Sept. 15—The Ford Motor Co. to-day reports an increase of 50 per cent in orders during the first week following their newest price reductions Sept. 2.

Orders had fallen off in August, due to late summer influences, and some slight stocking has been experienced in the company's 35 branches throughout the country. All of this stock was cleared out in this first week and deliveries are already running behind, especially on enclosed types.

The factory reports orders piling up to an extent that will practically insure capacity production on the present 100,000 monthly basis during September and October.

## Texas Service Men Plan Organization

DALLAS, TEX., Sept. 13—For the purpose of a closer co-operation and deriving more benefits and with a view of systematizing the business in Dallas for the purpose of giving the customers the greatest possible benefits for the least money, the automobile service station men of Dallas are forming an organization. The organization will eventually include every service man in the city and when this is completed the automotive business in Dallas will be about the best organized industry in the State. Every line of the business will have organizations of its own and representatives from these organizations will make up the automobile club proper, or rather the automobile dealers association.

Officers of the service men's organization are: N. H. Billing, Overland Co., chairman, and J. R. Stoorza, Franklin Co., secretary.

The service men have already held two meetings and at the next meeting they expect to complete the organization and elect officers for the year. It will then begin holding regular meetings for the purpose of discussing matters of interest to the service men and planning ways to render the customers more efficient service.

### SERB TRADE FAIR

LONDON, Aug. 31 (*By Mail*)—A report has just been issued by the British Department of Overseas Trade on the economic resources and industrial conditions of the Serb-Croat-Slovene Kingdom. It drives home the fact that in this as well as in other Balkan countries salvation must come through transport. Considerable improvement has been shown since the war, but much still remains to be done.

## METAL MARKETS

**D**EMAND from the automotive industries, which not so very long ago formed the steel industry's sole sustenance, is coming in temporarily for somewhat less attention because of the more diversified inquiry. The market is broadening, but not so much in point of the tonnages involved in individual transactions as in the greater variety of the industries showing an interest in offerings. On the basis of the post-armistice experiences of the steel market, economists will some day lay it down as a law that the first phase of a cycle embracing steel market activity consists of buying by the automotive industries and, as the momentum of this buying increases, it tends to bring out till then latent demand from other industries. An unbiased survey of the steel market in the last few months reveals clearly that the automotive industries have once again furnished the tow by which steel producers were enabled to extricate themselves from the rut of utter inertia. Operations have not yet assumed normally large proportions but, in contrast with the depression of a few months ago, they are impressive. Moreover, they are accompanied by a symptom that has been in evidence on previous occasions, when automotive buying had lifted the steel industry out of the mire, a hardening of the market for the kinds of steel products which automotive manufacturers are especially interested in. There have been no advance so far. In fact, none is imminent. The undertone, however, is decidedly steadier, if not stronger. Price increases noted within the last few days on wire and wire products were rather in the nature of corrections than advances. In the general price upheaval several items were cut out of proportion to others and readjustment of these was a foregone conclusion. Lest steel buyers fall into the error, common in Wall Street, of interpreting every diminishment of the Corporation's unfilled tonnage as an indication of untoward conditions in the steel industry, it may be emphasized that the decline in the Corporation's unfilled tonnage on August 31 was chiefly due to heavier shipments in August made possible by improved production conditions and, moreover, resulting in a large measure from eagerness to obtain cash for as much steel in course of production as possible. Production all along the line is slowly but steadily increasing.

**Pig Iron.**—Bullish gossip continues to be the market's diet, one selling interest outdoing the other in picturing rosy conditions. Further advances have been proclaimed by Middle West producers. Certain it is that all bargains have disappeared from the market and that there is more or less uniformity in the prices quoted by different interests to the few automotive foundries that are just now in the market for pig.

**Steel.**—Sellers are showing considerably greater reluctance when it comes to accepting bids that entail concessions from current quotations. The sheet market, especially, has gained in firmness and activity. In the Youngstown district independent producers who up to a fortnight ago were supposed to be shading the Corporation's price to the extent of \$2 a ton are seemingly striving to obtain the full Corporation price on new business. Cold-rolled strip steel is moving in modest tonnages at around 3.85c., base, Pittsburgh. All in all, automotive demand is of a routine character.

**Aluminum.**—The feeling persists among

importers and resellers that just as there has been a minor movement in copper and lead in the last few weeks, so aluminum will come in for more activity in the near future. Quotations so far, however, remain unaltered.

**Copper.**—Although there has been no marked increase in domestic or foreign demand and no perceptible diminution of the large accumulations, the copper market has been elevated, ostensibly for the beneficial effect of such an advance on the copper securities situation.

**Lead.**—Recent price advances by the chief producing interest were ascribed to the large amount of business with which this seller has lately been favored. The "outside" market responded, however, to a certain extent. By way of justification for these advances, it may be said that lead, unlike copper, zinc and aluminum, does not suffer from a large unsold surplus accumulation.

## INDUSTRIAL NOTES

United States Motor Truck Co., of Cincinnati, has had made by the Rothacker Film Co. of Chicago, a two reel motion picture of its executives and factory which will be displayed throughout the country in cooperation with agency owners. Zone men will be equipped with a suitcase and projection machine which will permit screening the films in a hotel parlor, hall, salesroom or in an office. If an agency owner has a prospect who cannot be induced to come to a private movie show, he can take the picture to the prospect's office and screen it on the wall. Tracts in foreign languages will be sent abroad.

Coats-Steamer Automobile Co., Indianapolis, incorporated in Delaware for \$5,000,000, is seeking a location at Terre Haute, Ind., on which to erect a large manufacturing plant. The company, according to George Rowland, of the Rowland-Power Collieries Co., who made the proposition to the Chamber of Commerce directors, is after a location 600 x 75 feet, with acreage for expansion.

May Body Co., Toledo, O., builders of truck bodies, whose plant here was burned out a few weeks ago, has taken a lease on the plant formerly occupied by the Toledo Bending Co. The company will install new machinery for the manufacture of sail and power boats also.

Coast Tire Co.'s plant is now in operation in Oakland, Cal., turning out 200 tires daily, having been opened with a banquet on September 1. The payroll is now \$25,000 a month, is disbursed in the concrete "all-daylight" factory just completed here. Rubber is brought here direct from Java by water, eliminating the shipment of the crude product east and the finished tires back west again.

## MOON SALES INCREASE

ST. LOUIS, Sept. 12.—The Moon Motor Car Co., which last week made a sharp reduction in prices of its cars, based on 1914 labor, material and production costs, announces that domestic sales for the first six months of this year were 14 per cent larger than for the same period last year. With the lower prices it is expected that the last half of 1921 will equal or exceed the first half.

## N.A.C.C. Will Inquire into "Pirate Parts"

## Probe to Follow Complaints That Devices Have Hurt Reputation of Cars

NEW YORK, Sept. 12.—Directors of the National Automobile Chamber of Commerce have authorized a careful and complete investigation of the question of "pirate parts." It is asserted that an increasingly large number of parts of this character are being placed on the market. Many complaints have been made that when they have been used in the manufacture of motor vehicles they have not given good service and have injured the reputation of the cars in which they were used. Some of the vehicle manufacturers say they have taken up the use of "pirate parts" because they could be purchased for prices considerably lower than those charged for the standard parts which previously have been used.

Believing that a very large number of accidents are caused by over-speeding of motor cars and motor trucks, coupled with the over-loading of the latter, the N. A. C. C. is calling upon police officials of the country for a more strict enforcement of the traffic laws, of which there are a sufficient number on the books, but the provisions of which have been too generally disregarded.

Reports show that over-loading of trucks of all sizes have in some cases harmed the roads and in other cases have overcome even the powerful brake equipment, resulting in accidents that could have been avoided.

The N. A. C. C. believes that a two-ton truck carrying four tons is more dangerous on the highways than a five-ton truck with its normal load of five tons. It indorses the Pennsylvania law which requires each truck to bear a lettering showing its weight, the body weight and the weight of the load which it should carry. The chamber opposes truck bodies of abnormal size and advocates loads which will conform with the recommendations of automobile and highway engineers for one-inch width of tire for each 800 pounds of weight.

Secretary Fenn of the motor truck committee reported to his committee last week that Brigadier General Dawes, Federal Budget Director, had asked for a conference on the best means of liquidating the unserviceable army trucks which are stored at Camp Holabird, Md. Sale of these trucks will interfere very little with the market for new vehicles.

At the quarterly meeting of the truck committee in October, there will be a detailed discussion of truck paper and means of making it more promptly acceptable, either through banks or through truck companies. This question will be discussed by a prominent banker.

The committee also will take up the study of new markets for trucks. Attention will be given first to the street railway industry as a market.

## MEN OF THE INDUSTRY

Richard C. Fowler has resigned as assistant sales manager of Delco Light Co. to become vice president of Campbell, Trump & Co., advertising agency of Detroit. Gage C. Tremaine has been named secretary of the company. With the addition of the new officers the agency name has been changed from Campbell, Blood & Trump to Campbell, Trump & Co.

L. L. Murphy has resigned his connection with the Olds sales branch in Detroit to join the Studebaker Detroit branch. Murphy at one time was cashier at the Olds factory.

R. N. Mosher, head of the Michigan Oldsmobile Co. has resigned after 17 years connection with the Olds Motor Works during which time he served as comptroller and later in sales capacities. His plans for the future are not announced.

Olin R. Smith, who for the past three years has been advertising manager of The Moto-Meter Company, Inc., Long Island City, N. Y., has joined the staff of the Palmer Advertising Service, 137 E. 43rd Street, N. Y. C. Smith will specialize on dealer helps such as window and counter displays, direct by mail folders, and dealer material.

Frank G. Eastman has been appointed one of the executives associated with Norval A. Hawkins, director of sales, advertising and service for the General Motors Corp. at Detroit. Eastman was a Detroit newspaper man for several years. He went with the Packard Motor Car Co. in 1911 and soon after was promoted to advertising manager. For the last two years he has been doing special work for the Lincoln Motor Car Co.

C. G. Williams has been appointed manager of the Cleveland branch of the McGraw Tire & Rubber Co. to succeed D. C. Hathaway who has been appointed assistant sales manager of the company. Williams has been assistant branch manager.

William M. Sweet who has been assistant to Alfred P. Sloan, Jr., vice president of the General Motors Corp. in charge of production, will leave the New York headquarters Oct. 1 to take an important executive position with the Klaxon Co. which is a General Motors unit. Sweet formerly was secretary of the Motor and Accessory Mfrs. Ass'n.

C. C. Hanch, vice president of the National Automobile Chamber of Commerce and chairman of its tax committee will soon become executive vice president of the United States Automotive Corp., makers of the Lexington automobile with headquarters in Connerville, Ind. Hanch will have active charge of the operating policies of the corporation, which also includes the Ansted Engineering Co., the Ansted Spring & Axle Co., the Connerville Foundry Corp., The Fayette Painting & Trimming Co. and the Teeton-Hartley Motor Corp.

## FINANCIAL NOTES

Jordan Motor Car Co. directors have voted to declare their regular 1½% quarterly preferred stock dividend payable Sept. 30 to stockholders of record Sept. 20. The company has enjoyed good business for the last quarter showing a good increase in production over the same period 1920.

Columbia Motors Co. of Detroit has filed a balance sheet as of Dec. 31, 1920 which shows cash on hand \$118,186, accounts receivable \$825,418, stores and material \$1,275,933, contracts for parts and materials \$3,290,000,

accounts payable \$26,520, notes payable to banks \$375,000, stock outstanding \$5,169,440, surplus \$42,900 and total assets and liabilities \$6,283,816.

The Chandler Motor Car Co. has declared a regular quarterly dividend of \$1.15 a share payable Oct. 1 to stockholders of record Sept. 20.

International Harvester Co. of Chicago has declared the regular quarterly common dividend of \$1.25 a share payable Oct. 15 to stockholders of record Sept. 24. In June the regular quarterly common dividend of \$1.25 and an extra stock dividend of 2% was declared.

Texas Motor Car Assn. has adopted a reorganization plan calling for an assessment of 21 cents per \$1 stock.

Kelly Springfield Tire Co. sales are 25% ahead of final figures for August, 1920, despite present lower prices. Final August figures should materially increase this lead. Final July sales were close to \$3,000,000. Company has quadrupled its sales without increase in accounts receivable. Existing stocks of tubes held by 126 tire companies placed at three weeks supply and of tires at five weeks supply, based on July sales. This indicates a healthy condition in the industry.

New York Man Appointed  
Kelly-Springfield Head

SPRINGFIELD, OHIO, Sept. 13—Following the arrival here to-day of Charles Willard Young and Edward O. McDonnell of New York, James L. Geddes, chairman of the board of the Kelly-Springfield Motor Truck Co., announces that Young has been chosen as president of the company. McDonnell was appointed as general manager. Both have been connected with the Emerson-McMillen Co. of New York. Geddes said the company has more orders to-day than any day during the last year and that prospects are extremely bright for the future.

## MOTOR TAX TAKEN OUT

WASHINGTON, Sept. 12—New recommendations made to the Senate Finance Committee by Secretary of the Treasury Mellon in reference to taxation do not contain his original proposal for a Federal tax on automobiles. So much opposition to this plan developed that it has been definitely abandoned. He urges repeal of the excess profits tax effective as of January last and of the tax on capital stock for 1922, which was payable July 1 last. Reduction of the high income surtaxes to 25 per cent also is urged. The loss in revenue by repeals and reductions would be partly offset by an increase from 10 to 15 per cent in the tax on the net income of corporations.

## S. A. E. AFTER THIEVES

NEW YORK, Sept. 12—The committee of the Society of Automotive Engineers which has been investigating methods of marking both engine blocks and frames in such a manner that they will be difficult of alteration by thieves will meet in Cleveland Sept. 20. The purpose of the committee is to devise some plan which will be practical from an engineering standpoint. The insurance underwriters have offered a discount of 20 per cent for approved markings.

## BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.

NEW YORK, Sept. 15—The Federal Reserve System's statement for Sept. 7 revealed a decline in the reserve ratios as a result of increased note circulation, deposits and total bills on hand—an indication of increased member-bank borrowings. The fall crop moving demands and the need for additional currency over the holiday period were undoubtedly responsible in part for the \$36,097,000 increase in Federal Reserve notes in circulation. While gold reserves increased \$15,317,000, and cash reserves about the same amount, total bills on hand increased \$26,152,000, largely through the increase in the amount of bills purchased in the open market. Total deposits increased \$27,314,000. As a result of these changes, the ratio of total reserves to deposit and Federal Reserve note liabilities combined declined from 66.8 per cent to 66.2 per cent. The seasonal effect on the banks was more apparent, however, in the statement of the New York Federal Reserve Bank, where the ratio declined from 75.5 per cent to 72.9 per cent. The flow of funds to the interior was reflected in the decline of \$31,188,000 in the New York bank's share of the gold settlement fund. As a consequence the gold reserve of the New York bank declined \$18,427,000 in spite of increased holdings of gold and gold certificates, etc.

Call money on the local market last week ranged from 5 to 5½ per cent, as against 4½ per cent to 5½ per cent the week before. The renewal rate was 5½ per cent all week until Friday when there was a decline of ½ per cent. Call money was in rather liberal supply and funds were obtainable on the "outside" market at rates somewhat under the quoted rates. There was an easier tone in the time money market towards the close of the week when 60- and 90-day paper was obtainable at 5½ per cent to 5¾ per cent, while the longer maturities up to 6 months were quoted at 5¾ per cent to 6 per cent. In the previous week all maturities were quoted at the latter figures. There was little activity in the commercial money market, the rates remaining unchanged for 6 months' prime paper. Although there were a number of large-sized bond offerings during the week, they were, in general, well received and had little effect on the money market.

In the past week the striking features of the financial markets were the decline in the German mark and the activity in the cotton market, following the announcement of the short crop. After having declined below 1 cent last week, the mark on Monday of this week reached a new low for all time of \$0.0091. Spot cotton reached a high of 20¼ cents per lb., marking a rise of 9¼ cents from the low point of June.

The foreign trade figures for August showed the largest exports since March, largest imports since May and the largest excess of exports since February.

# Calendar

## SHOWS

- Sept. 5-10—Indianapolis, Automobile and Accessory Show in conjunction with Indiana State Fair conducted by Indianapolis Automobile Trade Association, John B. Orman, Mgr.
- Sept. 9 to 17—Ottawa, Ont., Can.—Ottawa Motor Show.
- Sept. 28 - Oct. 8—New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.
- Nov. 14-19—Jersey City, Second Annual Automobile Show of Hudson County Automobile Trade Association, Fourth Regiment Armory.
- Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.
- January—Chicago, Automobile Salon, Hotel Drake.
- Jan. 7-13—New York, National Automobile Show, Madison Central Palace Auspices of N.A.A.C.C.
- Jan. 28-Feb. 2—Chicago, National Automobile Show, Coliseum, Auspices of N.A.A.C.C.

- Jan. 30-Feb. 4—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.
- Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.
- Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.

## FOREIGN SHOWS

- September—Buenos Aires, Argentina, Passenger Cars and Equipment, La Pabellon de las Rosas, Automovil Club Argentino.
- September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery, Palermo Park; Sociedad Rural Argentina.
- September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.
- Sept. 23-Oct. 2—Berlin, German National Automobile Show, Auspices of German Automobile Mfg. Ass'n and German Automobile Club.

- Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.
- Oct. 10-22—Olympia, England, Truck Show, Nov. 4-12—Car Show, Nov. 28-Dec. 3—Motorcycle Show.
- Nov. 4-12—London, British Motor Show, Society Motor Mfrs. and Traders.
- November 7-14—Paris, Seventh International Exposition of Aerial Locomotion in the Grand Palais of the Champs Elysees, Held by the Chambre Syndicale des Industries Aeronautiques.
- March, 1922—Santiago, Chili, Annual Automobile Show.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador, Automotive Section.
- Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

- Sept. 14-15-16—Cleveland, Second International Cost Conference, Auspices National Association of Cost Accountants.
- Sept. 14-15-16—Detroit, Credit Convention Motor and Accessory Manufacturers Association.
- Oct. 12-14—Chicago, Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.
- Nov. 15-16—New York, Convention of Factory Service Managers, National Automobile Chamber of Commerce.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

## S. A. E. MEETINGS

- New York, Sept. 15—Fuel Session.
- Worcester, Sept. 17—New England Section.
- Philadelphia, Sept. 22—Pennsylvania Section.
- Detroit, Sept. 23, Oct. 21, Nov. 18, Dec. 23, Feb. 24, March 24, April 23, May 26.
- Dayton, Oct. 1—First Fall Meeting.

## September Business Improves in Texas

First Ten Days Show Daily Average Record for Entire Year  
—Trucks Better

DALLAS, TEX., Sept. 12—The automobile business in Texas started off with a rush in September. Reports from dealers and distributors in Dallas for the first ten days of the month showed more cars sold per day than any similar period during the present year. As was the case during August when the retailers of Texas just about established a record business, the majority of the sales were medium priced cars. Retailers attribute the increasing number of sales to continued reduction in prices. The prospective customers appear to think the bottom prices have been reached and they are taking advantage of recent reductions, probably fearing there will be an advance before other reductions come.

Dealers in high priced cars report business stimulated by recent reductions in modern priced automobiles.

What was true with the Dallas retailers was true of the retailers of Fort Worth, Wichita Falls, Waco, Abilene, Amarillo, Sweetwater, San Angelo, Temple, Houston, Galveston, Beaumont, Denison, Sherman, Greenville, Gainesville and a half dozen other Texas cities.

Accessory men said business was better than any ten days for the past twelve months. The garage men said they had all they could do. The tire men were kept busy day and parts of the night.

Truck dealers reported considerable sales with more prospects than they have had for months. They declare the good grain and cotton crops with good prices are stimulating sales.

## New Car Developed, To Be Made at Toledo

TOLEDO, O., Sept. 12—A new light car with general dimensions and power plant smaller than those of any car now on the American market has been developed by the Automotive Corp. It is designed as a two-passenger car only and has a wheelbase of 91 in. The engine is a four-cylinder one of 2½ in. bore by 3½ in. stroke; it is air-cooled and is said to develop a maximum of 22 hp. and to turn up to 3500 r.p.m. The valves are located in the cylinder heads and lubrication is by force feed and splash.

The clutch is of the dry disk type and the transmission a three speed and reverse sliding gear type with standard control positions. Transmission to the rear axle is by propeller shaft with a single disk type universal joint at the forward end. Quarter-elliptic cantilever springs are fitted all around. The car is said to weigh 900 lb. and it is to sell at \$375, not including top, windshield and spare wheel. The special advantage claimed for the car is high fuel mileage.

## FISK-FEDERAL MERGER

NEW YORK, Sept. 12—Consolidation of the Fisk Rubber Co. and the Federal Rubber Co. will have no physical effect but it makes possible refinancing of the two corporations as a single unit and is regarded in financial circles as a constructive measure. Production at the Fisk plant is running about 10,000 per day and at the Federal plant at Cudahy, Wis., at about 2000 per day. Neither company has large stocks of tires on hand and the output is kept close to sales. On the basis of current operations, Fisk soon will be on the market for crude rubber and cotton fabric. It had some high priced materials but they were written down to market levels.

## Rumor Durant Will Purchase Peerless

Meeting Expected to Bring Announcement Does Not Materialize—Officers Silent

CLEVELAND, Sept. 14—Reports have been current in Cleveland that an announcement would be forthcoming soon concerning the sale of the Peerless Motor Car Co. to W. C. Durant of Durant Motors, Inc., and it was expected that the announcement might follow a meeting which was to have been held Tuesday. The meeting, however, did not materialize.

B. G. Tremaine, president of the Peerless company, attended a meeting in New York, Tuesday, but other officers of the company have declined to state what subject was taken up.

The report of the sale which has been in circulation is responsible largely for the increase in Peerless stock, which has gone up from \$25 a share to \$40. The Peerless company is a \$10,000,000 corporation, and the Peerless plant in Cleveland covers 20 acres. The company is the only one here which manufactures an eight-cylinder car. It is said that if Durant takes over the company production will be doubled.

## TORONTO TRIES BUSES

TORONTO, ONT., Sept. 12—The City Transit Commission, which has recently taken over the trolley lines, has begun experimentation with trackless gasoline propelled motor buses for use in some sections of the city. A bus of the Fifth Avenue type and a Tilling-Stevens vehicle of the type used on London streets have been procured and will be tested out by the Toronto Commission.

You know—every intelligent executive knows—the vital importance of maintaining, at all times, a well-balanced stock of automobile body hardware.

Inventory sheets have shown too many concerns a vast accumulation of obsolete material, representing, perhaps, an outlay of thousands of dollars—*absolutely wasted*.

Never need this condition exist in your plant. Nor is there any occasion for your being over-stocked on some items and short on others. Neither should you find it necessary to be continually redesigning and substituting.

Ternstedt will supply you with *standardized* hardware for every requirement—and will place it in your plant only as you require it—dispensing entirely with the need of tying up good money in equipment that may never be used.

Purchasing their body hardware *complete* from Ternstedt has put a permanent stop to discouraging inventories for scores of representative motor car manufacturers and body builders.

Let us give you further common-sense reasons why you, too, should concentrate in Ternstedt.

## Service Dominant Idea at M. A. M. A. Credit Meeting

Service to the motor vehicle user is an obligation of both parts and car manufacturers, speakers say. Spirit of cooperation appears in credit discussions. Better selling methods considered a necessity.

By James C. Dalton

**W**HILE there was unanimous agreement that business has turned the corner and that prosperity is on the way, that was not the big, vital dominating thought to be gained by the automotive industry from the fifth annual credit convention of the Motor and Accessory Manufacturers' Association, held at Detroit Sept. 14, 15 and 16.

The fundamental, brass-tacks message of every speaker was that the time has come when the interests of the ultimate consumer must be taken into account before everything else. Each one hammered home with iteration and reiteration the plea, which amounted to a demand for real service to the buyers of motor vehicles.

Every convention has a keynote and this meeting had one which sounded so loud it might have been mistaken for a brass band. That message was SERVICE in the blackest and biggest of capital letters. When the parts makers talked about service they meant not merely the merchandising of motor vehicles but their maintenance after they are sold. In fact maintenance seemed to be considered fully as important as the initial sale, for the replacement market looms large in their calculations.

The plea for service for the purchaser ran all the way from the raw material producer to the man who operates the cross roads service station and sells gaso-

line or adjusts carbureters. There was recognition of the need for making dealers in automotive merchandise real merchants who know how to sell as well as the butcher, the baker, the grocer, et al.

The parts and accessory manufacturers confessed their own obligation in this respect, but insisted that every branch of the industry has at least an equal obligation. They considered the problem from every angle.

Unanimity on the need of service was the more remarkable because that subject had no definite place on the program. When every speaker took it by the nape of the neck and dragged its shrinking form into the light to be put upon the rack there was no escaping the thought that was uppermost in every mind.

Service was by no means the only subject considered and there was much in what was said for the manufacturers of motor vehicles to ponder over. The convention, the most successful the association ever held, naturally was designed for consideration of the problems peculiar to the parts maker, but it was apparent that the 250 members present, representing the leading companies in the parts field, had agreed that the industry as a whole has common obligations and common interests.

Increased sales of motor vehicles are just as much to the interest of the maker of axles and piston rings

as it is to the manufacturer of cars and trucks or the man who sells them. A spirit of co-operation shone through the entire convention, both on the floor and in the hotel lobbies. There was evident an earnest desire to be mutually helpful.

One incident will suffice as an illustration. There was scheduled an open discussion of business conditions within the industry from the credit standpoint. L. L. Smith, assistant treasurer of the B. F. Goodrich Rubber Co., was the leader. He contended that the members of the M. A. M. A. had been unduly merciful and that it was high time drastic action was taken, even through legal proceedings, against companies which have had accounts past due for 12 or 15 months without reducing them a dollar.

The slogan last year, he said, was "no bankruptcies," but these manufacturers have had their chance and haven't worked out of the hole. Many of the ones in this class were virtually insolvent before the war but were saved by the insatiable demand for their products while hostilities were in progress. Now they have reverted to their pre-war status. They are resorting to every means, stock-selling and otherwise, to hang on. He held that it was time to protect the public from these stock jobbing schemes. Manufacturers in good standing have the field pretty well covered and there is no hope for the others, Smith said.

"We're through taking gold notes and gold bonds and promissory notes," he declared.

It might have been expected this ultimatum would have been received with three rousing cheers, but it wasn't. On the contrary there was a storm of opposition. It was asserted that a live company, even though it may be moribund, is much better than a dead one. It was contended precipitate action of this character against the companies which may deserve little sympathy, might lower the morale of the entire industry and force to the wall others which are striving manfully to get out of their present troubles with every prospect of success. Those which are without bank support might involve others which have.

Instances were cited of companies which had been tangled up in bowknots of financial difficulties but had been straightened out through the co-operation and consideration of creditors. The majority plainly were determined to go on "holding the bag" until the time is more opportune for "rocking the boat."

While the plea for charity prevailed it brought with it some plain speaking. Inefficient management was held responsible for the troubles of most of the vehicle companies now in difficulties. This inefficiency ran all the way from general managers who had been good salesmen but didn't know a balance sheet from a roll of wall paper, down to retail sales organizations which failed to function because of the stupidity of some of the men in them. It was held that if executive and managerial ability was hoisted a few notches it would be generally helpful.

The moral hazard in the business was not overlooked and it is likely to play an increasingly important part in the granting of credit. More than one speaker asserted that the industry should purge itself of "fly-by-night" enterprises which prey upon the public by putting on the market a few vehicles which soon become orphans, or which sell worthless securities. It was dryly remarked, however, that the public sometimes resents being protected and that it seems determined to have its pretty gilt bricks.

Fully as striking as the desire to co-operate in saving concerns with potentialities for success, and many of

them have been saved by forbearance, was the proposal made by more than one that parts makers might profitably spend their own money to expand the sale of motor vehicles.

William H. Huff, advertising manager of the Disteel Wheel Corp., Detroit, proposed that a co-operative advertising campaign along this line be conducted through the M. A. M. A. Men should be taught how to sell, he said, and there is a pathetically large number in the automotive industry ignorant of the products they are merchandising. He told of live prospects within his own acquaintance who never had been invited to buy a car or even accessories for the ones they now own. It was his opinion that the M. A. M. A. could well afford to hire a big man to plan selling campaigns. Better motor cars and trucks are a necessity, he said, as well as better distributors and dealers.

Arthur T. Garrett, editor of the house organ of the Timken-Detroit Axle Co., who represented Frank N. Sim, advertising and assistant sales manager, told of the advertising his company is doing to boost sales of motor vehicles without any reference to its own products.

Huff and Garrett spoke in a symposium on "Selling Strategy to Bring the Automotive Industry Back to Normal." The ideas brought out in these talks applied to all branches of the industry and included some of the strongest sermons on service. Notable in this respect was the address of F. S. Armstrong, sales manager of the Vesta Battery Co., Chicago.

Armstrong began by declaring that times could not be "considered normal when hectic buyers were clamoring to buy ash cans on wheels, backed by Gyp the Blood for \$1385 f.o.b. Detroit."

"Automobile manufacturers must realize," he said, "that the buying public is using uncanny discrimination in getting real values. Car selling is not the only strategy. The chief thing to be improved and the one that will help most of all is improved service. It must be service that means something, not merely mechanical service, but the morality of service. This kind of service will improve business. Many a car owner skins his knuckles tinkering at some job for which he would gladly pay a service man what it was worth, but not five or ten times what it is worth. The Gyp the Blood must go. I proudly profess a religion of service. He profits most who serves best. The automotive industry must get together to raise the standards of service. We have only one customer and that is the ultimate consumer."

Most eloquent of Armstrong's words was his statement that August was the biggest month the Vesta Battery Co. ever had.

Joseph Jacobs, advertising manager of the American Hammered Piston Ring Co., Baltimore, advised every company to analyze its own problems and get down to business, chiefly by strengthening its sales organization and teaching its men how to sell and how to give service. He said that because of this system his own company had done as much business in the eight months ending Aug. 31 as it did all of last year and that it expected the year to show an increase of 100 per cent.

Another gospel in addition to that of service was preached. It was the essentiality of the motor vehicle as an agent of transportation. B. F. Rutherford, vice-president of the B. F. Goodrich Rubber Co., and of the M. A. M. A., declared every man in the industry should make this a creed like the Lord's prayer or the national anthem. In estimating what was normal, Rutherford said a good definition was:

"Normal in 1913 plus the progress which has been made since then."

In connection with sales strategy he declared there

never was a time like the present to stick to fundamentals, but that this did not mean to cling like grim death to obsolete methods. Reduce stocks and inventories, he said. Put individuals to the test. It is all a question of economics. Here are some of the things he suggested:

**Establish a price level, study your markets, cut selling costs, cut your past due lists, have salesmen make collections, strengthen the allegiance of your customers, recognize that you are in competition, study the best ways of doing business.**

In a discussion of the credit situation, C. S. Davis, secretary and treasurer of the Warner Gear Co., Muncie, Ind., gave some advice which might be applied by every man with goods to sell. As a preliminary, he said the interests of the car builders were the interests of the parts makers. He advised that information upon which credit was granted should include the following points:

Financial condition and current statement.

Reserve financial resources.

Sales position viewed broadly, including character and capacity of sales organization.

Personality of active officers.

Managerial and organization policies.

Resentment of any imputation that the motor car is not an essential ran through the whole thread of the convention. It was emphasized by Harry G. Moock, general manager of the National Automobile Dealers Association, in his address on "Business Conditions in the Automotive Industry and the Prospects for the Future," from the standpoint of the dealer. It might be stated parenthetically that Moock made one of the hits of the convention. It was evident the parts makers were eager to hear of the dealers' problems and sympathized with them.

Moock sketched the financial troubles which began for the dealers when the governors of certain Federal Reserve Banks gave out the dictum that motor cars were luxuries and that automobile paper would not be rediscounted. He recounted the fight of the N. A. D. A. to have the stigma removed but declared that while the battle had been successful so far as official action went the prejudice still prevailed in many banks, especially in the rural districts.

"Many dealers are honest, statements to the contrary notwithstanding," said Moock. "The dealer is the buffer between the manufacturer and the ultimate consumer. I admire him for the way he has met his problems. He has kept the factories running in spite of every obstacle. The dealers who are real merchants are doing business and selling cars.

"The average business life of the automobile retailer is 3½ years. The average of all retailers is 7½ years. Something must be done besides making cars and shipping them out with bill of lading attached. The dealer

must be shown how to do business. The flux in the industry is a great economic loss. Factory sales managers often don't know what to do. A tremendous educational program is needed to bring automobile merchants up to the grade of other merchants. It has been demonstrated that membership in an association extends a dealer's longevity. The man who has the courage of his conviction that he is selling transportation can dig prospects out of all kinds of odd corners. There is no buyers' strike. Everybody wants cars. It is mostly a question of finance. Everyone who owns an open car wants a closed car. That alone provides endless prospects."

Referring to the subject of legislation and unfair taxes on automobiles Moock said:

"Just so long as business men continue to elect politicians to office just so long will we have politics in business."

He said the automotive industry was singled out for attack because it was least organized.

Moock asserted that the used car problem is one for the entire industry to solve because 90 per cent of the sales made involved trade-ins. In many cases the man buying a car is a better business man than the one who sells.

He, too, stressed the importance of service and he invited the parts makers to co-operate in conducting a course of shop lectures for mechanics.

Many of the speakers brought out the point that it is the retail sale which is vital to the industry. Charles Burr, treasurer of S. K. F. Industries, New York, declared that if the merchandising of automobiles had been on a scientific basis much of the industry's troubles could have been avoided.

"We must address ourselves," he said, "to the question of how to strengthen

this weak spot in the automotive industry."

Utility, price, comfort, safety and low upkeep costs in the order of their importance were given by J. M. McComb, vice-president of the Crucible Steel Co., as the prime essentials for a motor car. He predicted that lower costs would stimulate buying. This idea was echoed by others. It was agreed there must be immediate deflation of prices all along the line.

There wasn't a note of pessimism in the whole convention. It was agreed that the worst is over, that the tide has turned and that prosperity is coming back. No one expects a boom and no one wants one. No one has any illusions. As H. H. Rice, president of the Cadillac Motor Car Co., expressed it, "We can expect a fairly decent business from now on."

Business is better now than it was expected to be a month ago, members of the association admitted, and it has been better for the last three months than it was expected to be. None of the parts and accessory makers have exaggerated expectations for the remainder of this year, but the accumulation of orders on their books is being gradually whittled down and they are getting some

## HERE are some of the striking statements made at the convention:

"The weakest link in the chain of automotive finance is that between the manufacturer and the dealer."—Charles Burr, treasurer S. K. F. Industries.

"A passenger chassis cannot be made to do double duty in the field of freight transportation."—Ezra W. Clark, advertising manager Clark Equipment Co., Buchanan, Michigan.

"It must be admitted that standardization has placed the American car in the pre-eminent position it occupies in the world."—G. Brewer Griffin, manager automotive equipment department, Westinghouse Electric & Mfg. Co.

"We must stop comparing business and profits with 1918 and 1919 and compare them with 1913, for 1913 was last year for us."—J. P. Harris, vice-president Union Trust Co., Cleveland.

"Credit dealt industry a severe blow but only through credit will the results be warded off."—C. W. Dickerson, vice-president Timken-Detroit Axle Co.

"There should be not merely a mechanical service but a morality of service. Gyp the Blood has got to go."—F. S. Armstrong, sales manager, Vesta Battery Corp.

new business. They expect the sale of automobiles to go along for the next three months pretty much as it has for the past four.

The optimism which radiated from the meeting wasn't based merely on hope, it was founded on fact. Fundamental business conditions are better not only in the United States but throughout the world. Improvement will be gradual and there will be ups and downs, but there will be no great slump. The industry has been through a terrific storm and has come through it sound as a rock, although more or less battered.

It was admitted that the mortality attendant upon the storm, as represented by failures, had been surprisingly small. It is true that the safes of the parts makers are well filled with gold notes and bonds, promissory notes, trade acceptances and all kinds of I. O. U.s, but they are not in any sense discouraged.

J. P. Harris, vice-president of the Union Trust Co., Cleveland, who spoke on business conditions from the standpoint of the banker, radiated good cheer. He said he was a firm optimist from all standpoints.

"Some of you may think business is rotten," he said, "but you are so close to it you see the specks on the window. There never was more ground for optimism. The banks will not be stingy with legitimate enterprises, but there will be no loans to manufacturers or merchants who are trying to maintain war prices and refuse to take their losses. The crux of the situation is that you have got to stop comparing with 1918 and 1919. We must compare with 1913. That was last year for us.

**"The worst is over. There is evidence that the supply of credit to grease business has passed normal. The end of the bear market is at hand. Security markets are predicting a revival of business. We may be certain that by late winter or early spring we will be looking at the sunshine with the clouds behind us. By another summer we will be getting back to increased business.**

"All labor must be liquidated to equal the liquidation on the farms. All prices must be equalized with farm levels. The automotive industry will find the next year or two an era of tremendous competition and falling prices. Manufacturers must meet the price cuts of competitors. The parts makers must help. It will be a survival of the fittest. You must meet the competition of superior service. You must get rid of high-priced inventories and get labor down. The army of unemployed will take care of the wage question and bring wages lower.

"You must buy carefully and a shorter period must elapse between production and sale. There must be a rapid turnover for the next 8 or 10 years. You must clean out your stocks and turn them into cash. Everyone must preach optimism. You must convince yourself that the worst is over and that fundamental conditions are sound."

Efficient management, economical production and fair selling to meet competition were urged by M. A. Moynihan, secretary and treasurer of the Gemmer Mfg. Co., Detroit, who agreed that the worst is over.

"As parts manufacturers," he said, "we have our own duty and responsibility to our particular industry and to the entire field of automobile production. Whether we manufacture a fan belt or a motor, that particular unit should have behind it every essential of good design, good quality, economic manufacture and honest selling. This is essential if the automobile is to be maintained as the greatest utility of transportation at a cost within the reach of the average buyer and delivering more service per dollar of cost and maintenance than any other item of family investment. As makers of the component

parts, we have a large duty in bringing about this ultimate result. And our duty compels us further, as individual manufacturers and as an association, to stamp out those practices which threaten our industry—stock-jobbing, misrepresentation, illegal combinations, over-borrowing, under capitalizing, profiteering, contract breaking and the many other faith-destroying elements which have been encountered before and which will bob up serenely again if we are not on the job to promote and protect the name and character of our industry."

Rice, who spoke as the representative of the National Automobile Chamber of Commerce, said one of the wonderful things about the industry was the way it had worked together. The forbearance of the members of the M. A. M. A. in a difficult period had been noteworthy, he added.

"We have been going through a sort of moratorium," he said, "and there is much to be said on both sides as to whether the industry should live up to the letter of contracts. It is largely a matter of give and take. The tide has turned but it is not the occasion for too great optimism.

"My own business is better and we can expect a very decent business from now on. That is the message I bring you from the car manufacturers as a whole. We must be efficient ourselves and have everyone connected with us work hard. The increased efficiency of labor in our industry is striking."

In an open forum discussion on business conditions, G. Brewer Griffin, manager of the automotive equipment department of the Westinghouse Electric & Mfg. Co., said the standardization of a product so far as is possible directly benefits both manufacturer and user, as well as the producer of the raw materials that enter into it.

"The matter of standardization is a sensitive spot with many engineers," he said. "The old time engineer felt unless he could design something that did not exist in the heavens above, the earth beneath, or the waters under the earth, he was not performing in a way that would warrant his title of engineer. Possibly this attitude is right so long as the product manufactured is sold and serviced solely by the individual or concern producing it, but just as soon as distribution of such product becomes general and the service requirements are national or international, then the nearer we approach to accepted standards the better it will be for everyone concerned.

"Whether the manufacturer is entitled to furnish all service parts of his original manufacture or not depends upon two things; first, control by patents which would shut out the furnishment by anyone else; but, second, and most important, is whether he is worthy to receive this business and obtain it by the scope and quality of his service and the relations he maintains with his buyers and users. But I wish to state that I am no friend of the pirate parts manufacturer."

A. H. D. Atree, vice-president of the American Bosch Magneto Corp., in speaking of the "Personal Equation in Granting Credit," said:

**"Competition is growing more keen every day, and it might almost be said, with very few reservations, that any newcomer into any branch of the automotive industry should not be granted credit unless he can show:**

**"A—Quality product at an attractive price.**

**"B—An existing or immediately prospective potential demand.**

**"C—Ample financial resources to meet his obligations and setbacks.**

(Continued on page 583)

# Cadillac Model 61 Embodies Design Refinements

Changes include use of 33 x 5 tires, reduced body height and redesigned rear axle. Slight engine changes have been made in connection with camshaft lubrication, water drain valves, and other minor features. The carbureter now has thermostatic control on auxiliary valve.

By J. Edward Schipper

**R**EFINEMENTS in design embodied in the new Cadillac model make for more pleasing appearance, better performance and—in the case of certain parts—longer life. No radical changes have been made. The eight-cylinder type of engine, which has been used since the first car of this type was introduced in 1914, has undergone very few changes. The plan of power transmission also remains fundamentally the same and no basic features of design have been altered.

All Cadillac cars are now mounted on a 132-in. wheelbase chassis. Formerly a 125-in. wheelbase was used to take care of certain body types, but now all are of the same length, permitting of a standardized manufacturing program as far as the chassis is concerned. By the use of wheels equipped with 33 by 5-in. tires in place of the 35 by 5-in. formerly employed, the height has been reduced slightly. Only one engineering change was necessitated by this lowering of the car—decreasing the size of the rear axle housing in order to maintain the same road clearance as in former models.

In redesigning the rear axle, increased bearing surface has been provided for the pin on the torque member. In general, the axle is the same as in previous Cadillacs, Timken bearings being used throughout. Bearings are on both sides of the pinion. Three gear ratios are offered, namely, 4 10/11, 4 1/2 and 4 2/13 to 1.

Engine changes are of a detail nature, the only internal alteration being in connection with the oiling system. For camshaft lubrication, the oil is now led through the hollow camshaft instead of through an independent copper lead. Sub-leads were formerly brought from the main lead to the camshaft bearings. In place of these, holes are now drilled in the camshaft at the bearing points, and centrifugal force helps to carry the oil to these. The front end driving chains and the air pump in the gasoline system are oiled from the camshaft. This eliminates the leads

and has the advantage of simplicity. Outside of the change in the camshaft oiling scheme, the oiling system remains the same.

Another change in the engine, made for the sake of convenience and accessibility, is in the arrangement of the water drain valves. It is now possible to open and close the valve at the bottom of the pump by means of an ordinary screwdriver from a position above the frame. An indicator dial showing the position of the valve is now in plain sight. It bears three inscriptions—fill, close and drain. The circulation of water to each cylinder

block is independent, as there are two independent pumps. Thermostatic control of the cooling liquid is continued, with improvements. Instead of the valves being mounted directly on the syphon thermostat as formerly, there is now a connection with a sort of universal action, so that any warping of the syphon can-

A smaller wheel gives the new Cadillac lower body lines

not cock the valve on its seat. The housing containing the syphon thermostat and the valve is located on the cover of the water pump. In draining the water system, it is necessary to force the thermostat valves from their seats. This is taken care of by the shaft operated by the screwdriver in draining the system, and when the dial is in the *drain* position the drain port is not only open at the bottom for the water to flow out, but the thermostatic valve is also lifted from its seat. The condenser, the purpose of which is to prevent the loss of anti-freeze solution by evaporation, which was used on former models, is still employed.

Changes in the carbureter (which now has a 2-in. intake) include the provision of thermostatic control for the tension on the auxiliary air valve spring and also for regulating the effectiveness of the accelerating pump, which is a feature of the Cadillac carbureter. Referring to the sectional view of the carbureter, it will be noticed that the manual setting for the air valve is continued, but

Sectional view through carburetor

Two views of the water pump

superimposed on this manual setting is a thermostat which alters the tension on the air valve spring in accordance with temperature requirements. On a cold engine, the spring tension is increased, thereby causing increased resistance to the opening of the auxiliary air valves; in warmer weather the effect is the reverse, thus tending to make the mixture leaner.

The thermostat on the accelerator pump, which is located in the fuel chamber, operates a shutter which covers and uncovers a vent, thus increasing the effectiveness of the pump when the engine is cold, and decreasing it when the engine is warm. The object of this acceleration pump or throttle pump is to force gasoline through the spray nozzle when the throttle is opened quickly for acceleration. When the throttle is opened slowly, the pump has practically no effect on the gasoline. The throttle pump is inter-connected with the throttle and its function is to force compressed air into the float bowl. When the thermostat comes into effect and opens the vent, the pump operation is materially reduced. It is claimed that these changes reduce the warming-up period materially.

In the electrical equipment of the car there have been some minor changes. A two-pole generator is used instead of four-pole. Tilting headlights are continued, but have been materially changed in design, for durability and simplicity. The headlights are now mounted on a tubular cross-member which extends across the entire front of the car at midheight of the radiator. The headlamps are mounted on posts which permit of individual adjustment of each lamp. The tilting mechanism for the reflector has been improved so that wear in the operating linkage does not affect the uniformity of tilt in the reflectors. This is accomplished by so arranging the tilting mechanism that it swings over a center to a uniform degree.

Chassis lubrication has been improved by the use of better grease cups in some places and the elimination of others. Grease or oil lubricated bearings on the clutch and brake pedal shaft, clutch release shaft and brake rocker shaft are replaced by bronze bushings with graphite inserts. In the new type of grease cup, a tight fitting piston operating within a cylinder forces grease to the bearings under a pressure claimed to be between 300 to 400 lb. per sq. in. The piston in the grease cup is operated by a small wing nut.

A new chain drive adjustment is provided. The Cadillac chain is so designed that when properly adjusted enough play is left in the chain to permit an oscillation of 1 in. at the periphery of the fan. The adjustment is by means of an eccentric sprocket shaft. In the earlier models, the camshaft sprockets were integral and had their bearings directly on the camshaft. This is no longer the case. The camshaft sprockets now rotate upon eccentric surfaces located on a supporting member which is clamped into the crankcase by a locking device. The camshaft also rotates in a bearing carried in this support. By turning the eccentric surface by means of an adjusting worm the center distance between the crankshaft sprocket

The improved tilting headlights

Diagram of engine lubricating system

and the camshaft sprocket, or between the camshaft sprocket and the fan sprocket is increased, thus tightening the chain.

A great many detail changes have been made in the body and fittings of the car. The lowering of the car by the use of smaller wheels is reflected in the appearance of the car. The radiator is higher and the shoulders have been raised and rounded, with the result that the entire front end of the car is enlarged. This improvement in appearance at the front end has been further increased by the use of Bausch & Lomb optical lenses on the headlamps and the small side lamps. The lines of the fenders have been altered and the rear quarters of the enclosed bodies have been changed by greatly reducing the radii at the corners. Two new body styles have been added to the Cadillac line, a two-passenger coupe resembling the roadster in seat arrangement and storage space, and a four-passenger coupe in which entrance to the rear seat is secured by tilting the seat on the right side.

The body interiors have been entirely redesigned, particular care having been used in the selection of metal for fittings. All of the levers and bright metal interior parts are of Duralumin forgings. Owing to the non-corrosive quality of this material it is also used for windshield wing nuts, door handles, floor boards and kick plates under the doors. With the phaeton and sedan bodies is furnished a trunk rack of the same material, which gives six polished strips of aluminum running vertically on the rear end of the car between the tire carrier and body.

The entire front compartment has been redesigned. All of the fittings have been made uniform, the instrument board having been made to conform with the general scheme of decoration of the car. The steering wheel is now made entirely of selected walnut, even to the spokes. The horn button is of the same wood and the rim of the wheel is molded to fit the driver's hand and is as free from metal as it is possible to make it. The tilting feature of the steering wheel, a characteristic of former Cadillacs,

Sectional view of the Cadillac rear axle

The improved carburetor with thermostatic control

has been discontinued. The spark and throttle lever mounts have been altered; the quadrant has been replaced by a compact arrangement which brings the control in closer to the steering column. Only the finger grips of the new levers are exposed.

The instrument board is convenient and simple. There is a jet black oval plate in the center in which are mounted the switch levers and switch lock. On this plate is the Cadillac crest, finished in enamel and gold. Below the oval plate and at either side are the buttons for controlling the fuel mixture when starting and for deflecting the headlights. The dials of the ammeter and pressure gages are combined in one instrument at the left, which balances a similar circle containing the clock and speedometer on the right. A single lamp is carried directly over the combination switch plate to illuminate the dash. All of the detail work about the front compartment has been gone over. The pedal pads are forgings of Duralumin and the adjustment for the extension of the pedals has been discontinued, for the sake of cleaner design. The hand brake now has a polished nickel grip in place of rubber. A new transmission lock has been provided, supplementing the switch lock, and the switch key fits the transmission lock as well as the tire lock. The ventilator has been increased in capacity and is now operated by one motion of a small lever placed beneath the cowl. A windshield cleaner and an adjustable rear view mirror on the windshield are included in the equipment.

All of these changes have been made without altering the specifications of the car. The price and weight of the car also remain the same.

The Cadillac chain adjustment

Camshaft sprockets N and L are not integral nor do they bear upon the camshaft as in earlier eight-cylinder construction. The camshaft sprockets have their bearings and rotate upon eccentric surfaces H and F of the support C. The support C is clamped into the crankcase by the locking collar A. The camshaft J rotates in bearings carried in the support C. Shafts E and B fitted with worm gears I and G meshing with teeth cut upon the flange D of the support C and with teeth cut upon the collar serve as means whereby the collar A may be loosened or tightened and the support C turned. Turning the support C by the shaft E, which may be done after the collar A is loosened by turning the shaft B in a clockwise direction, raises the sprocket N and lowers the sprocket L as these sprockets have their bearings upon eccentric surfaces of the support C. In other words, the center distances are increased between the crankshaft sprocket T and the camshaft sprocket N and between the fan sprocket S and the camshaft sprocket L. The chains are thus tightened. Camshaft sprocket N is driven from the crankshaft sprocket T by the chain K. Camshaft sprocket L is driven from camshaft sprocket N by a universal cross M through lugs on the inner surfaces of these sprockets. Camshaft J is driven by camshaft sprocket N through the universal cross O and the driver P. The fanshaft sprocket S is driven from the camshaft sprocket L by the chain R.

## Fellowships in Highway Engineering and Highway Transport

THE following Fellowships will be awarded by the Board of Regents of the University of Michigan not later than Nov. 1, 1921:

The Roy D. Chapin Fellowship in Highway Transport, which is offered to provide for the investigation of an approved subject relative to highway transport.

The Roy D. Chapin Fellowship in Highway Engineering, which is offered to provide for the investigation of an approved subject relative to hard surfaced roads and pavements.

Two Detroit Edison Fellowships in Highway Engineering, which are offered to provide for the investigation of approved subjects relative to moderate cost country roads.

General conditions: Each Fellowship pays the sum of \$250 with an allowance of \$50 for expenses. The holders of these Fellowships do not have to pay tuition fees. A

Fellow must hold a Bachelor's Degree from a college of recognized standing. He must enroll as a graduate student in highway engineering or highway transport and as a candidate for the degree of Master of Science or Master of Science in Engineering. He must be in residence for one of the following periods: First semester (October to February); winter period (December to March); second semester (February to June). An application for a Fellowship must include a concise statement of the candidate's educational training and engineering experience, and three references. Applications and requests for information pertaining to the twenty-five advanced courses in highway engineering and highway transport offered by the Graduate School should be sent to Arthur H. Blanchard, at the University of Michigan, Ann Arbor, Mich.

# Many Changes Shown in New Chevrolet

The most important changes in this new model are in the body and its fittings. The front seat has been lowered 4½ in. and the top and back curtains are of new design. Engine and transmission are assembled in a unit. Spiral bevel pinion and ring gear replace straight bevel drive.

A NUMBER of improvements in design have been made in the Chevrolet "Four-Ninety" model, intended to add to the comfort, quietness and life of the car.

Special attention has been given to the steering knuckles, which are now decidedly more robust. The steering knuckle arms are given a heavier section and are fitted to the knuckles with a tapered joint. The pivot bolts are increased in diameter from ½ to 9/16 in. and are mounted in hard rolled bronze bushings. Both bearings on the knuckle are now of taper roller bearing type, with smooth bore. A grease cup is now assembled on the knuckle in such a manner that it is readily accessible for refilling and both the upper and the lower bushings are assured of a sufficient supply of lubricant, it is claimed.

Up to now the Chevrolet has adhered to the straight bevel drive, but the new model carries a spiral bevel pinion and ring gear. The chief advantage of this drive is, of course, its more silent operation, but the spiral bevel gears are also materially stronger. With this kind of drive the end thrust on the pinion is considerably greater, and this has been taken care of by providing the pinion with an annular ball

bearing capable of taking a great deal of thrust.

To overcome trouble due to want of alignment between the engine and transmission, these two parts are now assembled in a unit with the supporting members; they are drilled and assembled in a unit jig which is said to assure alignment within 0.005 in., and it is claimed that this alignment is maintained in use. A hand lever is now provided for the emergency brake, and the pull rod assembly has been redesigned. The brake pedal has also been slightly changed. The brake shaft brackets are reinforced so as to be able to better withstand the pull of the brake cables.

Rather important changes have been made in the body and its fittings, the front seat has been lowered 4½ in., to obtain a higher seat back without increasing the height of the car. To gain more leg room the cushions are placed at an angle, and the steering column has been shortened to correspond to the new position of the seat. For the same reason the windshield has been lowered.

Holton hood catches are now used, the gas tank capacity has been increased to 10 gal., the top and back curtain are of new design, and Gipsy curtains have been added.

# Springing and Other Refinements in Motorcycle Design

The need for springing of motorcycles, especially when used on rough roads or when heavy loads are to be carried, is emphasized and several types described. Lubrication and other items are discussed.

By G. H. Savage\*

**A**FTER having ridden practically all kinds of motorcycles in France over all sorts of conditions of roads, the author's criticism is that the springs were not responsive at all to the small and average shock, though they came into action for hard shocks, and for the very severe shocks the springs either came up solid, when acting in compression, and the frame took the final blow, or, in the case of the extension type, the springs were overstressed. If a stop was fitted on this latter type, the frame again took the final blow.

The allowable movement from the normal, under load, was on the average from 1 in. to 1½ in. In the author's opinion it is impossible to design a spring with this allowable movement that will be responsive to the full range of shocks. In consequence the springs used were too stiff, parts broke and shook loose, etc., and the springs themselves broke frequently.

With the helical spring acting in extension, on one or two types of machines the top and bottom ends of the

spring were bolted up solid. The front forks were connected to the head by links, the movement of the forks thus being along the arc of a circle with radius equal to the length of the link. If the two ends of the spring are in line with the spring straight, when the spring is extended under load one end will move along an arc, and it must move out of line with its other end, thus bending or distorting the spring as well as extending it. The angular movement of the spring ends can be altered slightly by having the top and bottom links of different lengths and at different angles in relation to each other, but with these modifications the spring still distorts, and this arrangement has its own objections. In such cases it is usual to have the spring bent when in the normal position, so that it tends to straighten when further extended.

These 2¾-hp. Douglas extension springs broke, as a rule, where the spring commenced to taper near the ends. On the latest Douglas 4-hp. machines the springs are all parallel, and the ends are allowed to swivel on pins; very little trouble has been experienced with this type.

On all the makes, with the exception of the Triumph and Douglas 4-hp., the linkage employed was too light, the chief faults being the small diameter of the spindles

\*Extracts from a paper presented before the Institution of Automobile Engineers, London. The author was attached to the British Mechanical Transport in France and had opportunity to observe the performance of motorcycles used on a large scale. The article is based upon observations made under severe conditions of service, both at the front and at base repair shops, where machines were in some cases redesigned as well as repaired and rebuilt.

Fig. 1—Douglas front forks with helical springs

Fig. 2—Springing 2¾ hp. model with laminated rear springs

Fig. 3—3½ hp. model with helical rear springs

Fig. 4—Front and rear springs on Royal Ruby Standard model

and the lack of a proper method of lubricating them. The author practically never saw a spring linkage taken to pieces, but that the spindles were dry.

On the later type Douglas 4-hp. machine, the spindles are of larger diameter and drilled up, the end of the spindle being screwed, and on this a grease cup fitted; this is a big advance on previous practice, and very little trouble has been experienced with them.

On the Triumph machines the front fork was hinged at the bottom of the fork stem, a ball bearing, which stood up well, being fitted.

Except on the very earliest types of Douglas 2¾-hp. machines the author saw practically no cases on any make where the links had bent during ordinary wear and tear. The diameter of the spindle end, the thickness of the link at the eye, and the face on the spindle which the link came up against were all too small, and once the link started working at the eyes it usually meant new links and spindles to make a satisfactory job. The surfaces for taking side pressure were small, though any play developing could be taken up by washers, and later in the war some makers fitted hardened steel washers. The use of double coil flat spring washers between the faces of the castings and of the links was a good arrangement.

Saddle springs stood up well, but chiefly because the saddles bumped before the springs were overstressed.

A Douglas 2¾-hp. machine with two rear springs, one on each side of the rear wheel, is shown in Fig. 2. The forward ends of the springs rest on a bracket about 8 in. along the middle rail, the center of the springs being hinged to the seat pillar lug, and the rear ends attached to a stay that went over the wheel. The author did not test this machine himself, but has been told that the early reports were good. The next experimental Douglas machines that came out were 3½ hp. machines, fitted with helical rear springs, as shown in Fig. 3. The spring cages showed that the spring had been deflected to the end of its travel often and fairly hard. The machine was good and very comfortable to ride, but the springs were too stiff to be responsive to the light shocks.

Another spring frame machine tested was the Royal Ruby. This machine differed from the latest model shown in Fig. 4, chiefly in the position of the rear spring. It was approximately vertical then. It is now horizontal. The shackles were also different, but the front spring was much the same. This machine, as it came to the author, had had some fairly severe work to do. The only criticism was that the wheels were a little out of track and care had to be exercised when riding the machine. The machine was very comfortable, and very much less tiring to ride than one with a solid frame.

Another design of rear spring was especially fitted to a standard Triumph machine, the general arrangement of which can be seen in Fig. 5. The carrier and rear mudguard were unsprung. The spring had a flat end,

with no eye or shackle, but behind the end was a cross bar, which engaged the spring on rebound. The difference between the riding qualities of this machine and those of a standard Triumph was enormous.

As higher speeds became more common the springing must be developed not only for comfort but to enable the mechanical details to better stand up to their work. It does not appear that this should add much to the cost of the machine as there will certainly after a time be a saving by making the whole machine lighter. But even if the first cost is greater, the springing if well designed should be a great asset.

Manufacturers should decide upon the permissible movement from the normal under load for the front and rear forks of the machine. The author suggests 2½ in. to 3 in. for the front forks and 3½ in. to 4½ in. for the rear. The Beardmore Precision Co. informs the author that they have experimented with larger deflections than they at present allow on their standard spring frame machine, Fig. 6, and have rejected them. They found that the movements were, in their opinion, too great for the short wheelbase of a motorcycle, that the periods were too slow and the springs too heavy. On their standard machines they allow a maximum movement of about 1½ in. for the front wheel and 2 in. for the back wheel.

The Royal Ruby Cycle Co. says that the maximum allowable movements are about 3 in. on front and rear wheels. The Beardmore company says that in its experience the steering is hardly affected by the large movements. This agrees with my own experience.

A considerable number of machines are now fitted with both horizontal and vertical springs on the front forks. The wheel is thus sprung in two directions. That these springs do useful work can be appreciated by rid-

Fig. 5—Rear spring as applied to Triumph machine

Fig. 6—Springing used on standard model of Beardmore machine

ing a machine so fitted. In the author's opinion, however, these are only useful when vertical springs are too stiff, that is, on a front fork fitted with reasonably flexible springs the horizontal springs would not be required, especially as the motorcycle front forks are already at an angle of about 30 deg. to the vertical.

There are three distinct types of front forks. The most usual is the parallel link type, where the links connect from the top of the front forks to the head of the frame. Then comes the type used on the Triumph and the B.P., where the front fork is hinged at the crown, and lastly the design which seems to be popular on American machines, and which is also embodied in the Phelan and Moore front forks, where the connecting link comes straight off the wheel spindle. It would be hard to say which type is best, as they are, in common with most engineering problems, a compromise of the three; the author prefers the first mentioned, where the links bridge from the top of the front forks to the head. The bearings in this type are long, easy to lubricate, easy to adjust, accessible, simple and out of the dirt, and in practice they stand up quite well. The tendency now is to make the link spindles of larger diameter, as on the Douglas type shown in Fig. 7. This is a move in the right direction. The spindles will, however, stand still further increase in diameter. Some makers are also providing an easy adjustment for taking up any side play that develops. This is satisfactory as long as it insures that the links are still held solidly on the spindle ends, or on a connecting tube in some designs. The links are preferably screwed up against shoulders. In the type of front fork used by Triumph a large proportion of the road shock must be transmitted direct to the frame, or at any rate a great deal more than on the other two designs mentioned. The more flexible the spring, however, the less will this be felt. When the front fork is hinged at the steering crown, there is the advantage of only one bearing against four, see Fig. 8. and this bearing can be made long and of large diameter.

On the P. & M. and American type there is the advantage, when using helical springs, that the angular movement of one end of the spring in relation to the other when being compressed or extended is less than with the first mentioned link type. Another advantage is that there will be slightly less unsprung weight. When the wheel is in front of the bearing it hinges from, it appears that one advantage of this type is destroyed; if the wheel is behind the bearing, it is trailing, and its position could be such that it would be readily responsive to road shocks from a large range of directions.

Whether to make the springs adjustable for different weights and for bad roads is a question. The Royal Ruby Co. embody such an adjustment in their machine,

as shown in the lower part of Fig. 4, and it is without doubt a desirable refinement. If, however, a low priced machine is being built, the author thinks it unnecessary.

Rear springing on a motorcycle is a comparatively new feature. The considerations in the design seem to be accessibility for viewing, repair and lubrication, efficiency, clean appearance and cheapness. The maximum allowable movement from the normal should, the author thinks, be from  $3\frac{1}{2}$  to  $4\frac{1}{2}$  in.

Vitally connected with the problem of rear springing is the practice which is becoming more usual each day—that is, transporting an extra passenger on the carrier. It seems absolutely unreasonable to expect the manufacturer to design a machine to give good springing with one passenger, and also with two passengers, one sitting on the carrier. It is, as a matter of fact, impossible. The author prefers the leaf spring. Satisfactory designs have, however, been got out with helical rear springing, and there is no reason why they should not give very efficient results. The helical rear springs on the Douglas  $3\frac{1}{2}$  hp. machine are shown in Fig. 3. The author has ridden one of these machines and found it very comfortable and well made. The only criticism is that the springs were, of necessity, rather stiff, the allowable movement of the wheel being small. Another machine which has helical rear springing is the Matchless. On this type at present the ends of the springs are held solidly. In the normal position they are out of line, and as the spring is further compressed they move into line. The carrier is sprung on this machine, so that if an extra passenger is transported the springs on the rear wheel have to support the extra weight.

Fig. 7—Front fork links and spindles used on Douglas machines

Saddle springs act as supplementary springs or shock absorbers for the rider only. These saddle springs are part of the springing, but it does not follow that supplementary springs would not be desirable in combination with the main spring, or that the main spring can be stiffer, for in this case the power unit, gear box, etc., which weigh about one and a half times as much as the average rider, would still be badly sprung, and apart from the bad effect of road shock to these units, the rider would feel the vibration. What should be aimed at is to spring the machine and rider as perfectly as possible, and simply look on the saddle springs as the equivalent of the cushion springs on a car.

It would undoubtedly be preferable to have the carrier as sprung weight, providing the machine is ridden solo. If it is sprung it saves the carrier bags and their contents considerably. While the present tendency of carrying an extra passenger continues, the carrier must be unsprung, as a protection to the manufacturer.

The backstand should, if possible, be sprung, thus doing away with the clip on the rear of the mudguard, which is intended to hold the stand up. This spring clip is now being replaced by a positive screw fixture,

but this is a nuisance and is always exposed to the wet and dust.

On the majority of machines the main spindle bearing is a plain bearing (examples of which are shown in Fig. 9) though on at least one design ball bearings have been fitted. All these bearings should be of considerably larger proportions, and as long as possible, and ample faces for the side thrust should be allowed. This bearing is an extremely important feature; if it develops wear soon (possibly through not being well lubricated, or through careless usage) slack, which will destroy the balance of the machine, will be set up. On account of the under lubrication which this main spindle bearing, in common with all others, will undoubtedly receive, the author favors ball bearings as on the Beardmore Precision machine.

The main bearing should be as near to the center of the gearbox pulley or chain wheel as possible. In the normal riding position the center of the wheel should be  $1\frac{1}{2}$  in. to 2 in. below a line produced from the gearbox pulley through the center of the main spindle bearing. Actually, the shortening of the distance between the gearbox pulley wheel and the wheel center is practically negligible even with a 4 in. movement, and the author has never had trouble with a belt slipping on this account. A belt is elastic, and a chain never runs dead tight. Wheel spindle bearings had to be replaced very often. They were not large enough to long withstand vibration.

Some makers are seriously considering lubrication facilities. A great many, on the other hand, even on their latest standard models, fit lubricating means which are useless. They do not seem to realize that unless it is possible to lubricate the part with absolute minimum of trouble to the rider, and unless the system is efficient, the part will go unlubricated. The design in which there is simply a small oil-hole, covered by a pivoted flat spring, is bad in practice, as the oil can end never fits the hole and the hole also holds practically no oil, and in consequence most of it simply runs over the outside. Fitting absurdly small grease cups is another favorite practice. The author favors an oiler with the hinged lid, which is ideal for the lazy man, or a grease cup of reasonable dimensions.

During the war, in France, frames were a constant source of trouble through the tubes breaking, or the frames themselves distorting and twisting; the front down tube was the weakest point and it usually broke just below the head lug. It is possible that the heating in the process of brazing would, by annealing the tube, destroy some of the extra tensile strength of the solid drawn tube. In any case tubes of a heavier gage stood up to their work much better.

The front fork stems broke very seldom, but the same cannot be said for the ball races in the head. These were very poor, and after every 200 or 300 miles riding play developed and the races had to be adjusted. When

Fig. 8—Front fork construction used on Beardmore machines

this had been done several times it would be found that all the side play could not be taken up and new races were necessary.

Repairing wheels and scrapping them kept a small army of men busy. While many were damaged in collisions, their number was small compared with those that failed through average running. Practically every rim that came in was badly dented. The spokes were loose and often broken, which of course did not help the rim to stand up to its work, but both were at fault, as the spokes were too light a gage. Later on they were made heavier by some manufacturers.

Mudguards had to be replaced very often, as they either broke or cracked and tore away at the point where they were attached to the frame and stays; the method of attachment was usually very poor, and does not seem to have received the attention it deserves at the hands of the designer.

It is generally agreed that larger tires are more economical in the end and give easier riding.

Fig. 9—Examples of main spindle bearing

# Gearing Calculations by the Compressive Stress Method

## Part II

The capacity of gears cannot be accurately determined by the bending stress method for bending stresses are not a true measure of wearing qualities. The maximum surface pressure, or compressive stress, must be considered if tooth wear is to be kept within proper limits.

By Joseph Jandasek\*

**G**EARS cut from cast iron or cast steel are not used in vehicle construction for transmitting any great loads. However, for the sake of completeness, and also to clarify the compressive stress method, the values for allowable compressive stresses for cast iron are given in Table I. Here we can see that while the factor of safety for bending stresses at low speed, up to 100 ft. per min., is about 3—the maximum allowable bending stress being 8000 lb. per sq. in.—the safety factor for compressive stress is only about 2, the maximum allowable stress being 55,000 lb. per sq. in. However, where it is necessary continuously to transmit almost 100 per cent of the full load, the maximum compressive stress must be reduced to 32,000 or 33,000 lb. so that the safety factor for compressive stress for cast iron will be 3 also.

As for gears cut from soft cast steel, unhardened, their teeth can be subjected to static bending stress up to 20,000 lb. per sq. in., leaving the safety factor about 3 as far as strength is concerned. Checking for capacity, however, this corresponds to a compressive stress of about 125,000 lb. per sq. in., which is entirely too high for cast steel untreated. This fact has been confirmed by practice, which shows that soft steel gears are not suitable for the continuous transmission of heavy loads, because of their rapid wear.

If, for some reason, unhardened steel is to be used for gearing, a maximum compressive stress of 40,000 lb. can be allowed for ordinary cast steel and 50,000 lb. for high carbon cast steel, and teeth proportioned on this basis will be durable.

\*Engineer, Republic Motor Truck Co., Inc.

Fig. 15—Diagram of bevel gear set

### Capacity of Bevel Gears

The bevel gear tooth decreases in pitch uniformly from the outer end, where the pitch has the nominal value, to the apex of the gear cone. In Fig. 15,  $r'$  and  $R'$  represent the pitch radii on the normal cones and  $r$  and  $R$  are the pitch radii.  $L$  represents the outer pitch cone radius,  $l$  the inner pitch cone radius.

Now let us take any infinitely small section at the point  $X$  of the tooth at the distance  $x$  from the apex. The tangential pressure  $dW_c$  which this section sustains is also infinitely small and can be found by equation (6), because for an extremely narrow width of face  $dx$  bevel gears can be treated like spur gears, the only difference being that the pitch diameters on surfaces at the section  $dx$  of the normal cones are used in place of pitch diameters in the case of spur gears.

Thus for the section  $dx$  we have:

$$dW_c = 10^{-8} C_x^2 p_x dx \frac{n_x}{1 + \frac{r'_x}{R'_x}} \text{ for compressive stresses, and}$$

$$dW_b = S_x dx p_x y_x \text{ for bending stresses,}$$

where the index  $x$  means that the value of each particular dimension ought to be taken to correspond to section  $dx$ .

From Fig. 15 we see that the values of  $r_x$ ,  $R_x$ ,  $C_x$ ,  $S_x$ ,  $p_x$  decrease uniformly from the outer end to the apex. Hence

$$C_x = \frac{x}{L} C \quad p_x = \frac{x}{L} p$$

$$S_x = \frac{x}{L} S \quad y_x = y'$$

$$r'_x = \frac{x}{l} r' \quad n_x = \frac{n}{r} r'$$

$$R'_x = \frac{x}{L} R' \quad a_x = \frac{r'_x}{R'_x} = \frac{r'}{R'}$$

Of the above  $y_x$  is constant for any section, depending only on the number of teeth

$$n' = \frac{n}{\cos \alpha} = n \sqrt{1 + a^2}$$

$a_x$  is a constant.

Therefore,

$$dW_c = 10^{-8} C^2 \frac{x}{L} p \frac{x}{L} dx \frac{nr'}{r \left( 1 + \frac{r'}{R'} \right)}$$

Fig. 16—Diagram of contact relations in spur gears, pinion and rack and pinion and internal gear

and

$$\frac{r'}{L} = \frac{r}{R} = a = \frac{r'}{\sqrt{r^2 + R^2}}$$

$$\frac{R'}{L} = \frac{R}{r} = \frac{1}{a} = \frac{R'}{\sqrt{r^2 + R^2}}$$

Then

$$r' = \frac{r}{R} \sqrt{r^2 + R^2} = r \sqrt{1 + \frac{R^2}{r^2}}$$

and

$$\frac{r'}{R'} = a^2 = \frac{r^2}{R^2} = tg^2 \propto \dots \dots \dots (9)$$

Hence  $r' = r \sqrt{1 + a^2}$

Substituting this in the equation for  $dW$  we have,

$$dW = 10^{-8} C^2 p \frac{n}{\sqrt{1 + a^2}} \frac{x^2}{L^2} dx$$

$$W = 10^{-8} C^2 p \frac{n}{\sqrt{1 + a^2}} \int_l^L \frac{x^2}{L^2} dx$$

$$W = 10^{-8} C^2 p \frac{n}{\sqrt{1 + a^2}} \left[ \frac{L^3 - l^3}{3L^2} \right]$$

Placing  $L - l = f$

$$W_c = 10^{-8} C^2 pf \frac{n}{\sqrt{1 + a^2}} \left[ \frac{1}{3} + \frac{l}{3L} + \frac{f^2}{3L^2} \right]$$

lb. per sq. in. (for bevel gears).

And, finally, for calculating the capacity we get,

$$W_c = 10^{-8} C^2 pf \frac{n}{\sqrt{1 + a^2}} B \dots \dots \dots (10)$$

where  $n$  = number of teeth in pinion,  
 $B$  = reducing face factor.

The capacity of bevel gears is expressed by almost the same formula as the capacity of spur gears, the only difference being that  $\sqrt{1 + a^2}$  is put in place of  $(1 + a)$  and the whole expression multiplied by coefficient  $B$ .

In a similar way we can find the equation for calculating the strength of bevel gears according to bending stresses:

$$dW_b = S_x p_x dx y'_x$$

$$W_b = Sp y' \int_l^L \frac{x^2}{L^2} dx$$

If we integrate this expression between limits  $x = l$  and  $x = L$  and again place  $f = L - l$  we obtain for the strength

$$W_b = Sp y' fb \dots \dots \dots (11)$$

(for bevel gears).

To be absolutely correct equations (10) and (11) should also contain a factor depending upon the number of teeth in contact at a time, which factor varies but slightly, and a factor representing influence of speed, which unfortunately is uncertain.

The uncertainty regarding the influence of these two factors on the strength of the gears makes it permissible to neglect them.

As regards the maximum allowable compressive stress  $C$  and the bending stress  $S$  for straight bevel gears, these cannot be taken as high as for straight spur gears, because the increment load and the pressure on the face are larger, owing to the greater inaccuracy, the misalignment and the more difficult adjustment of the mesh.

#### Comparison of Compressive and Bending Stress Calculation

We will now compare the calculation of gears by the compressive stress method, the applied load being  $W_c$ , and by the bending stress method, the applied load being  $W_b$ .

For  $W_c$  we have (equation 6)

$$W_c = 10^{-8} C^2 pf \frac{n}{1 + a} \text{ lb.}$$

(for steel spur gears with a 20 deg. pressure angle) and for  $W_b$

$$W_b = Sp f 1.25 \left[ 0.154 - \frac{.912}{n} \right] \text{ lbs.} \dots \dots (12)$$

(for stub teeth with a 20 deg. pressure angle). By equation (10),

$$W_c = 10^{-8} C^2 pf \frac{n}{\sqrt{1 + a^2}} B$$

(for bevel gears with a 20 deg. pressure angle).

For the specific load per inch of circular pitch and per inch of face at the same velocity we have:

(for spur gears)

$$\frac{W_c}{pf} = 10^{-8} C^2 \frac{n}{1 + a} \text{ lb. per sq. in.} \dots (13)$$

(for stub tooth spur gears)

$$\frac{W_b}{pf} = S 1.25 \left[ 0.154 - \frac{.912}{n} \right] \text{ lb. per sq. in.} \dots (14)$$

(for bevel gears)

$$\frac{W_c}{pf} = 10^{-8} C^2 \frac{n}{\sqrt{1 + a^2}} B \text{ lb. per sq. in.} \dots (15)$$

In a similar way we can find the specific load per inch

Fig. 17—Showing how wear changes the involute tooth outline to a cycloidal outline

Fig. 18—Variation of allowable bending and compressive stresses with gear ratio and number of teeth

of diameter and per inch of face at the same velocity:  
(for spur gears)

$$\frac{W_c}{fd} = 10^{-8} C^2 \frac{\pi}{1 + a} \text{ lb. per sq. in.} \dots \dots (16)$$

(for stub tooth spur gears)

$$\frac{W_b}{fd} = S \frac{1.25\pi}{n} \left[ 0.154 - \frac{.912}{n} \right] \text{ lb. per sq. in.} \dots (17)$$

(for bevel gears)

$$\frac{W_c}{fd} = 10^{-8} C^2 \frac{\pi}{\sqrt{1 + a^2}} \text{ lb. per sq. in.} \dots (18)$$

Now we can proceed with a comparison of the two methods and their results.

Fig. 19—Variation of safe load per inch of face per inch of pitch with number of teeth

Keeping the gear diameter and ratio constant and considering solely the bending stresses, the designer can select either a wide gear with thin teeth or a narrow gear with thick teeth (see Fig. 1). The dimensions of face and pitch can be determined from equation (12) in such a way that the bending stress  $S$  is kept constant, hence the strength of the tooth remains the same, while it is evident that the compressive stress  $C$  in a comparatively narrow gear will by far exceed that in a wide gear; because, according to equation (4),

$$W_c = \text{const.} \frac{fr}{1+a}$$

Hence, keeping  $r$  and  $a$  constant, the allowable load decreases with the face width,

$$W = \text{const.} f$$

#### Influence of Ratio

The same pinion when meshing with a large spur gear possesses a greater capacity than when meshing with a small one. When meshing with another gear of the same size (ratio  $a = 1$ ), the capacity  $W_c$  of a gear is only one-half as great as when meshing with a rack, for which case  $a = 0$ , while the strength per inch pitch and per inch face for a gear with a definite number of teeth is constant (see equations 14 and 17) and the capacity  $W_c$  is only  $1/2.7$  as great as when in mesh with an internal gear of the ratio 1:4. This is a case similar to that of ball bearings in which we curve the inner and outer races in order to obtain a larger area of contact between balls and races, and thus obtain the maximum capacity for a given size of bearing. (See Figs. 16 and 17.)

This explains why we must use large gears for a ratio of 1:1 and it also explains why there is so much grief with mitre gears for the pulley drive on farm tractors. The capacity of mitre gears is only about 70 per cent that of bevel gears with a larger ratio (see Fig. 18). From equation (15) it may be seen that in the case of bevel gears the capacity remains almost constant for a large part of the range of ratios and drops quickly when close to the ratio 1:1.

Example 1: We found that for a certain compressive stress  $C$ , a 13-tooth pinion is satisfactory when working with a gear of four times the number of teeth. What is the number of teeth required for different ratios so that the compressive stress may remain constant?

The condition is

$$\frac{n}{1+a} = \frac{13}{1+1/4}$$

Generally, comparing with formula (16)

$$\text{(for spur gears)} \frac{n}{1+a} = \text{const.} \dots (18)$$

$$\text{(for bevel gears)} \frac{n}{\sqrt{1+a^2}} = \text{const.} \dots (19)$$

from which equations can be determined the smallest number of pinion teeth for any given ratio, or vice versa. For the results see Table IV.

#### Influence of Quality of Material

Owing to the fact that the capacity  $W_c$  of gears increases with  $C$ , materials of higher ultimate strength stand much more wear than those of lower ultimate strength.

While the allowable load  $W_c$  per inch diameter and per inch of face is constant for each ratio  $a$  (see formula 16), the strength  $W_b$  decreases as the number of teeth increases (see formula 17). Consequently, for a definite ratio and a given value of  $S$  there is a minimum number of teeth  $n$  for each particular ratio if the compressive stress  $C$  is not to increase above a certain safe value (see Fig. 18). Thus gears with a very small number of teeth, though they may be amply strong as regards fracture, wear out sooner than those with a larger number of teeth. Figs. 19 and 20 show how the safe load per inch of pitch and per inch of face increase with the number of teeth  $n$ .

Fig. 19 is constructed on the basis of  $C = 125,000$  lb. per square inch and  $S = 16,000$  lb. per square inch, the allowable stresses for spur gears when inclosed in an oil-tight housing. The further we go in our diagram above the curve  $W_b$ , the less the factor of safety from the standpoint of bending stresses; the further we go below that curve the greater the danger from the standpoint of compressive stresses. Each line representing the capacity  $W_c$  which corresponds to a given ratio  $a$  intersects the curve  $W_b$  in a different point; in other words, for the same maximum stress, each gear reduction  $a$  requires a different number of teeth  $n$ .

For economy in manufacture, the number of teeth in the gears must not exceed a certain maximum, which is given by the point where the curve  $W_b$  intersects the line  $W_c$  corresponding to that particular ratio. Otherwise the circular pitch is reduced and the bending stresses exceed the set limit. And, vice versa, for economy in the manufacture of gears calculated on the basis of bending stresses, the number of teeth must not drop below a certain minimum given by the intersection of the curves; otherwise the diameter is reduced and the compressive stresses will

TABLE IV  
Number of Teeth at Different Ratio A, Compressive Stress C Being Constant

a	n	N	a	n	N	a	n	N
.154	12	78	.63	17	27	1	21	21
.25	13	52	.72	18	25	..	..	..
.35	14	40	.825	19	23	..	..	..
.442	15	34	.91	20	22	..	..	..

be above those desired. Consequently, when the stresses  $C$  and  $S$  are given and we want to use the material to the best advantage, there is a certain number of teeth which must be selected for a given gear reduction  $(1+a)$ . This we obtain easily by placing  $W_b$  equal to  $W_c$ . Hence:

In other words, if a smaller number of teeth is desired than that obtained with given values of  $C$  and  $S$ , either the value of  $C$  must be increased or that of  $S$  decreased. Further, whenever gears have too small a number of teeth, excessive wear must be expected.

For our cases we get special equations:

$$(a) \quad C = 125,000, S = 16,000, \quad 1+a = \frac{7.8n}{1000y} \dots (22)$$

$$(b) \quad C = 90,000, S = 13,000, \quad 1+a = \frac{5n}{1000y} \dots (23)$$

$$(c) \quad C = 110,000, S = 14,000, \\ \sqrt{1+a^2} = \frac{6.9n}{1000y} \dots \dots \dots (24)$$

(for bevel gears).

The ratio of  $C/S$  is 900,000 to 1,000,000 for spur gears, 800,000 to 900,000 for bevel gears and 600,000 to 700,000 for internal gears.

Example 2. What should be the number of teeth

(a) for spur gears when  $C = 125,000$ ,  $S = 16,000$ , ratio = 1:4,

(b) for internal gears when  $C = 90,000$ ,  $S = 13,000$ , ratio = 1:4,

(c) for miter bevel gears when  $C = 110,000$ ,  $S = 14,000$ ?  
Solution:

(a) From curve A in Fig. 22 we find that the proper number of pinion teeth  $n$  for the case where  $1+a = 0.25$  is 14.

(b) From curve B we find that for a ratio  $a = -0.25$ ,  $n = 12$ .

(c) For miter gears we must use equation (24). For  $a = 1$  we get

$$\sqrt{2} = 6.9 \frac{n}{y}$$

This equation can be solved by the trial method; if we take  $n = 24$ , we find that

$$n' = 24 \sqrt{1+a^2} = \frac{24}{\cos 45^\circ} = 34,$$

then

$$y' = 0.118$$

and

$$\sqrt{1+a^2} = 1.405,$$

which is only a slight error for the required gear ratio. Hence, 24 teeth for each bevel gear is a proper number if the stresses  $C$  and  $S$  are to be in the right proportion. It is better, however, to use unequal numbers of teeth, making the driving bevel with 23, for instance, and the driven one with 25 or 24 teeth. In this way the action of the teeth will remain uniform longer and the life of the gears will be prolonged. If helical teeth are used, their number can be made a little lower, say  $n = 21$ , and both gears can be made of the same diameter to facilitate production. Even here, though, the action is more uniform with different numbers of teeth.

### Strength of Helical Spur Gears

One of the objectionable features of helical spur gears is the end thrust produced when the gears are in action. When helical gears are transmitting motion between two

TABLE V

Ratios Used by Author in Double Reduction Transmissions				
Speed	Total Ratio	Engine R.P.M.	Rear Wheels R.P.M.	Miles P. H.
Direct—High .....	1:5.76	1400	243	29
Direct—Low .....	1:13	1400	106	12.6
Low—High .....	1:30	1400	47	5.6
Low—Low .....	1:67.8	1400	20	2.0
Reverse—High .....	1:26.8	1400	52	6.2
Reverse—Low .....	1:60.8	1400	23	2.3

parallel shafts this end thrust can be avoided by placing two helices of opposite hand side by side, a form of gearing that has become known as "herringbone gears." The advantages of helical gears in general and of herringbone gears in particular can be summarized as follows:

(a) The action is continuous and smooth; there are no shocks from transference from tooth to tooth, hence the pitch can be made finer than with straight teeth.

(b) The teeth do not wear out of shape; the bending action of the load on the teeth is less than with straight gearing and does not fluctuate.

(c) The gears work silently and without vibration.

Fig. 20—Variation of safe load per inch of face per inch of pitch with number of teeth and gear ratio for different stresses than in Fig. 19

(d) The friction losses are reduced. Therefore, herringbone gears can be used for higher ratios and greater velocities than any other kind.

A herringbone gear tooth very seldom breaks off, because these gears are capable of transmitting from ten to twenty times the working load without fracture. This makes it plain that a calculation on the basis of breaking or shearing stresses gives little indication whether the gears are going to last or not.

As to the helix angle, there are good reasons why a moderate angle is to be preferred. In all helical gears the pressure acts in a direction normal to the teeth, and is the resultant of the tangential and axial pressures. The normal pressure becomes greater in proportion to the useful driving pressure as the helix angle is increased, while the available normal tooth section becomes less. Further, when the helix angle is considerably steeper than the angle of repose for the material in contact, there is a tendency for the teeth to bind with a wedge action. Herringbone gears with abnormally steep helix angles show loss of efficiency and increased wear from this cause.

In reference to the strength of helical spur gears the teeth need not have the same breaking strength as with straight spur gears, because they do not have to withstand the heavy and indeterminate stresses which arise from inequalities of angular velocity. The main thing is to provide against wear. By using a finer pitch, leaving the diameter the same, each tooth has its wearing surface reduced, but this is more than compensated for by the larger number of teeth simultaneously in contact. In high ratio gears, using pinions of exceptionally small diameters, the pitch is finer than for ordinary ratios, but the face width is extended to give the proper wearing surface.

An important factor in determining the proportions of teeth is the relation between the pitch line velocity and the maximum permissible specific tooth pressure. In present practice, the results of experience in the matter of safe working load under given conditions have been reduced to a relationship between pitch line velocity and shearing stress on the pitch line thickness of an imaginary straight tooth, assuming only one tooth in engagement at a time. The shearing stress is usually assumed to be an approximate measure of the specific tooth pressure and the relationship referred to affords a convenient means of arriving at approximate necessary dimensions.

Curve K in Fig. 13 and Table III give values of shearing stress in pounds per square inch on the pitch line section of an imaginary single tooth for corresponding pitch line velocities  $V$  in feet per minute. These values are entirely empirical, but are based on the results of practical experience.

The circular thickness of the gear tooth at the pitch line can be found by multiplying the circular pitch by 0.40 for gears with short addendum of 0.3 of its working depth

Fig. 21—Section through helical gears

and a 20 deg. pressure angle. Then the section area of the single tooth at the pitch line equals  $0.4 p_n f / \cos H$ , where the normal pitch  $p_n = p \cos H$  and the allowable tangential force at the pitch line

$$\frac{W}{\cos H} = 0.4 K p \frac{\cos H f}{\cos H} \text{ lb.,}$$

where  $K$  = shearing stress factor in pounds per square inch. Finally,

$$W = 0.4 \cos H K p f \text{ lb.} \dots \dots \dots (25)$$

(for herringbone gears).

As the herringbone gears usually have a standard angle of helix of 23 deg.,  $\cos H$  is almost equal to 1. Therefore, it is left out in the above equation and included in constant  $K$ . The formula then reads

$$W = 0.4 p f K.$$

Table III gives safe shearing stresses  $K$  in pounds per square inch for herringbone gears as found in standard text books on gearing.

By the compressive stress method we can, however, find an accurate equation for determining helical spur gear dimensions. In Fig. 21 let us pass a plane I, II, III, IV through a pair of helical gears perpendicular to the direction of the tooth which is in contact at the moment. The sections through both gears will be ellipses in contact along their minor axes, with major axes  $r/\cos H$  and  $R/\cos H$  and minor axes  $r$  and  $R$ .

It is known from calculus that the radius of curvature of an ellipse at the end of the short axis is (major axis)<sup>2</sup>/minor axis, or

$$\frac{r^2}{\cos^2 H} : r \text{ and } \frac{R^2}{\cos^2 H} : R.$$

Fig. 22

That is, the radius of curvature for the pinion is  $r/\cos^2 H$  and the radius of curvature for the gear  $R/\cos^2 H$ . We can now insert all necessary dimensions in equation (5):

$$\frac{W_c}{\cos H} = \frac{C^2}{16.3 \times 10^6} \frac{f}{\cos H} \frac{r}{\cos^2 H} \frac{1}{1 + \frac{r}{R}}$$

and

$$W_c = \frac{C^2}{16.3 \times 10^6} \frac{f r}{\left(1 + \frac{r}{R}\right) \cos^2 H} \dots \dots \dots (26)$$

Further,

$$2 \pi r = n p.$$

We then get:

$$W_c = 10^{-6} C^2 p f \frac{n}{(1 + a) \cos^2 H} \dots \dots \dots (27)$$

(for helical spur gears),

where  $p$  is not the normal but the circumferential pitch. Herringbone gears being in most cases used for high reductions we can omit the factor  $a$  and obtain:

$$W_c = 10^{-6} C^2 p f \frac{n}{\cos^2 H} \dots \dots \dots (28)$$

(for helical spur gears with large reductions).

Comparing equations (2) and (27), we can see plainly that the shearing stress  $K$  in equation (2) is only an approximate and comparatively poor measure of the compression on the tooth surfaces.

## Materials for Automobile Engines

ACCORDING to communications in German business papers, the following are specifications of materials used in German automobile engines:

Cast iron for cylinders and pistons—

Silicon	1.7 %
Phosphorus	0.4 0.5 %
Sulphur	0.07 %
Manganese	0.6 %
Graphite	2.6 %
Total Carbon	3 %
Combined Carbon	0.65 %

Cast iron for piston rings—

Carbon	2.6 %
Graphite	2.0 %
Combined Carbon	4.63 %
Manganese	1.3 %
Silicon	2.7 %
Sulphur	0.12 %
Phosphorus	0.1 %

Cast aluminum for crankcases—

Copper	6 %
Nickel	2 %
Silicon	0.01 %
Zinc	8 %

Remainder—Aluminum.

## Truck Axles

IT was stated in the Aug. 25 issue of AUTOMOTIVE INDUSTRIES that Timken axles were used on the two-ton models of the Independent Motor Co. This statement was incorrect. Axles made by the Wisconsin Parts Co. are used.

# Various Possibilities in Airplane Flying Controls

Means have been devised for relieving the pilot from judgment in the necessary movements of control mechanism, the purpose being to increase safety. Among the methods used are a pendulum connected to control levers, certain aerofoil arrangement, aerodynamic balancing mechanisms, servo motors, and gyroscopes. These devices are appraised here.

**S**INCE the first stages of development of the art of flying, inventors have been seeking an "open sesame" to automatic control. It has been considered that if some means could be devised to relieve the pilot from exercising judgment as to necessary movements of the control mechanism, possibility of accident would be removed and immediate advance in the art assured.

One method forwarded long ago, and periodically re-occurring in various forms, is through the use of a pendulum connected to the control levers. It is found, however, that the pendulum weights are as much subject to inertia forces as to gravity forces, and that the corrective gravity components are wiped out by the undesirable inertia components.

Automatic stability through aerofoil arrangement and design is also sought. No great difficulty is found in making an airplane inherently stable. But this is done with a sacrifice of controllability. The inherently stable airplane is "stiff" on the controls, and fights the pilot. A properly designed airplane is inherently stable only to the extent that it does not interfere with change of altitude at the will of the pilot. Extreme inherent stability is no more to be desired than is a motor car steering mechanism that would hold the car to a straight course, and resist every effort to turn.

## Balancing Mechanisms

Aerodynamic balancing mechanisms have also been designed, constructed and tried out. The net result, ordinarily, has been only "a long journey for a small load." One particular device of this type has attempted to secure lateral stability through aileron action from vertical fin forces. Vertical fins at each upper wing tip, hinged at the base, are lever connected to the ailerons. Pressure on the vertical surfaces from a side slip or skid actuate the ailerons to correct the side slipping or skidding attitude. It is a nice problem to secure properly proportioned parts, and over or under control is the tendency. Possibilities as an auxiliary to manual control are present, but it would appear that the same result could be secured by balances directly connected to the control surfaces.

## Servo Motors

Servo motors, similar to the power steering mechanism on steamships, are used on the larger airplanes to assist the pilot in moving the control surfaces. Commonly these comprise a series of clutches, or friction disks, driven by a wind motor, shifted through the action of the control cable to act in conjunction with the control column or wheel. The movement of the surfaces is at all times in the hands of the pilot as far as amplitude and speed of motion are concerned, the servo motor doing the actual work of displacement.

The servo motor principle is excellent, and merits further development. Those servo devices available to date are open to criticism of mechanical design, reliability, service life, and adaptability to ready incorporation in the design.

## Gyroscope Control

Airplane control through gyroscopes and electric motors has been tried out with some success. On straight away flying, a control of this type relieves the pilot of all duty except supervision. However, on landing, the gyroscope control is thrown out, as its sole function is to keep the plane in balanced horizontal flight and to resist any change in altitude whether desired or not.

The gyroscope control is of necessity complicated, comparatively heavy, and subject to failures. It can, and doubtless will be developed and refined, as it meets the requirements of large planes on long flights.

The most common method of securing ease of control is to balance the control surfaces themselves, so that little effort is required to displace them. Several types of counter balance are in use. One is a double cambered extension of the control surface tip, reaching forward of the hinges. Another, the auxiliary balance type, comprises a small surface held away from and forward of the control surface proper, and rigidly connected to it. Both types are in common use, and if properly designed, simple, effective and efficient.

To sum up, no one invention, device or design is going to meet all operating conditions. On small planes—up to 70 ft. span—a reasonable amount of stability and an intelligent proportioning of the control surfaces will provide satisfactory air qualities. Balanced control surfaces here are a refinement rather than a necessity, as the effort required to move the surfaces is relatively small. On the larger planes, balanced control surfaces are essential. Inter-connection of the aileron leads is advisable, so that the loads carried by the pilot's controls are only those of displacement.

Aerodynamic controls that remove all connection between the pilot and the control surfaces are hazardous. Servo motors are an aid and merit further development. The gyroscopic control will prove advantageous in large air cruisers to come. The problem of flying controls cannot be solved once and for all for all planes, but refinement of original designs based on common laws, together with attendant development of control accessories, will render flying more certain and less hazardous.

The greater the development along these lines, the more rapid is the commercial growth of flying likely to be. Such development already has been going forward to a considerable extent.

# A New Machine for Use in Sinking Large Dies

Is especially adapted for machining the surface of dies used in the manufacture of pressed body panels, cowls, fenders and the like, the tool being guided by a "master" which may be of soft material.

**I**N the manufacture of modern sheet metal automobile bodies use is made of very large dies for forming the panels, doors, cowls, fenders, etc. These dies, which are made of cast iron or steel, involve a very heavy expense and, besides, the time in which they can be produced by the methods which have been in use is long and rather uncertain. The surfaces of a body must be without perceptible inaccuracies, and if a slight mistake is made in the die sinking operation it is often necessary to rework the entire surface of the die. In making these dies it has been necessary to take them from one machine to another, and great demands are made on the skill of the operator. After the machine operations are finished the fitting still involves lengthy and laborious hand operations.

A special machine for cutting or sinking dies for large parts of the character mentioned has been developed by the Keller Mechanical Engraving Co. This firm has been making die sinking machines for a good many years, but until recently there was little possibility of applying these machines to the production of such dies as are used in the manufacture of metal bodies, due to the fact that the operation of their machines depended on a principle which made the pressure of the tracer passing over the "master" or model equal to the pressure of the cutting tool on the block. This made the use of masters or models of soft material impossible. The models for body parts are usually made of wood, and as these could not be used directly in the die sinking machine, a number of rather expensive intermediary processes would have been necessary, thus rendering the process impractical.

This difficulty has been overcome in the new machine by the use of electric control. In this machine the pressure of the tracer on the model is entirely independent of the pressure of the tool on the work. The machine operates on the milling principle, the tools used being combination face and end mills. The master and the work are clamped to the stationary table of the machine, the former above the latter; a tracer controlling a number of electric contacts passes either horizontally or vertically over the model. Both the tracer and the cutter are capable of motion in three planes at right angles to each other; in other words, they have feeds in three directions. When the travel or stroke of the cutter in its work is normally in a horizontal line, parallel to one of the main planes of the master or work, the regular feed of the cutter head, after each cut or stroke, is in a vertical direction, and vice versa. Finally, there is what may be called the "in and out" motion, which, compounded with the stroke or travel of the tool head, gives to the cutter a motion corresponding to the line formed by a section of the master surface at the level of the tracer. Feed and travel controls are interconnected and each of the two may be made either vertical or horizontal. All of these motions are on heavy

slides and are effected by means of lead screws driven by electric motors. The feed is automatic in both the vertical and the horizontal plane. Quick return motions are provided for both the transverse and "in and out" directions.

There are several electric motors which are mounted directly on the machine with practically all wiring fully inclosed. Of these the cutter drive motor is of 2 hp. and the feed motor of  $\frac{3}{4}$  hp. The circuits of the motors are controlled by a series of push-button switches arranged on a switchboard in a location convenient for the operator.

In the manufacture of such sheet metal parts as here referred to it is, of course, necessary to have both a punch and a die or a male and a female die. If the punch is produced directly from the model the die can be made from a plaster or cement cast taken from the model, or, better still, this cast can be made from the punch after it is finished. Allowance for the thickness of metal to be formed can even be made in the die by covering the model with a layer of sheet wax of the required thickness.

The machine here illustrated can cover die surfaces up to 72 x 48 in., and even this is not its limit, as in the case of larger die surface, after part of the die has been completed the whole machine can be moved transversely on its bed and the rest of the surface finished.

The worktable of the machine is stationary and is provided with T slots for mounting the master and the work. The transverse feed of the spindle head can be varied from 2 to 12 in. per minute by means of rheostatic motor control and change gearing. The vertical travel is at the rate of 6 in. per minute. The feed per stroke can be made anything from 0.030 to 0.250 in. The spindle can be driven at from 60 to 420 r.p.m. and is arranged to take a taper shank (No. 12 B. & S.) capable of carrying end mills up to 5 in. diameter.

The spindle head is carried on a sliding column and is counterbalanced. This, as well as other moving parts, has a large bearing surface and is provided with taper gibs. The spindle is driven from a separate electric motor through back gearing. Lubrication of the spindle is from two sight-feed oilers which communicate with all bearing surfaces. The cutter is lubricated by means of a gear-driven rotary pump, the surplus oil draining back to a tank in the bed.

It is always advisable to use the coarsest feed consistent with the nature of the job. The raised feed lines are easily ground off and a correct, smooth surface is obtained in a short time.

The illustrations herewith show the machine working on the die and punch for an automobile cowl. In this operation a 2-in. mill is used for the roughing cut and most of the finish cut, and a  $\frac{3}{4}$ -in. mill for sections too small for the 2-in. mill. Each piece is completed in 24

Upper left—Keller automatic die-sinking machine at work on a cowl. Upper right—Front view of machine, showing starter box for main spindle motor, method of carrying cables in flexible metal conduit and balancing of cutter head. Lower left—View showing master in cement (above) and die blank of cast iron being worked on (below). The tracer and milling tool can be clearly seen. Lower right—Master and blank for punch for cowl

hours. We are informed that in many places more than  $\frac{1}{2}$  in. of stock was removed.

The first machine of this type was installed in the plant of Edward G. Budd & Co., body builders. Machines have also been furnished to the Studebaker and Dodge plants and one for the Ford plant is in the process

of manufacture. The machine should not only greatly cheapen but also expedite the production of dies for body parts.

The machine is equally applicable to large forging dies. Obviously it has advantages for dies for crankshafts, camshafts, axles, etc.

# Developing a Ground Organization for Civil Aviation

## Part I

No reliable commercial air service can be maintained without suitable landing grounds at regular intervals. France has developed an excellent ground organization. Mr. Bradley presents here an analytical description of French developments and relates them directly to American problems. An important contribution to civil aviation development.

By W. F. Bradley

**S**INCE the day when the Wright brothers made their first soaring flight in South Carolina, the impression has spread and grown that aerial navigation, unlike any other form of travel, was free from all the trammels of route and road, of port and harbor. Even leaders in the aeronautical movement have been guilty of the error and have been responsible for the organization of trials and competitions intended to improve the speed, the reliability and the endurance of machines at a time when their efforts ought to have been directed towards the creation of conditions under which planes could operate with the highest degree of safety.

The greatest obstacle at the present time to the development of commercial aviation is the absence of aerial roads—the lack of the entire ground organization corresponding to the docks, harbors and explored waters of maritime navigation, or the permanent ways, signals, stations; and sidings of our railways.

There was a time not many years ago in the history of the American nation when it was more important to make roads than to develop automobiles. The nation realized that and gave its support to the good roads movements with such enthusiasm that the industry has been able to attain its present prodigious importance.

Commercial aviation at the present time needs land organization, the creation of chains of landing grounds, weather report stations, gasoline depots, repair shops, etc., without which real development is impossible.

Until such a service has been established all over the country there can be no healthy development of commercial

aviation. This duty devolves on the national Government and not on private enterprise or local authorities. It is not only unreasonable to expect aerial navigation companies to create ground organizations, but such a plan would be as detrimental to the general interests of the nation as the old system of toll roads. This fundamental fact has been realized by the French aviation authorities, and as a consequence the Government has set itself the task of laying out aerial roads which must be free for all—in distinction to aerial lines which would remain the property of certain vested interests.

The importance of France in connection with this program lies in the fact that her territory constitutes the cross roads of Europe. This special geographical and commercial situation of France has been fully appreciated by the Government and has largely influenced them in their plans for developing commercial aviation within their frontiers.

### Opening Aerial Lines

Whenever there is interest in opening up two points by aerial communication, the French Service de la Navigation Aérienne undertakes the whole of the ground service, leaving the actual operation of the planes in the hands of aerial navigation companies. In other words, the Government builds the aerial roads, and private companies or individuals use them.

No reliable and regular commercial air service can be maintained unless the entire line of flight is marked out by landing grounds at intervals of sixty miles. In coun-

Arrival of Farman twin motor plane at Bourget, near Paris, coming from London

Belgian and French planes used on international service

Farman twin engine Goliath used on Paris-London service

tries where much fog prevails, such as northern France and practically the whole of England, this distance must be decreased to thirty miles. The foundation of commercial aviation is economy of time and safety. This implies regularity, for so long as there is a doubt regarding the possibility of a plane reaching its destination there can be no real economy of time. The attempt has been made in Europe and elsewhere to run regular services without a string of landing grounds, with the result that planes would frequently start out on time, get within a few miles of their destination and then by reason of fog or other weather conditions be obliged to swing round and return to their starting ground. Had intermediate grounds been available, the planes could have landed there and either have waited for an improvement in weather conditions or have transferred the passengers to automobile or train.

While these landing grounds must be frequent, they need not necessarily be elaborate. In very many cases the pilot does not even need protection against the weather, for his machine is capable of being parked out in the open. He must be assured, however, of a prepared ground on which he can land with safety, of a supply of gasoline, a telephone, and weather reports.

#### Types of Landing Fields

Under the scheme worked out in France, and which is being gradually applied to the whole of that country and will be extended to other European countries, five different types of landing grounds are provided for. They begin with a very simple form of emergency landing ground, in charge of a guardian—usually a man and his wife, who live in a cottage on the field—a supply of gasoline, a selection of tools, a telephone to the nearest town, and weather bureau reports. These emergency landing grounds should measure about 500 by 500 yards, or have an area of ten acres, and while being on the direct line of flight, they should, if possible, be by the side of a main road, so as to assure ease of access and if possible be near a town or village.

Although the French Government idea is that all landing grounds from the simplest to the largest, intended to be used by passenger or freight carrying planes, should be owned and controlled by the State, experience in other quarters has shown that economy can be effected and very good results obtained by renting land for emergency landings. This is particularly applicable when traffic is light. An emergency landing ground may not be required more than once a year, but when it is needed it is needed urgently. It is therefore possible to get an option on land which can remain under cultivation, but which at the same time will always be kept in such a condition that planes can land on it with perfect safety.

Ignoring the emergency ground, four types of aerial stations are provided under the European scheme. These begin with a third class station, followed by a second class,

a first class station, and most important of all, an aerial port. The plan of the French Aerial Navigation Service provides for correlation between each of these, so that as traffic increases, or the necessity makes itself felt, each type of landing ground can be developed into a higher class without any buildings having to be torn down or any rearrangement of the general plan.

The area of the ground must not be less than fourteen acres, this being on the supposition that the approaches are clear, without tall trees, high buildings, or high tension electric wires. Although long-distance planes will not usually make landings at these intermediate stations, the grounds should be laid out so as to give adequate protection to planes obliged to make a landing, and also have the necessary facilities to be used as regular stopping places. Even the third rate station should have one permanent shed not less than 110 by 100 ft., a workshop fitted up for metal and wood working, forge, stores, and automobile garage. There should be two trucks on the ground, one of 1½ and the other of 3-ton capacity.

In addition to the caretaker, who will live on the ground, there should be a ground manager, preferably an aviator; a weather bureau should be established, and a wireless telegraphy station installed. In laying out a third-class station additional ground should be secured to enable more sheds to be erected, as required. The single shed is intended for planes which have to make a forced landing, or for the planes running on a regular schedule, but only making short stops on the ground.

#### Second-Class and First-Class Stations

The second-class station, under the French scheme, is an enlargement of the third-class post, with more sheds, better mechanical facilities and a bigger supply of gasoline, oil and spares. A first-class station, while on the same general lines as the smaller ones, calls for an elaborate equipment. It should have at least two permanent sheds, a long-distance wireless installation, well-equipped machine shop, gasoline, oil and spare parts, central offices, customs office if near the frontier, a station master's office, a complete weather bureau, and as many private sheds as are required for local flights. The aerial port is the most important of all, for it is generally the terminus of international lines and the scene of much local flying.

At the present time there is only one aerial route in the world laid out approximately on the lines indicated above. This is the line from Paris to London. No pilot can fly in Europe unless he possesses a Government license and unless his physical condition is found satisfactory at half yearly medical examinations. For this service there is a special medical department at Le Bourget with the necessary instruments for testing eyes, heart, nerves, pulse, etc. Weather reports are prepared by the French Government Meteorological Department and are received and despatched from all stations along the route seven times a day.

Few figures exist on the cost of construction and operation of aerial routes, for few such routes exist. The only really reliable data in existence is that in connection with the Paris-London route, where, on the basis of a big terminus at each end of the line, and landing grounds at intervals of thirty miles over the entire route, the cost of construction is 20,000 francs per kilometer, or at nominal rate of exchange, \$2,300 per mile. In arriving at this figure the whole of the cost of the Bourget air port is included, whereas it would be reasonable to only charge one-third to this line, for this port is also the terminus of the Brussels and Warsaw lines.

Building an aerial route is very much cheaper than building a highway, for using the French figures as a comparison, a twenty-three-foot first-class highway costs 200,000 francs per kilometer (\$23,000 per mile) to build, and has to be remade every ten years. The maintenance of an aerial route of this nature is 2,000 francs per kilometer (\$230 per mile) per annum. Unlike a highway or a railroad, the cost of the aerial way does not increase in proportion to the increase in traffic, for there is no limit to the width of the road, and overhead charges decrease enormously as traffic volume increases.

It is the practice of the French Government department to purchase land outright when building an aerial route. This is more costly than would be the case in the United States, for land is considerably divided, and in order to get suitable ground a vast number of holders have to be dealt with. It generally happens that one or more in the group refuses to accept the Government offer, and before the obstreperous individual can be made to yield legal proceedings have to be undertaken, with consequent delay and expense.

#### Government Revenue from Aerial Traffic

An important income may be expected from an aerial route carrying intensive traffic. This will principally be obtained from port dues paid by the companies running regular home and foreign services, and by casual tourists. In France the fee for landing on a State ground is one cent per horsepower, with an additional fee of 20 cents if the machine is fitted with wireless. The pilot is entitled to assistance from the ground hands in bringing in his plane, starting the motor, bringing water, oil, and gasoline, etc. For starting or landing at night an additional fee of \$4 is charged for lighting the ground.

For the use of a shed the price varies according to whether the machine is a casual tourist or a regular liner. For the former the use of a shed for twenty-four hours costs 2 cents per square meter, this area being obtained by multiplying the wing spread by the length of the machine. For touring or privately-owned planes sheds can be rented for periods of three months at a cost of slightly less than 1 cent per day per square meter of surface, this including light and caretakers. Special arrangements are made for regular liners, the owners of which require sheds only and maintain their own staff.

On the important landing grounds repairs can be carried out by the ground staff, the rates being 70 cents an hour (nominal exchange) for skilled labor and 50 cents an hour for unskilled labor. Material is charged at cost price and the total amount increased 25 per cent for overhead. For the use of a tractor the charge is 35 cents a kilometer, and for a five-ton truck 70 cents a kilometer. For a passenger car the charge varies from 20 to 30 cents a kilometer, according to the size of the automobile.

An adequate weather report service must be organized in conjunction with every established aerial route. Under the system of State owned landing grounds, as it exists in France, the Government Weather Bureau organization is made use of and reports sent to every station along the

line of flight. On the Paris-London line, for instance, which is subject to much fog, it is most important that the pilot should know, before starting out, what kind of weather he will find over the sea, and whether landing conditions will be suitable at the end of the trip. It is quite possible to make a start under bad weather conditions if the pilot has the information that he will run into clear atmosphere within a few minutes, or if he is sure that he can pick up his bearings on the coast and that his terminus point is not hidden in fog.

There is no complete wireless telegraphy service in operation on any aerial line. On the Paris-London route wireless ground installations exist, and weather reports are received by these, but wireless between ground and plane has not yet been completed. This problem is receiving close attention, and it is expected that before the end of the present year all the regular passenger-carrying planes on the Paris-London route will have wireless, enabling them to keep in touch with their terminus point during the 2½ hours they are in flight. It is recognized that a good wireless system is essential to any properly organized line.

#### Night Landings

Night flying still remains one of the problems of the future, for such trips can only be carried out with safety on a perfectly organized aerial route, with landing grounds every thirty miles, every one of which is fitted not only with a light house, but with an installation for flood lighting. Flood lighting sets, such as were used during the war, are now in service at the big aerial stations, but there is no chain of lights across country necessary to guide the pilot to his destination. At the present time such installations as exist are in the nature of a makeshift to assist pilots who for any reason whatsoever are out after sunset. Eventually it is intended to light the entire Paris-London route, but for the present flash lights exist only at the Bourget and Croydon termini and the frontier station at St. Inglevert, and have a visibility of twenty-five miles. Merely to show the pilot his route suitable lights on the railroad stations would be sufficient, but if the service is going to be carried out with the same degree of safety as during the day it is essential that every emergency landing ground should be equipped for flood lighting, and that this should be ready to be switched on whenever a pilot signalled from the air that he was under the necessity of coming down. At the present time no such organization exists.

War experience has shown that night landings can be made with a high degree of safety by the use of fuses dropped with a parachute, but the cost of these is so high that no planes carry them even for emergency purposes. Electric generating sets on the plane have not given any great amount of satisfaction, for if employed without batteries they give the least light when it is most needed, and the use of batteries constitutes an extra load from which very little extra service is obtained. For signalling purposes an isolated light is of much more value than a more powerful light in the center of a city. As an instance, the flash light on the top of the Eiffel Tower, nearly 1000 feet above the ground, is not so readily picked up as less powerful lights placed on aerodromes well outside the city.

#### License Methods

No plane can be flown in France unless it has received a navigability certificate after having been technically examined and approved, and unless it is officially registered and carries its registration numbers and letters on the wings and fuselage, as provided by law. No pilot can fly unless he has his official license and has passed a medical

examination. For public services, carrying passengers and freight, the control is really severe and corresponds, in a general way for both machines and crew, to that in force for ocean-going vessels.

In establishing the French airplane license, the procedure adopted is similar to that for automobiles. All new types have to be examined by a Government technical department before they can be put into service, but all subsequent machines of the same type are given a navigability card on proof being shown that they conform in every respect to the original model. The registration certificate certifies the nationality of the machine, whether it is privately owned or in public service, the name and address of its owner, and the identification marks it must carry.

Only war planes can carry the military marking consisting of red, white and blue circles. Commercial machines are in two classes: those used in public service for passengers and freight, and those used privately by their owners. The first one of the series of letters painted on the wings and fuselage indicates the nationality. These letters have been determined by international agreement, and are, among others, F for France, G for Great Britain, O for Belgium, etc. A heavy black line under the identification marks shows that a plane is on private service. A registration card corresponding to the numbers carried must be aboard at all times. These regulations do not apply to experimental machines, which, however, must be kept within a radius of three miles of their factory or flying ground.

In addition to its registration certificate, every plane must carry a navigability license, which really corresponds to a ship log book, and if on public service this must be filled up with particulars of every trip made and an account of all repairs and work done on the plane and the engine, thus giving the aviation authorities a complete history of every plane used for passenger service.

Every pilot on a public service plane must possess a license, which is only issued after a practical examination, and a log book containing a record of his medical examination, all flights undertaken, accidents, etc. The license is only given for a period of six months, at the end of which time the pilot must undergo another medical examination. The pilot's log book is also renewable every six months, and unless the holder has accomplished a minimum of ten hours' flying in this period he must undergo another practical examination.

#### Commercial Status

There is not a single aviation service in Europe at the present time which is on a paying basis from its commercial receipts, and it is only by reason of State subsidies that European lines are being kept in operation. It is by means of this subsidy system that the Government is able to keep a close control on the aerial navigation companies and to insist on the regularity of operation and the adoption of precautionary measures which will reduce accidents to the lowest possible figure, and so gain the confidence of the public.

The slogan of the Aerial Navigation Service is "Safety First," and anything which savors of stunt flying or recklessness is rigorously suppressed. Stunt flying is looked upon with a particularly evil eye.

It is the duty of the State to insist on the highest degree of safety in planes and engines, and here again the subsidy system is of value, for it enables the Government to maintain a more rigorous control than would be possible in any other way. Every plane must carry three log books, which must remain aboard, must be filled up every day, and which must be shown to the aviation authorities whenever requested. These books are the route log, the

View of weather report boards at Le Bourget aerial point

plane log and the engine log. The route log contains a record of every trip made, with indication of the number of passengers or load carried, the length of ground test of the engines before starting, maximum number of revolutions of the engines on the ground and in the air, quantity of gasoline and oil carried, any incidents which happen en route, observations of the pilot, wireless messages received or transmitted, the route followed, direction and force of the wind, drift, speed, altitude, and general atmospheric conditions.

#### Standards of Safety

The plane log contains, in addition to a complete description of the airplane, a record of the initial tests before going into service with horizontal speed at various altitudes, climbing ability, horsepower, loading, etc. This log also contains the make and numbers of engines and propellers, the date fitted and dismounted, and the number of hours of flight. The records required regarding the plane are date of each trip, number of crew carried, name of pilot, hour of starting and arrival, duration and length of flight in miles, number of passengers carried, weight of freight or mail, and quantity of fuel carried. A detailed account has also to be maintained of all repairs or modifications to the plane and the number of hours' flight between each. For the engine log practically the same information is required, so that with the three books a complete history is available at all times of the life of the plane and its engine or engines.

In the present state of aviation development it is difficult to establish absolutely rigid standards of security, for while on the one hand it is desired to protect the public in the greatest possible measure, on the other hand some room for initiative must be left with manufacturers.

For a public service machine it is stipulated that a plane should be capable of rising with its full load, and without the aid of a head wind, within a length of 330 yards, and land with its engines stopped in a length of 270 ft. Its climbing ability should be 9840 ft. in a maximum of forty-five minutes. Every multi-engine plane must be capable of maintaining horizontal flight at an altitude of 6500 ft. during one hour with a single engine if it has two or three, and with two engines if it is fitted with four. For every plane intended for trips of more than four hours' duration double control must be provided.

One of the French regulations is to the effect that planes making trips of more than four hours' duration or carrying more than four passengers must be fitted with a wireless transmitting and receiving set, carrying at least 180 miles. There is a certain amount of laxity on this point, however, owing to the technical difficulties con-

nected with the installation of wireless on planes. There is the fact, too, that few public service planes make single trips of more than four hours' duration.

No restrictions are placed on the design or construction of airplane motors and the regulations, in general, are merely of a nature to prevent accidental stoppage or break down. There is a stipulation that for public service planes having a load of 2½ tons or more (useful load plus weight of fuel) at least two engines shall be fitted, it being understood that each engine shall be capable of maintaining the machine in the air, as previously mentioned in this article.

An engine revolution counter must be fitted with a red mark on the dial showing the limit number of turns, the pilot and mechanics being forbidden to exceed this figure. Every public service plane must be fitted with double ignition and double distributor and have an ignition cut out for each engine and a separate one operating on the two together. There must be a gasoline shut-off cock for each tank, placed in such a position that it can be operated by the mechanic. A thermometer is stipulated for each engine, so mounted that it will show the temperature of the water at the outlet from the cylinders.

Precautions against fire are a space of at least three-quarters of an inch between the exhaust pipes and all parts of the plane, with the end of the pipe in such a position that it is impossible for the exhaust gases to come in contact with any combustible part of the plane. Carbureter air intake pipes must be brought entirely outside of the fuselage and be fitted with wire gauze screens as a precaution against fire. Provision has to be made for the proper escape of all gasoline overflowing from the carbureter, in whatever position the plane may be flying.

Under the French subsidy scheme every engine must be taken completely out of the plane and entirely overhauled after a maximum of 100 hours' flight. Every plane must

be stripped, examined and re-erected after a maximum of 200 hours' flight. In reality these limits of service are rarely attained. Taking as an example the Farman twin-engine Goliaths used on the Paris-London and Paris-Brussels service, the rule adopted by this firm is that every engine shall be lifted out of the fuselage after a maximum of sixty hours' flight. The engines are then completely pulled down, examined, repaired, re-erected, tested, and put into service again. Although this is the general rule regarding the length of time an engine shall be allowed to remain in service, it is very rarely that an engine remains untouched for this length of time.

The companies running regular airplane services are unanimous in stating that it is impossible, at the present stage of aerial development, to adopt any hard and fast rules for the examination and dismounting of engines. The most reliable companies have preferred the sixty-hour to the official 100-hour limit of the French authorities, but they never assume that because an engine has only done ten hours' flight it is therefore in good condition. With close examination after each trip and a sufficient number of reserve planes regular service can be assured, but the life of an engine is such a variable factor that it is difficult to establish really reliable operating costs.

Main European Airplane Lines in Regular Service

Route	Service	Distance, Miles	Time, Hr.	Cost, Pass.	Cost Freight
Paris-London	Daily	233	2½	300	5 f. to 7.50 kilo
Paris-Brussels	Daily	186	2	175	3 to 4 f. kilo
Paris-Amsterdam	Daily	250	3	300	5 to 6.50 kilo
Brussels-London	Daily	186	2	225	5 to 7.50 kilo
Amsterdam-London	Daily	264	3	400	
Paris-Strasbourg	Daily	248	2½	150	2.50 f. kilo
Paris-Prague	Daily	560	6	500	7 f. kilo
Paris-Warsaw	Daily	870	9	800	
Toulouse-Barcelona	Tri-weekly		2½	468	
Toulouse-Alicante	Tri-weekly		6	924	
Toulouse-Malaga	Tri-weekly		9½	1,068	
Toulouse-Rabat	Tri-weekly		12	1,560	
Toulouse-Casablanca	Tri-weekly	1,150	13	1,680	18 f. kilo

Mall is carried on all these lines.

## Time - Temperature - Humidity Control for Kilns

AN apparatus for controlling the temperature and humidity of the air passing through dry kilns as used in connection with automobile body-building establishments and aircraft plants has been perfected by the C. J. Tagliabue Mfg. Co. It is based on the principle of the wet and dry bulb. Two thermostatic bulbs are employed, containing a fluid very sensitive to temperature changes. The dry bulb affords the means of keeping the air temperature inside the kiln within the desired limits and is simply influenced by the temperature of the air. The wet bulb is influenced by the rate of evaporation of the water fed to it by a wick.

The drier the air is the more rapid does the evaporation proceed, and a greater amount of heat is therefore ab-

stracted from the wet bulb. This reduces the temperature of the wet bulb in comparison with the temperature of the dry bulb. The opposite, of course, also holds true. It is therefore evident that the temperature of the wet bulb indicates the humidity of the air, and the humidity can be controlled in any desired way by so varying the water supply as to maintain corresponding wet bulb temperatures. The Tag Controller automatically maintains the required air temperature by regulating the heating coils and maintains the desired humidity by regulating the steam sprays. The setting point of the controller is automatically shifted to take care of any desired air temperature and any desired humidity during the desired time period, by means of a cam revolving by clock work.

Diagram of Tag Time-Temperature-Humidity control system

TO protect aluminum and its alloys from corrosion by browning the metal electrolytically, the aluminum is suspended in an electrolyte consisting of a sulphur compound of molybdenum with a zinc anode at a temperature of 60 deg. to 65 deg. Cent. The aluminum is soon covered with a dark brown coating, and may be bent or rolled without cracking the coating. Aluminum thus treated was immersed in a salt solution for two months without showing the slightest corrosion.

# A Practical Analysis of British India as a Market for American Motor Vehicles

## Part II

Much detailed information is here given regarding trade conditions met in various sections of India and the routes which trade naturally follows from coast to interior, with particulars regarding primary and secondary distributing points and the territory served from these points.

By Charles Sumner Turner

**A** MAJORITY of the leading motor trading firms in British India were evolved within or from old established merchant firms whose business activities included sales agencies for engineering supplies. Under this category were included motor car agencies, and in time these were assigned to a special department of the business or to separate companies. Ample facilities of finance, personnel and establishment, in combination with choice of best available British and Continental car agencies, assured pre-eminence in the trade to the firms so evolved. In the last year before the war, when American cars in India were a negligible quantity, the establishments of the leading motor trading firms in Calcutta, Bombay and Madras were impressive. Outside of these cities motor trade was negligible. Some of these companies possessed exceptional facilities of plant for service and body building, essential to a proper treatment of high-class European motor car trade at that time.

During the war period the only motor car source of supply was America. Most important American car agencies were attracted to the few pre-eminent firms, and several firms of minor importance to the motor trade of pre-war days attained much success and extension of their organizations through their control of important American agencies. In the post-war years many new motor trade enterprises were instituted, but the future of some of these is problematical at this time.

In the two years of 1919-20 British India imported from various car exporting countries approximately 26,000 passenger cars; the greatest quantity in any prior two-year period having been 8000 cars in the years 1916-17, against which 3000 to 4000 cars was a fair average of imports over a two-year period before the war. This shows a most interesting and extraordinary development.

From the viewpoint of an American motor car sales executive, it is apparent that selling organizations in India, with two or three conspicuous exceptions, have not attained physical and financial development commensurate

with the amount of business undertaken in the past two years. It is not far outside the facts to estimate the large quantity of cars imported into India in 1920 being little more than half the quantity originally ordered.

Under normal conditions any trade development in India is a slow progress. It has been plainly seen that the extraordinary business undertaken in a short period was considerably in excess of what could be readily assimilated through the facilities of trade present or immediately in prospect.

---

**I**N July, 1919, the British Trade Commissioner in India and Ceylon made the following comment:

"The advent of the motor car has revolutionized life in India, and together with the common use of the electric fans, has enormously added to the comfort of Europeans, especially in remote interior districts. The car is popular with Europeans and natives alike and there is little doubt that the demand from India will reach an intensity in the future which would not have been credited in pre-war days."

---

Capable management of an important motor trading firm in India requires superior ability and considerable capital. It is a serious matter to obtain the necessary capital to pay factories for cars five to six months prior to the arrival of the cars in the territory. When firms must borrow capital or use the capital facilities of shipping, or other firms, a factor is introduced which may be helpful or not, according to the disposition toward the motor trade of those controlling these facilities. English capital facilities

are quickly assigned to new trade channels and purposes essential to British trade and industry, and such capital was a conspicuous factor in our large motor trade of recent years with India, during which time America was, until the very recent past, the only source of motor car supply for that market. American motor car and other trades do not now present the attraction they did to British trading capital during the war and post-war periods. British capital in India is primarily a trade facility, and in view of the preponderant British trade of that market, capital has many opportunities for use, is generally assigned to the most secure and convenient channel. The necessity for the application of American credit facilities to this trade in a greater degree than in the past is obvious.

Other factors such as personnel, diverse conditions of peoples, politics and trade peculiar to different places and territories throughout India define the logical sphere of influence of many firms.

American car manufacturers whose export trade is de-

pendable or who plan to gain a share of this trade, have much to do, as regards the Indian market in particular, in the way of interpreting to dealer trade requisite methods for quantity distribution of American automotive products, since such methods are unlike British and Continental methods.

For America to secure the largest share of the Indian motor trade our manufacturers must accord the market the same intimate treatment accorded to our business with the United Kingdom, which foreign market alone exceeded the importance to us of India in 1920.

An excess of agencies, in all classes of trade, is a characteristic of most important firms in India, including those in the motor car field. The condition manifests the apparent path of least resistance to sales effort, and we had the same here in America at a comparable stage of our motor trade evolution. Below are shown agencies exercised by several important firms, according to announcements that have come to the writer's notice.

Firm at Calcutta and Bombay	Firm at Calcutta, Bombay and Allahabad	Firm at Bombay
Panhard & Levasor, Berliet, Minerva, Mors, Bianchi, Angus Sanderson, Bean, Vauxhall, Cadillac, Studebaker, Dodge.	Sizaire-Berwick, Austin, Briton, Talbot, Cubitt, Calthorpe, Guy "8," Castle "3," Royal Enfield Cycles, Bat Cycles, Austin Trucks, Halford Trucks, Velie, Briscoe, Harley Davidson Cycles.	Fiat, Sunbeam, Angus Sanderson, Vulcan, Morris Cowley, Morris Oxford, Wolseley, Austin, Leyland Trucks, Thornycroft Trucks, Vulcan Trucks, Willys-Overland, Willys-Knight, King, Garford Trucks.
Firm at Colombo	Firm at Madras	Firm at Calcutta
Auto Carriers, Austin, Swift, Sunbeam, Rover, G. W. K. Humber, Berliet, Willys-Overland, Garford Trucks, Harley Davidson Cycles.	Daimler, Vauxhall, Sunbeam, Wolseley, Angus Sanderson, Studebaker, Chevrolet, Federal Trucks.	Daimler, Standard, Talbot-Darracq, Commercial Trucks, Mathias, A. U. B. Willys-Overland, Oakland, Garford Trucks, Hupmobile.

One solution appears in demonstrating to some dealer controlling an important American agency the desirability of restricting his sales efforts to a minimum number of makes. Another is to encourage and assist the development of new firms and influence their activities.

Before the war the urban trade of Calcutta, Bombay, Madras, Rangoon and Colombo was practically the only important motor car trade in India. Now conditions are greatly changed.

The accompanying map shows where throughout India there are motor trading firms at the present time. The lines indicate logical relationship of major and minor places. This presentation is fairly comprehensive of places where motor car business is being done, and undoubtedly the near future will find this trade appreciably extended to other points not shown on the map.

#### Principal Ports of Entry

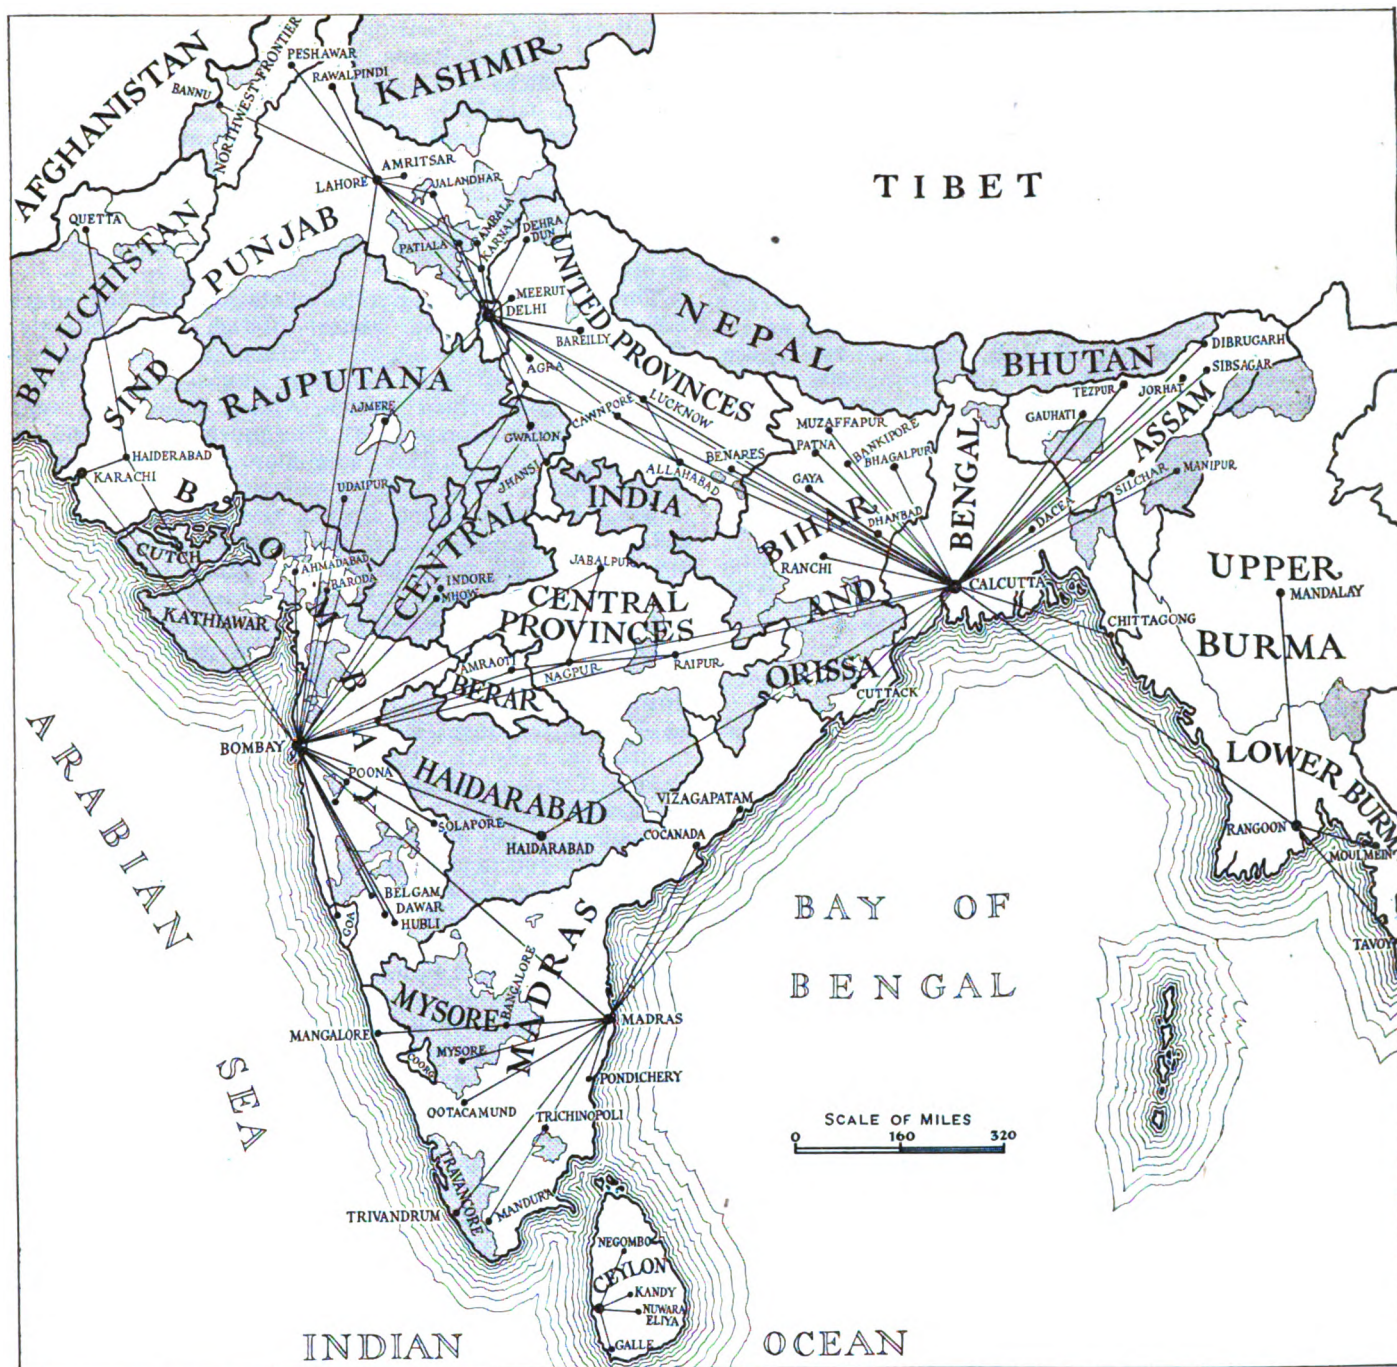

The principal points for car imports into India are Calcutta, Bombay, Madras, Karachi, Rangoon and Colombo, Ceylon, at which points the largest motor trading firms are established. The motor trade development of the interior is progressing rapidly, and such places as Delhi, Lahore, Cawnpore, Lucknow, Nagpur and Hyderabad (Deccan) are to a considerable degree removed

from their former trade dependence on the chief coast ports.

The following outline of principal distributor and sub-agency points and relative territory presents an intelligent basis for allocating agencies throughout India and Ceylon at this time:

Principal Distributing Point	Sub-Agency Point	Territory	
		Minor	Major
Calcutta	Dacca, Chittagong, Gauhati, Tezpur, Sibsagar, Jorhat (sub-div. of Sibsagar), Silchar, Manipur, Dhanbad, Ranchi, Gaya, Bhagalpur, Muzaffarpur, Cuttack, Patna, or Bankipore,	Kamrup, Darrang,  Cachar, Manipur State, Manbhum, Bihar and Orissa Province	Bengal Province Assam Province
Delhi	Allahabad, Cawnpore, Lucknow, Benares, Agra, Aligarh, Meerut, Dehra Dun, Jhansi, Bareilly, Gwalior,	Patna,      Bohilkhand Div. Gwalior State, Central India	Delhi District United Provinces Provinces
Lahore	Ambala, Karnal, Amritsar, Jullundar, Rawalpindi, Patiala, Peshawar, Bannu,	    Patiala State, Northwest Frontier Province	Punjab Province
Bombay	Ahmadabad, Poona, Belgaum, Sholapur, Dharwar, Hubli (town in Dharwar), Mahdbaleshwar, Baroda, Indore,  Mhow, Udaipur, Ajmer, Nagpur, Jubbulpore, Raipur, Amraoti, Hyderabad, and/or Secunderabad	Baroda State, Indore State, Indore State, Mewar State, Rajputana, Merwara State, Central Provinces Berar Province	Bombay Presidency Central India Provinces
Karachi	Hyderabad, Quetta,	Sind	Hyderabad State Bombay Presidency Baluchistan
Madras	Vizagapatam, Cocanada, Trichinopoli, Madura, Ootacamund, Mangalore, Bangalore, Mysore, Trivandrum, Quillon (Kollam),	Godaveri,   Nilgris, South Canara, Mysore State, Mysore State, Travancore State,	Madras Presidency

Map of India showing ports of entry, trade centers and territory served from each. The shaded areas are the native states

Rangoon	Burma
Mandalay,	
Moulmein,	
Tavoy,	
Colombo	Ceylon
Kandy,	
Nuwara Eliya,	
Galle,	
Negombo,	

The sub-agency points shown are located within administrative divisions or districts of same name as the town, where not otherwise indicated. Such districts, owing to the present stage of motor trade development, would not, in many cases, exactly define the sphere of trade influence of the places shown.

With regard to British India proper (which excludes Ceylon), in former days the motor trade at interior points of middle and northern India was handled almost entirely through or by firms at Calcutta and Bombay, and

some of the important firms of these two cities now have establishments at interior points.

Whatever method a car manufacturer might adopt for the purpose of advancing his business in India, his objective should be a minimum of distributor dealers at the eight principal points shown, and territory, therefore, assigned generally as indicated. In view of the increasing trade importance of interior territories and the firms therein, it is possible to effect principal arrangements at Cawnpore, Lucknow, Allahabad, Nagpur and Hyderabad (Hyderabad State). The motor trade of Central India, Central Provinces and Hyderabad State, when not dealt with directly, comes logically within the trade influence of Bombay, and the last named is strongly influenced from Madras. Most of the places shown within Central India and the Central Provinces being on or near the main transcontinental routes, more Calcutta controlled agencies might be established.

**Registration of Motor Cars, Trucks and Cycles in British India  
as of March 31, 1920**

	Cars and Trucks	Cycles	Total
Bengal (Calcutta).....	6,373	1,542	7,915
Assam .....	355	83	438
Bihar and Orissa .....	1,020	375	1,395
Delhi .....	204	69	273
United Provinces (Allahabad) .....	1,076	556	1,632
Punjab Provinces (Lahore) .....	1,617	1,108	3,618
Bombay (includes cycles) .....	10,180	...	10,180
Sind (Karachi) .....	428	209	637
Madras City .....	2,846	1,389	4,235
Madras Presidency .....	920	710	1,630
Central Provinces ((Nagpur).....	423	302	725
Rajputana (Mount Abu) .....	29	20	49
Northwest Frontier Prov. (Peshawar) ..	476	371	847
Burma (Rangoon) .....	2,432	1,186	3,618
Ceylon (Colombo) .....	3,000	1,650	4,650
<b>Total .....</b>	<b>28,379</b>	<b>7,920</b>	<b>36,299</b>

In the thirteen months following the above registration date, to April 30, 1921, the total imports of vehicles into India from all sources was approximately as below:

Cars .....	15,757
Trucks .....	2,957
Cycles .....	5,187
<b>Total .....</b>	<b>23,901</b>

Some presentation of territorial arrangements of the Ford dealers in India is interesting. The Ford Motor Co. of Canada, Ltd., supplies the Indian market, and in relative local advertising to the distinctive Ford trade emblem is added the legend "Made Within the Empire."

The currently announced arrangements of the above firm for India are as follows:

**Bengal-Assam-Bihar and Orissa-Delhi District and United Provinces**

Kilburn & Company, Managing Agents, Calcutta.

Ford Motors (Calcutta), Limited, Calcutta and Dhanbad. (Dealing exclusively in Ford Products.)

Works and chief service station, Russa Rd., Calcutta.

Town service station, Mission Row, Calcutta.

Sales and showrooms, Chowringee Road, Calcutta.

Branch and service station, Dhanbad.

**Sub-Agents**

Bengal—Ford Motors (Calcutta), Ltd., Dhanbad.

Bihar and Orissa—Arthur Butler, Ltd., Muzaffarpur.

Khemraj Puramall Sarawji, Ranchi.

Massidin Bros., Bhagalpur.

Delhi—Russa Engineering Works, Ltd., Delhi.

Mohd. Ekram Khan & Co., Benares.

The Cawnpore Motor Co., Cawnpore.

The Oriental Motor Car Co., Lucknow.

H. Pestonji & Co., Agra.

The Star Motor Co., Dehra Dun.

Gilbert & Sons, Allahabad.

Assam—Russa Engineering Works, Ltd., Dibrugarh.

Kilburn & Co., Tezpur.

John Smeal & Co., Silchar.

G. F. Jeffrey, Esq., Manipur.

Central Provinces—The Bundelkand Cycle and Motor Co., Jhansi.

A. Ahmedjeebhoy & Co., Raipur, and The Krishna Stores, Aligarh.

North Indian Motor Co., Bareilly.

The Punjab Motor and Carriage Co., Karnal.

Norman Orde & Co., Meerut.

Burma—Ford Motors (Burma), Limited, Rangoon, Burma.

**Bombay-Baluchistan-Punjab and Northwest Frontier Provinces**

Ford Automobiles (India), Limited, Bombay and Lahore.

Madras—Oakes & Co., Madras.

Ceylon—Brown & Co., Limited, Colombo.

Kilburn & Co., mentioned above, are the managing agents of the firm, Russa Engineering Works, Ltd., with principal offices at Calcutta and branches at Bombay, Dibrugarh, Gauhati, Tezpur, Karachi, Lahore, Delhi, Jorhat, Rangoon and Madras. This is the most important and extensive motor trading organization in India, their American agencies including Hudson, Essex and Paige cars. There are other important motor car firms having principal offices at chief coast ports and branches at other trade centers.

The British Indian Empire contains 1,802,657 square miles; the provinces under British administration (Bengal, Assam, Bihar and Orissa, Madras, Bombay, Baluchistan, Northwest Frontier, Punjab, United Province, Central Province, Burma, Ajmer, Coorg and Andaman Islands) comprise 1,093,074 square miles, or 60 per cent of the total. The remainder is included in the Native States. The total population of British India is 315,156,396, of which British territory contains 244,267,542, or 77½ per cent, and the Native States 70,888,000, or 22½ per cent. (The gross population of India is not particularly significant to a review of the motor trade of that country.)

These stupendous figures can be grasped only by contrast. The area of India is equal to the whole of Europe, except Russia. Burma is about the same size as Austria-Hungary; Bombay Presidency is comparable in area with Spain; Madras, the Punjab, Baluchistan, Central Provinces and Rajputana are each larger than the British Isles.

The population of India exceeds that of Europe without Russia and is three times that of the United States. The United Provinces and Bengal, with the Native States attached to them, both have as many inhabitants as the British Isles.

All of the Native States are under the control of the Indian Government, but generally they are not under British Indian Government administration. It is impossible in this article to attempt any comment on the diverse conditions present in these states. Their present value to the motor trade is generally unimportant, except as regards limited purchases of highest priced cars by the rulers of various states, however, the potentialities of future trade are interesting, as undoubtedly motor transport and trade of contiguous districts where that trade is developing rapidly will have an effect.

At and from Calcutta, a city enjoying financial, industrial and commercial supremacy in India, motor trade has experienced its greatest development in India.

Delhi, the capital of India, is rapidly attaining major importance as a motor trade center. British firms are extending their organizations thereto.

At Madras, British enterprise dominates trade. The territory served therefrom is mainly dependent on agricultural industry; comparative poverty in readily exploitable mineral wealth and difficulty of coal supply has prohibited any industrial development comparable with Calcutta and Bombay. The Native States of Mysore in this territory is rated more progressive than other states and motor trade is active there. What little motor business is to be obtained from the Native State of Hyderabad is strongly influenced from Madras.

Within Bombay motor trade development ranks with that of Calcutta. The cotton trade and industry of India is practically centered at this place. Native capital and individuals participate in the industry and commerce of Bombay to a degree not present at the other coast towns mentioned, and this element is practically the dominant factor. Places and territories tributary to Bombay do not at this time offer like opportunities for motor trade development to those present from Calcutta. Native

States within and without (Rajputana and Central India) the Bombay Presidency present obstacles to a free diffusion of motor trade and its development.

Bombay trade has at this time considerable influence with Mesopotamia resulting from new trade routes defined by the war's exigencies, and the writer is informed that Ford Automobiles (India), of Bombay, control that territory for the particular products they represent.

Karachi, which was formerly a motor trade tributary of Bombay, has attained much independence of position during recent years, and the trade there is worthy of and desires treatment as a principal motor trading point from which the territories of Sind District, Bombay Presidency and Baluchistan would be served.

Lahore, as the distributing point for the Punjab provinces, has been a trade tributary to Bombay, and as a motor trade center has attained importance within itself and relative territory. A few Bombay motor firms maintain branch establishments there.

At Rangoon there are only a few important motor firms, the major portion of which are British. In Burma one comes in contact with the Chinese element in commerce, and in recent years they have entered somewhat into the motor trade. The interior motor trade of Burma is for the present far behind similar trade in other British provinces, probably due to insufficient enterprise. Only a few firms have been concerned with the trade there in the past, but an interesting development of motor trade anticipated.

At Colombo, Colony of Ceylon, the motor trade is mostly in British hands and an intensive trade in this limited territory is well developed. As in India the largest motor trade organizations are of British and Continental ownership and management and are exceedingly enterprising in the development of business. Native wealth and a considerable number of native firms are concerned with the motor trade. In Bombay native owned and managed motor firms rank among the foremost. With a few conspicuous exceptions native firms do not possess facilities comparable, either in employees or establishment, with those of British firms, and in the matter of a consistent loyalty to a particular agency franchise in the face of many solicitations to undertake others, much may be desired. It is believed, however, that much is to be gained by American car manufacturers cultivating such firms and assisting their development. Trade at present with some of the lesser native firms is complex, and if business is undertaken direct it should be carefully considered in all its aspects.

Only those who have had an intimate and comprehensive experience in recent years with the trade under review can fully appreciate the extraordinary development of motor car use within India that has occurred during the past few years. The relative trade development has been insufficient for effectively dealing with present and prospective opportunities and problems, although the present development is creditable to those concerned therewith, in view of the facilities at hand.

The motor car has not only caused some congestion of trade, but more congestion of traffic in the large cities where large quantities of cars were absorbed, as at times and places the native bullock cart determines the movement of motor traffic. Motor vehicle having demonstrated its efficacy and necessity to metropolitan transport problems, the elimination of the native cart is a matter of serious consideration on the part of authorities in the large cities. The report of a committee appointed to consider the problem of rapid transportation to and from Calcutta states that the replacement of bullock and buffalo cart transport by motor transport is an urgent necessity and recommend that the possibility of fixing a definite date after which bullock and buffalo carts will not be permitted to use the streets be very carefully considered.

Throughout the interior of India are great systems of roads and practically all of the places shown on the accompanying map are connected by main trunk roads, and these are supplemented by a comprehensive system of secondary roads.

Total mileage of railways in India open for traffic exceeds 36,000 miles. Total number of passengers carried by all railways annually is approximately 500,000,000, and total weight of goods carried, approximately 90,000,000 tons. Railway transport supports 1,062,493 people, the estimated number of actual workers being 474,184.

That India is experiencing a reaction from extraordinary prosperity and an exceptionally unsatisfactory internal trade year, does not alter the future outlook for motor trade in that market. There is a large trade to be obtained there by American manufacturers in the future, but it is necessary to discount much of the war and post-war experience, as radically changed trade conditions are now present. Trade possibilities exist and can be secured by American manufacturers if they are prepared to face competition and meet the conditions here outlined.

## Tractors Used in Alaska

**T**RACTORS have succeeded dogs as the motive power for freight in many parts of Alaska, where these tractor trains are now operated regardless of the low temperatures. This is made possible by a recently perfected frost pad which protects the cooling system in all temperatures. These machines have kept to their freight schedules at 40 below zero. The photograph shows a Holt tractor with its train.

An engineering asset of this particular machine will be found in the articulated roller frame and the equalizer bar which join the two portions of the tractor truck and supporting roller. This latter factor enables the tractor to conform to the unevenness of the ground and to climb over obstacles and yet assures traction. It is one of the refinements and modifications made possible by war experience. In one district the tractor has caused a drop of winter freight rates from \$350 to \$25 a ton.

Holt tractor used to haul freight in Alaska

# Inaccuracy of Current Unemployment Statistics

Present unemployment statistics are based upon past employment figures which were abnormal. Mr. Tipper discusses the inaccuracies and points out the danger of hasty conclusions. The importance of the problem is not minimized, however, since responsibility must be recognized.

By Harry Tipper

**A** CONSIDERABLE amount of discussion has been going on in the newspapers concerning the changes in employment and the extent of unemployment in the various parts of the country. These discussions have been reinforced by statistics from State and Federal authorities and from the American Federation of Labor—the only places where general statistics are accumulated from the original sources regarding the degree of employment.

A great deal of stress has been laid upon the amount of unemployment and the figures of the actual number of people unemployed have been used many times to inforce an argument or to illustrate a condition.

That there is a great deal of unemployment is unquestioned. The lack of activity in many industries and the reduction of activity in many others from last year have altered the amount of employment in connection with these industries and the workers who have been let out have either swelled the ranks of the unemployed or found work of some kind elsewhere.

It is very difficult, however, to arrange general statistics so that they are reasonably accurate, unless all the factors are known and considered in the analysis of the individual statistics from which the general compilations are made.

The spirit of turnover in labor has its effect upon the number engaged in or liberated from an industry, as the amount of production fluctuates. The tendency of workers to move about in their own special occupation from one establishment to another or from one industrial group to another makes it a very difficult matter to determine the actual number normally engaged in such industries or to determine the net number left out of employment as they readjust themselves.

There are no statistics indicating the number of people who came from the farms during the high wage period at the end of the war and who have returned to their original occupations. There are no statistics indicating the number of women who entered employment at that period but who were normally unemployed in industry and who have since gone back to domestic occupations.

It is impossible to determine those who have been re-employed perhaps casually and perhaps on short time since they were discharged from the industrial jobs they previously held, and the relative factor of turnover has not been determined in any of these cases.

As a consequence, the statistics of unemployment are very inaccurate as an index of conditions and more inaccurate as an index of the fluctuation of

buying power. The statistics of unemployment have run between four and six millions for several months, rising and then falling as the depression developed.

It is obvious that the straitened circumstances of the workers would be more visible and the distress more acute if these statistics could be accepted on their face value. The savings of the worker on the average are not sufficient to withstand a long siege and unemployment to this extent would put a severe strain upon the resources before such a long period had elapsed.

During the war and after the end of the war there was an abnormal employment in many lines of industry, recruited from other lines of work. The bidding for labor had proceeded to such lengths that men without familiarity with the particular industry were accepted so long as they had a modicum of skill in the particular occupation. Those industries where the pressure for production was greatest offered the largest inducements to the workers and drew many employees from outside industries, from the farms, and from various occupations.

Such employment was abnormal, temporary, and did not represent any of the conditions of the industries in question.

The depression has not been equal in all lines. The percentage of production has varied very considerably and along with the unemployment there has been a certain amount of re-employment going on all through the depression and a return of the workers to their original occupation or type of life.

It will be impossible to get a true picture of the extent of unemployment in each line of industry until the reports received by the governmental authorities and the Federation of Labor are more detailed and the analyses more accurate in arranging the general compilations.

Furthermore, it is impossible to determine the number of workers employed in industrial occupations, for the same reason. The number of people applying for particular kinds of work and the number of people waiting for the possibility of work are a much better indication of the local conditions of employment than the general statistics as they are gathered at present.

This does not minimize the seriousness of the situation, however, and the extent of unemployment existing at present, nor does it solve the problem nor offer the slightest suggestions for solution.

As the organization of industry becomes more complicated, the possibility of balancing the industrial organization so that its employment for all the workers within

the field becomes more difficult. The increased subdivision of the work and the rigid limitations of the system remove the flexibility from the workers' skill so that there is no opportunity to adjust the work for the maintenance of a reasonable proportion of the various occupations required for the industrial group or establishment. When they are used to working at a simple subdivision of an occupation, with its rigid and monotonous technique, the workers lose their capacity and adaptability and they are unable to operate under new circumstances.

This difficulty has been experienced for a great many years in Great Britain where the unemployment has been a continuous problem for a quarter of a century at least.

The problem has not been of great importance in this country up to the present because a large part of our working population is drawn from immigration and most of the immigrants have been accustomed to the adaptability of the older methods practised in the countries from which they come.

Nevertheless, the increasing rigidity of labor is a problem directly connected with the future of the unemployment question and the organization of industry will be obliged to answer in some way or another the question of reasonable permanent employment within the industrial group. When the worker is willing to work and cannot find work because the instruments of his skill are idle, he is likely to charge industry or his government with responsibility for his condition.

Where the unemployment becomes a continuous problem for a number of years, as it has been in Great Britain, this demand settles into a well-defined policy of action and may result in governmental interference with its burden of taxation and its obnoxious regulation.

It is amazing that so little attempt has been made to consider the factors, the difficulties, and the responsibilities in the question of unemployment and that so much unrest is allowed to foment quietly because numbers of workers are deprived of their work without ap-

parent cause and have no other outlet for their restless activity save their thought upon the matter.

The general employment statistics as they are reported at present undoubtedly exaggerate the difficulty because the factors of re-employment and adjustment have not been considered in the compilation.

Accurate statistics on this matter are very desirable. Ignorance of the problem leads to a great deal of idle speculation and misapprehension on the subject. Some of the editorials which have been written in the newspapers would have been differently arranged if all the factors were understood and much of the propaganda that has been spread out to the unemployed would have lost a good deal of its significance.

Without a knowledge of the factors, attempts to relieve the situation have proved expensive and inefficient wherever they have been tried by authorities although small experiments by local communities and local establishments have met with some measure of success.

The whole question of statistics on labor is important and complicated, but particularly in the fluctuation of unemployment better examinations are necessary, more correct analyses and compilations should be established. Of course, this cannot be done until the manufacturer and employer generally have developed more accurate statistics and are in a position to give these detailed analyses to the governmental authorities.

As it stands at present comparatively few factories have all the necessary records in such shape that they represent a true analysis of the employment situation in their case. Consequently, the general statistics provided from hundreds of thousands of sources are arbitrary and inaccurate. Because they are inaccurate they lead to false conclusions and enlarge the difficulties of the case.

The unemployment problem is an important one, but it is not likely to be affected by experiment until the factors that enter into it are more definitely understood in their relative influence upon the fluctuations.

## Service Dominant Idea at M. A. M. A. Credit Meeting

(Continued from page 554)

"D—Is the buyer a corporation, a partnership or an individual?"

In a paper prepared by F. N. Sim, advertising and assistant sales manager of the Timken-Detroit Axle Co., who was unable to be present, he advised the revamping of sales strategy.

"Let's stop trying to get temporary advantage of each other by untimely price cuts, market juggling, etc.," he said. "Let's have plenty of competition but let's make it good-natured and square and then let's spend most of our time making people want to buy automobiles."

"Let's revamp our advertising, change our selling talk and revolutionize our thinking on this subject."

"There are thousands of car and truck owners secretly wishing someone would come along and persuade them to buy. They want to be sold. The buyers' strike they talk about is in the majority of cases a mental attitude. It is not wholly sincere. While there may be somewhat less buying power at present, there is enough on tap to keep the industry moving."

Ezra W. Clark of the Clark Equipment Co., Buchanan, Mich., advocated intensive development of the special motor bus as a means of increasing

business. He said experience had shown that converted motor truck chassis would not serve the purpose. He declared there were tremendous possibilities along this line and that his company was taking advantage of them by building special motor bus axles.

E. H. Broadwell, vice-president of the Fisk Rubber Co. and president of the association, presided at the sessions. M. L. Heminway, the general manager, sketched the achievements of the year, paying particular attention to the plan of forming groups of manufacturers in the same line of business.

The association's credit department as "the safety valve of the industry," was described by C. A. Burrell, the efficient manager of the department. The work of the department has been done so well that he was able to tell the members that if they had been governed entirely by its reports they would not have a bad account in their books. The department is intimately familiar with the financial affairs of nearly 800 manufacturers and more than that many jobbers. Members were urged to make wider use of the credit department.

"The industry is fundamentally sound," Burrell said, "Morale is what wins battles and the automotive industry never retreats."

## Maintaining Quality

**I**N cutting the cost and selling prices of passenger cars, is quality going to suffer? Every car manufacturer is welcoming with open arms any practical means of decreasing cost of manufacture. This is as it should be so long as quality is not sacrificed at points where it is essential to proper performance. There are places in some designs at least where machining limits are held much closer than necessary. In such places a saving can often be made by allowing wider limits without changing performance in the slightest degree. But this legitimate saving should not be the signal for using less care in maintaining close limits where these are required for proper running fits and adequate durability.

One of the greatest savings in manufacturing cost is that resulting from more efficient labor. Several plants are now building nearly twice as many cars in proportion to the number of men employed as were built when labor was at a premium and inefficient.

Since the cost of material is one of the largest items in the total cost, there is, of course, chance to econo-

mize in that direction, but the danger here is very great. The purchasing agent should rely upon the judgment of the engineering department and make no change in favor of a cheaper article until it is evident that the change will not adversely affect the performance of the finished vehicle. A large percentage of orders for cars to-day are repeat orders, and nothing can upset this condition more certainly than a cheapening which renders performance less satisfactory or renewal and service charges more frequent.

Much has been done and is still being done to decrease the cost of manufacturing processes, but there is reason to believe that similar economy has not been brought about in the purchasing and selling departments. Selling costs are too high. Improved and more economical purchasing methods are possible. These are questions which every wise manufacturer should weigh carefully.

Cost cutting at the expense of quality is at best a dangerous proceeding. In any case it should not be resorted to until every possible economy in purchase, manufacture and selling has brought the cost as low as this practice permits.

## Export Market Outlook

**D**URING the year 1920 American automotive exports attained the enormous value of over \$382,000,000. In recent years our exports have grown at a tremendous rate, as may be judged from the fact that as recently as 1914 our car and truck exports together were valued at only \$28,000,000. This growth came about without any great efforts on our part. Throughout the war there was no competition in foreign markets, as all the industrial countries were engaged in the fray; in fact, the needs of the belligerents greatly swelled our exports. After the war, for a period extending over nearly two years, the industries of most of the European industrial countries were unable to produce a surplus for export, partly owing to the difficulties of getting back to a peace basis and partly owing to the abnormal demands of their own home markets. The American industry alone was prepared to make deliveries, and it reaped the advantage of this preparedness.

The period of no competition in the world's automobile markets has come to an end, and the question now is whether we can hold our own under the new conditions. On the one hand the outlook seems promising. Large-scale production of automobiles as we know it to-day is confined practically to this country, and where purchasers buy strictly on the basis of price and service value we will probably have little difficulty in meeting all competition. One thing in our favor is that technical development never stopped here, while little was done in Europe along this line for about five years. Previous to 1910 most of the striking improvements in automobile design originated in Europe. Since then America has been leading in the creation of new features. We need only mention the electric starter, the spiral bevel gear and the vacuum fuel feed. There can be little doubt that such pioneering in technical development as represented by these improvements adds to the prestige of

the American car in the eyes of foreign buyers.

On the other hand, private passenger cars are not bought wholly on the basis of price and service value. Appearance, tradition and careful handwork in the finishing of mechanical details have their influence, especially on buyers in the higher priced classes and in countries where the automobile is less an article of utility than it is here. That we shall have a hard fight to maintain our pre-eminence in the export field is indicated by recent figures on Belgian imports. During the first half of 1920 the United States led in these exports by a wide margin, but since then there has been a very pronounced change. The imports from the United States have dropped to a small fraction of their last year's value, while those from France have increased remarkably, and the latter country has secured a wide lead in that market.

One reason for this change is undoubtedly to be found in the exchange situation. Dealers in Belgium importing cars from the United States must pay in dollars, which are at a very high premium as compared with the depreciated Belgian currency. When they import from France they pay in French francs, which are still more depreciated than Belgian francs. Besides, Belgium is more or less contiguous to the French industrial district, and its language is the same as that of France, which facilitates commercial intercourse. Perhaps the Belgian purchaser looks upon the French product very much like the Canadian upon the U. S. product.

The change in the Belgian imports shows that we have not a very firm hold on some of the markets acquired during the war. The consoling thought is that Belgium in this respect is not an average country, but is influenced by close business ties to one of the countries strong in automobile production.

## An Ideal Transmission

**T**HERE appears to be a disposition among many engineers to regard the present type of gearbox as so near to perfection that but little effort is being made to produce new and more suitable types. Certain changes in detail design or control mechanism are occasionally attempted, but the major elements have remained about the same for many years.

An ideal transmission would, however, have certain characteristics not possessed by the conventional type. The primary function of the gearbox is to increase the torque applied to the rear axle when the torque of the engine is not sufficient to propel the car at the desired speed, and the gearset must in any case perform this function if the engine is kept small and light. It is conceivable, however, that the gearset might be made to perform another function, namely that of so adapting the load of the car to the output of the engine that the latter would always operate at full load and consequently under most favorable conditions with respect to fuel economy.

Such a mechanism is theoretically possible. Whether it can be reduced to practical form and be so designed as to be manufactured at a reasonable price is a question which is at least worthy of careful consideration. The fuel saving which would be

made possible by such a device would be very considerable, since it is a well known fact that economy at full load is more than double as good as that attainable when the engine is throttled so as to run, as it does most of the time in the average passenger car, at one-fifth to one-third full load.

Efforts in this direction have been made from time to time in the case of gas-electric vehicles, but first cost, weight and other considerations have militated against their commercial success. It is not beyond the realm of possibility that the desired results can be attained by purely mechanical means. There is room here at least for the application of ingenuity which might bear good fruit.

## Producing Closed Bodies

**R**EPORTS from various parts of the country indicate that the increased interest of the public in closed models may have a favorable effect upon fall and winter sales during the coming year. Answers to a questionnaire recently sent out by AUTOMOTIVE INDUSTRIES, moreover, indicate that manufacturers are greatly interested in the permanent top. Several are going to equip at least one model with permanent tops as standard equipment. Many others are seriously considering such a step in the near future.

This interest in permanent tops, together with the recognized gain in popularity of the regular closed job, brings to the foreground body production problems that hitherto have not been prominent. Price is undoubtedly a large factor in limiting the number of closed cars sold at present. Many persons who can afford to buy a given open car cannot afford to pay \$600 more for a closed job. The increased cost of the closed car lies very largely in production difficulties at present. Close study of body production methods may make considerable change.

One manufacturer stated recently that he considered it perfectly possible to so perfect closed body production methods and equipment that a closed job could be turned out for the same price as an open one. In fact, he has set out to do this very thing in his own plant. Whether or not he is successful, he is undoubtedly correct in his belief that the cost of closed body production can be materially reduced.

Improvements both of design and production, moreover, may be expected in permanent tops, so that the cost of these will be correspondingly reduced. Very close attention can well be given at this time to both the market analysis and production problems of the permanent top and the closed body.

**I**F every car and truck manufacturer would make it a point to see that each new model is capable of traveling under average conditions farther per gallon of fuel than the next earlier model the total saving in fuel during the life of the vehicles so improved would be astounding. Certain vehicles now extensively used in New York average nearly eight miles per gallon. A few years ago similar vehicles in the same service made about two miles. Persistent effort might easily produce similar results with other vehicles. Isn't it worth trying?

# Sales Exceed Dealers' Expectations

## New Price Cuts Have Not Deferred Buying

### Entire Industry Surprised at Way Business Holds Up—No Real Slump Likely

NEW YORK, Sept. 21.—Probably the most striking fact disclosed by a study of conditions in the automotive industry is that they continue to be better than expected. August was the best month of the year. When price cutting began at the end of August the general belief was that there would be a sharp falling off in retail sales on the theory that prospective buyers would hold off in the expectation of further cuts. No accurate data are available on this subject, but reports from numerous distribution centers indicate that sales are holding up very well in comparison with August, and that if there is a falling off it will not constitute anything in the nature of a "slump."

#### Continuance in Doubt

It is not to be expected that sales will continue at the present level until the beginning of 1922, but neither was it to be expected that business in July and August, which has been a perennial slack season, would be as good as in May and June, which ranked among the best months of the year. Manufacturers believe there will be a gradual "tapering off" the rest of this year, but this "tapering off" is not yet strongly in evidence.

Judging the rest of the year by the experience of the first eight months, the decline in sales will not be as sharp as has been expected. There is in prospect an unusually heavy demand for enclosed cars, and many attractive new models will be brought out this fall at prices much less than those which prevailed a year ago. This will tend to stimulate sales.

#### Buying Power in the South

Buying power is greater in the South than it has been in many months and there has been considerable stimulation in sales in that section. Farmers are coming back into the market to a certain extent and export trade is slightly better. The truck market, which has been virtually dead for months, is showing signs of life.

There probably will be a few more price cuts, but the indications are that there will be no epidemic of them, and the industry is hopeful that prices will remain fairly well stabilized until the

show period in January, although a period of sharp competition has returned.

Production for the industry as a whole is running about 70 per cent of the same period last year, but it should be remembered that production at that time had begun to fall off because of the "buyers' strike" which was well under way. A few of the quantity producers are running their plants practically at capacity, but it is probable a majority of the passenger car factories are running at not more than 50 per cent of capacity. It is difficult to estimate truck production, but on the whole it probably does not exceed 25 per cent of capacity. It is impossible to fix percentages of "normal" because what is "normal" for the industry has not been determined.

## Reorganization Plan for Willys in 30 Days

NEW YORK, Sept. 20.—Creditors of the Willys Corp. have been notified that while negotiations for a reorganization of the company have not progressed as rapidly as had been hoped, some definite decision is expected within 30 days. Committees representing the bank and other creditors are continuing their work.

The reorganization plan under consideration contemplates that a large part of the new funds needed will be provided by a prominent firm of New York bankers who have had an engineer's report on the Willys plant at Elizabeth. This report was delayed but it was presented to the bankers last week and a definite decision by them is expected soon. Creditors are warned that it would be extremely unwise to press claims at this time although the committees state that they will not consent to an indefinite delay.

## Truck Owners Fight Ohio Load Limit Law

COLUMBUS, OHIO, Sept. 21.—City and county officials assembled in the office of County Prosecutor King recently to discuss provisions of the Burke law, which limited the loads to be carried on the streets and highways of the State. The result was that steps were taken to enforce the law, which haulers and truck men believed to be very unreasonable.

The fight against the law in the conference was lead by Walter Francis of the C. & C. Haulage Co., representing truck owners, who declared that the enforcement of the law would work a great hardship on contractors and truck owners in general.

## Moline Refinancing Meets with Approval

### Proposed Capitalization Will Pro- vide Big Stock Issue—90 Per Cent Agree

MOLINE, ILL., Sept. 21.—New financing plan of the Moline Plow Co., which the bankers' committee believes will re-establish the corporation on a sound financial basis, has been outlined and approved by approximately 90 per cent of the interests involved.

Proposed new capitalization will provide for the \$10,000,000 of 7 per cent debentures, an equal sum in 7 per cent first preferred stock issue and \$7,500,000 in second preferred stock. Preferred stock issues will be entitled to cumulative dividends after two years. Common stock issue has not been determined, but \$10,000,000 common stock now outstanding will be traded in on the common at the rate of one share of new for ten shares of old. Majority of the common stock will be held by the protective committee for banking and commercial creditors for a period of years believed by the company sufficient to work out its difficulties.

Holders of \$7,000,000 of 7 per cent first preferred stock now outstanding will receive the new second preferred issue, par for par. Holders of \$1,500,000 of 6 per cent non-cumulative second preferred outstanding will receive one-third or \$500,000 in new common, it is said.

Banking and commercial creditors and holders of \$4,000,000 of 7 per cent notes outstanding will go into the new organization on an equal footing, it is reported. Their total claims aggregate \$20,000,000. These claimants will receive 50 per cent in debentures and 50 per cent in first preferred stock of the new issue.

Banks, it is said, have agreed to advance \$2,000,000 to the company on its notes, for immediate working capital.

## Cunningham Factory to Increase Production

ROCHESTER, N. Y., Sept. 21.—Improvement in business has been noted by James Cunningham, Son & Co., automobile manufacturers, during the past ten days and the company is planning on a production of 35 cars this month. Most of the machines are custom built. The company's 600 employees are working on a basis of 40 hours a week.

At the annual meeting of the stockholders held here this week, the directors elected are as follows: Augustine J. Cunningham, James C. Dryer, John W. Fulreader, Francis E. Cunningham, Campbell A. Baird.

# Peerless Deal May Be Closed Soon

## Collins Would Not Get Stock's Control

**Offers to Buy 80,000 of 200,000  
Shares at \$50—Half to Be  
Paid in Cash**

CLEVELAND, Sept. 20—Negotiations for the acquisition of control of the Peerless Truck & Motor Corp. by R. H. Collins, former president of the Cadillac Motor Car Co., and his associates, had not been concluded at a late hour to-night. Conferences lasted throughout to-day and far into the night. The indications are said to be favorable to a successful termination of negotiations. Attorney George B. Siddall of this city, who is secretary of the Peerless Company and has been named a committee with B. G. Tremaine, president and general manager of the corporation, to negotiate the deal, issued the following statement to-night:

"The trade with Collins has not yet been made but negotiations are still pending. At a meeting to-day progress was made but in a transaction of this importance there are many points which must be covered. The stockholders of the company may rest assured that all of them will be treated alike. It probably will be several days before the matter will be brought to a conclusion."

### Notification to Stockholders

Although no announcement as to details has been made by any one participating in the negotiations, information concerning it became available when circulars that are to be mailed to stockholders were seen. These are to be put in the mails when necessary signatures to the contract are obtained. The circular says that the negotiations at present are limited to B. G. Tremaine and his associates who are now virtually in control of the management of Peerless and its subsidiaries and R. H. Collins acting for himself and his associates for the sale of shares of stock in the corporation. W. C. Durant, former president of General Motors Corp., is allied with Collins. Another well defined report is that Collins will assume active management and that his word will be law as to whether or not there shall be changes in the personnel of the officers and directors.

All stockholders of the company are to be given an opportunity to sell their stock to Collins and his associates. Tremaine stipulated this should be done and his proposal has been accepted. Collins,

according to information contained in the circular notices that are ready for mailing to stockholders, is to purchase at least 50,000 shares and not more than 80,000 shares of the 200,000 shares outstanding. He is to pay \$50 a share for the stock, of which not less than \$10 a share shall be paid in cash and the balance in six equal installments which shall be paid semi-annually over a period of three years with interest at 6 per cent.

Stockholders who desire to sell on the terms given will be asked to deposit their shares with the Cleveland Trust Co. In the event that more than 80,000 shares are deposited under the agreement the amount of each stockholder's stock to be sold shall be such proportion as 80,000 shares shall bear to the total number of shares of such stock deposited. Thirty days are given for the consummation of the sale under the depositary agreement, provided, however, that the attorneys may grant an extension to not later than Nov. 15.

The Peerless company is one of the largest and most prosperous automobile plants in the Cleveland district. When operating normally it employs 2,500 men. The plant covers 20 acres and it has continued its payment of dividends this year. It has paid as high as 10 per cent annually on outstanding stock and the dividend this year is 4 per cent. The corporation has a capital of \$20,000,000 with approximately \$10,000,000 outstanding.

### Durant Personally Associated

NEW YORK, Sept. 21—W. C. Durant personally is associated with R. H. Collins in the negotiations for control of the Peerless plant but Durant Motors, Inc., is not involved. In this respect the relations of Durant with Collins are no different than they have been since the announcement several months ago when Collins left the General Motors Corp. that he would incorporate a Michigan company to manufacture a high class eight cylinder car.

Soon after the original announcement of Collins' plans he purchased one of the large units in the old Cadillac plant at Detroit. If his offer to the Peerless company is accepted the Detroit factory will be used for other purposes which he has in mind.

Acquisition of a well equipped factory such as that of the Peerless company will give Collins an opportunity to get to work at once with the organization he already has built up. His proposal to the Peerless company contemplates the complete redesigning of the car with the exception of the 8-cylinder engine, which he regards very highly. It is probable that in this redesigning he will put into effect most of the ideas he has had for a new car.

## A.A.A. Backs N.A.C.C. on Manufacturers Tax

**Senate Expected to Be Satisfied  
Industry Is United for  
Revision**

WASHINGTON, Sept. 21—Endorsement by the American Automobile Assn. of the proposed manufacturers' tax on commodities which the National Automobile Chamber of Commerce has recommended, is expected to make the Senate understand that the automobile industry, from manufacturer to user, is united in an effort to obtain a more equitable form of tax assessment through a revision of the present internal revenue laws. The Smoot bill, which would make the necessary revisions, will be introduced by Senator Smoot this week, when Congress reconvenes.

The brief in support of the plan is a substitute, for the House bill was filed on Saturday with the Senate Finance Committee by the Manufacturers' National Tax Committee, of which Charles E. Hanch of the National Automobile Chamber of Commerce is vice-chairman. The report which Hanch signed as chairman of the tax committee of the N.A.C.C. says that the Smoot plan is approved because:

"Without lessening the amount of revenue, it removes the burden of invidiously discriminating war taxation from selected industries upon whom it was imposed for the purpose of limiting particular production as well as raising revenue. The reason for such limitation having expired, the policy should die with it, or it should be a popular tax because its amount is definite and certain and its relation to costs easily calculated by the mass of buyers of average intelligence. It cannot therefore be made an excuse for unduly enhancing price or a mask for inexcusable extortion."

The A.A.A. directors, in a statement said that the main motive in endorsing the manufacturers' tax is to give relief to the business interests of the country and to provide employment to more than 5,000,000 now idle men.

## Report Ford Plant Will Run Only 5 Days Denied

DETROIT, Sept. 19—Reports that the Highland Park plant of the Ford Motor Co. would be operated hereafter on a five-day basis were emphatically denied. The plant was closed Saturday to balance stock, but work was continued as usual at all branches. The monthly production schedule has not been changed.

## Owen Tire Company in Receiver's Hands

### Action Follows Charge of Stockholder That Funds Were Spent Extravagantly

CLEVELAND, Sept. 21—Manton M. Scott, this city, has been appointed receiver for the Owen Tire & Rubber Co., which conducts a tire-making plant at Bedford, a suburb of Cleveland. The appointment was made upon the application of William C. Gleason, a stockholder.

Gleason in his petition set forth that there are 3000 stockholders of the corporation, whose plant is on a 14 acre tract. He said that the company is greatly indebted for large quantities of material, some of which has been delivered and some of which is to be shipped from vendees; that creditors are annoying the company with their claims, and that many threaten to sue. He asserted that large sums of money have been illegally paid out for salaries and as commissions and for expenses.

### Insolvency Alleged

The petitioner alleged that the company is not insolvent, and that a receiver was needed to protect company interest for the present, to conserve the interest of stockholders by withholding appropriations for extravagant purposes and to conduct the business.

The debts were placed at \$800,000. In order to pay claims, the directors are attempting to sell \$600,000 gold bond notes, but in the last 30 days only \$14,000 has been realized from these sales. The court is asked to restrain this action.

### Committee Is Named

On Aug. 8, a special meeting of stockholders was held and a committee was named to act with the directors and the active managers, but, it was charged, the proper co-operation could not be obtained.

At the plant of the company it was stated that the assets are greatly in excess of the debts and that the concern is far from being insolvent. The corporation was organized about two years ago.

## Gas Production 807,980 Gallons Lower in July

WASHINGTON, Sept. 19—Production of gasoline fell off 807,980 gallons per day during July, as compared with the month of June, according to estimates prepared by the Bureau of Mines to-day. However, the output for July represented an increase of 196,542 gallons over the daily average production for the year 1920. Stocks of gasoline on hand at the refineries were produced during the month of July by approximately 66,000,000 gallons.

The daily average production of gasoline for July was 13,536,833 gallons,

which is a decrease from June of 807,980 gallons per day, but this is an increase of 196,542 gallons over the daily average production for the year of 1920. Stocks of gasoline on hand at the refineries were decreased during the month of July by approximately 66,000,000 gallons.

The daily average production of lubricating oils for the month of July was 22,635 larger than the production for June. Stocks of lubricating oils were decreased during the month of June by 2,244,823 gallons.

## 15 Per Cent Cuts Made on Standard Trucks

DETROIT, Sept. 16—Price reductions averaging 15 per cent on its entire line were made by the Standard Motor Truck Co. to-day, the announcement being based upon a general reduction determined upon by leading parts makers, and by manufacturing economies effected through higher labor efficiency.

The new Standard prices are:

	New	Old
Model 1-K 1-1½ ton....	\$1,800	\$1,950
Model 76 2½-3 ton.....	2,000	3,100
Model 66 3½-4 ton.....	2,800	4,000
Model 5-K 5-7 ton.....	4,400	5,250

Under the influence of lower prices a much more active demand in heavy duty trucks is looked for by Standard in the remainder of the month of September with probable increases in October and the early winter months. August without any particular sales stimulus proved to be the best month the company has enjoyed in a year.

## Aircraft Plant May Be Built in America

WASHINGTON, Sept. 19—It appears that the plea of the National Advisory Committee for Aeronautics for further researches into dirigible transportation will have a salutary effect upon the development of this industry in the United States. The destruction of ZR-2, built in England for the United States Navy, brought about the resolution of the Advisory Committee and may result in the establishment of an aircraft plant in this country under the auspices of the Government, in order to conduct experimental work for obtaining definite information regarding the strength and quality of materials and girders used in the construction of airships and for the development and checking of theories used in the general design of airplanes.

Several groups of American financiers are deeply interested in the promotion of aerial transportation, especially through the use of rigid air ships. Negotiations are now under way with the DuPont, U. S. Steel Corp. and General Electric Co. and other powerful financial interests for the establishment of dirigible routes to New York and Chicago. Several conferences have been held and experts employed by the syndicate have reported a system of dirigible transportation would be feasible and profitable.

## Senate Revenue Bill of Interest to Trade

### Revision Permits Manufacturers to Compute the Tax on Wholesale Sales

WASHINGTON, Sept. 19—While the final revision of the House internal revenue bill in the Senate Finance Committee made little change in principle, the new administrative methods proposed in the Senate bill are of particular interest to automobile manufacturers and dealers. The revision of Section 900 of the present law permits manufacturers to compute the tax upon retail sales on the basis of their wholesale selling prices in cases where they are doing both a wholesale and retail business. The House bill which repeals this provision of the present law was approved by the Senate Finance Committee but subsequently under the pressure of complaints from automobile manufacturers and others, it reconsidered and finally made the required change.

### Important to Manufacturers

This change is particularly important to manufacturers maintaining branch offices, as the House bill would allow private dealers to sell cars much cheaper than branch establishments, thus making a discrimination.

Because of the recent complaints from the automotive trade, the Senate Finance Committee reconsidered its endorsement of the House bill, changing the language of Section 900, dealing with tires, inner tubes, parts or accessories, and restored the language of the present bill. Dealers and others in the industry contended that the change in the language would allow new interpretations and cause much confusion in the administration of the act.

The Senate Finance Committee also amended a clause in Section 901, in which affiliated corporations may base their taxes on price of sale, instead of purchase price. It is revised so that the price must be the fair market value. This change, if approved by the Senate and the conference, will affect many holding corporations in the automotive trade.

## Ford Foreign Output 6140 Cars in August

DETROIT, Sept. 20—A statement from the Ford Motor Co. says foreign plants during August produced 6140 cars, of which 2773 were turned out at the Canadian plant. Buenos Aires made a large increase in output. Total revised output both domestic and foreign for August was 118,100 cars. Kearney assembling plant was a leader in larger output, with Detroit second and Philadelphia third. The total output for four months ended Aug. 31 last was 426,759 cars.

## Federal Finances for Export Firms

### But Automotive Concerns Have Made Little Effort to Obtain Assistance

NEW YORK, Sept. 19—Manufacturers and exporters of automotive equipment have made little effort thus far to obtain assistance from the War Finance Corp. in financing their foreign trade. This corporation, whose powers were recently amended by act of Congress, is the governmental agency which has a lending power of \$1,000,000,000 created for the sole purpose of helping American exporters to build up their overseas business and to supply them with credits that cannot be obtained from banks and other institutions.

#### Broad Powers

Its broad powers and its specific application to the automotive industries were outlined here to-day by W. G. Bogue, the legal representative of the corporation, which has its offices at Washington. He stated that no reason existed why its financial facilities could not be extended to the automotive industry and that the corporation already had granted large credits to manufacturers of machinery and locomotives. That similar credits could be extended to the automotive industry is the belief of Bogue, and he added that manufacturers who stand in need of such assistance should submit specific proposals either to himself or direct to the corporation at Washington.

"So far as I know," he said, "only two or three efforts have been made by the automotive industries to obtain credit, and we have naturally presumed that they were not in need of such assistance. The first of these efforts was that of an American company which had an order for 50 trucks for a foreign government. Financing was asked for, but the corporation found that the trucks were destined for war purposes and the business was refused, the only reason being that the products were not to be used in peace time pursuits. Otherwise, I am sure the credits would have been granted."

#### Scope Not Realized

"A second request is now before the corporation; the proposal having originated here last week and having been forwarded by me for final action. This concerns an export order for tires and accessories, and, I hope, will be successful."

Many exporters have believed, without any reason for such belief except newspaper stories, that the corporation would aid only in the financing of agricultural crop shipments. This is in error, as was revealed by a recent announcement of financing offered on sugar machinery and locomotives. The institution was organized and is being used for the aid of all exporters of American products,

either raw or finished, except for war purposes.

The corporation deals directly with the American manufacturer or shipper, and the credits are given to him. This is the opposite of the case with the financing companies organized under the Edge act, which furnish credit to the foreign purchaser. All dealings of the War Finance Corp. are with the American company and credit is extended upon the presentation of negotiable security, the American company, of course, being held responsible for the payment.

#### Five-Year Credits

Furthermore, the exporters must show that the financing cannot be handled through the customary banking channels. Credits may be extended for as long as five years, although they generally have been for six, nine or twelve months. The longest credit now outstanding is for two years.

"The bulk of our recent financing has been of agricultural commodities," Bogue said. "But it is not the purpose of the corporation and its present activities to slight manufacturers. Exporters should submit specific proposals and, as the activities are being conducted without red tape, they will receive satisfactory and immediate action."

The offices of the corporation are in the Treasury Building at Washington, and all credits are granted from there.

## N. A. C. C. Makes Headway on Insurance Reform

NEW YORK, Sept. 19—Considerable progress is being made by the insurance committee of the National Automobile Chamber of Commerce in its negotiations with the leading insurance companies looking toward reduced cost of insurance on motor vehicles. It is felt that only a negligible proportion of underwriting losses can be traced to construction features of the cars and that external causes account for most of them.

Continued thefts of large numbers of cars in certain districts have been reflected in premiums which now have reached an almost prohibitive point. Measures for curtailing these thefts are having the active attention of car makers and underwriters. Rigid enforcement of laws proposed or already enacted, it is believed, would do much to meet this situation.

#### GOOD MOTORCYCLE MARKET

COLUMBIA, S. C., Sept. 20—Motorcycle companies would seem to have a fertile field in some of the counties of this State, for six of them have not a single motorcycle, according to registration figures compiled by the State Highway Department. The six counties reporting no motorcycles are Bamberg, Barnwell, Calhoun, Jasper, McCormick and York. Another interesting fact brought out in the registration figures is that there was, up to Aug. 31, but one automobile dealer registered in Berkeley County.

## Lima, Peru, Takes Up Motor Bus Travel

### Converted Ford Trucks Now in Use—Regular Services Are Established

LIMA, PERU, August 31 (*By Mail*)—Motor bus transportation is on the increase in Lima, Peru. In addition to the two large European buses (De Dion-Bouton) with solid tires that were recently put in service between Lima and Miraflores, one of the suburbs, a popular priced light American truck (Ford), with pneumatic tires, has been converted into a bus and is running between Lima and Magdalena, another suburb of the capital. Other and larger trucks have been converted and are running over the same line.

During a recent strike on the inter-urban electric car line, these converted buses did valiant service, working overtime, hauling stranded suburbanites to their homes. Improvised buses, with nothing but planks for seats, resting on the side boards of the trucks, did good business.

#### Regular Bus Service

A regular bus service has been instituted between the center of Lima and a point on the outskirts of the city, known as Bolognesi Square. The fare is 10 cents Peruvian (less than 5 cents gold), the same as first class fare on a street car. The fare by motor bus from Lima to the suburbs is about twice what it is by electric train line, but up to the present time the buses are doing a good business.

For years Lima has had a public taxi service. There are now more than 500 light cars in this use, and numerous larger cars. The fare for a trip within the city limits is 50 cents.

Motor truck freight transfer has been in practice for some time between Lima and Callao, the port of Lima, a distance of nine or ten miles. In spite of a bad road the trucks are competing with a steam road and mule carts. There are perhaps 225 or more trucks, the majority light trucks, in use in Lima and the immediate surrounding territory.

A possible market for motorcycles is developing in Lima, owing to the fact that the roads between the capital and some of the suburbs have been a little improved. The consumption of gasoline is on the increase in Lima. It is estimated that at least 25 per cent more gasoline will be used in Lima in 1921 than in 1920, though the increased consumption is probably due to the larger number of small cars running.

It is possible that the tariff on automobiles and kindred lines may be lowered. This makes buyers cautious. But should this reduction take place, taken in connection with the fact that cotton, one of Peru's chief exports, is advancing in price, makes the future look encouraging.

## Show Managers Plan Promotion Schemes

Enclosed Car "Weeks," Appreciation and A. E. A. "Days" Discussed at Meeting

CHICAGO, Sept. 21—An Enclosed Car Week this fall and special days at the winter shows as agencies of stimulating sales were suggested to the trade by the National Association of Automobile Show and Association Managers, which has been holding a sales promotion meeting here this week.

The show managers, representing a majority of the larger dealer associations throughout the country, met here to exchange ideas and make them available for the trade generally on ways and means of arousing public interest in automobiles throughout the fall and winter, and turning that interest into sales profits for dealers. It was brought out before the meeting was hardly under way that trade associations in six large cities—Kansas City, Detroit, Buffalo, Brooklyn, Syracuse and Rochester—had completed plans for Enclosed Car Weeks in October. Other cities were reported considering the idea and general discussion indicated that quite a large number of "weeks" may be looked for in October and November. The six cities named will have their "weeks" in October.

### Special Days Urged

The association recommended to dealer associations and show managers generally that special days be set aside during their winter shows as Appreciation Day and Automotive Equipment Day. Appreciation Day was suggested by E. E. Peake, manager of the Kansas City Motor Car Dealers Association and president of the shows managers' organization. Peake tried out the idea last winter, first appearing before civic organizations and explaining the importance to the city of the automotive industry. His request that these organizations support the show in appreciation of their acknowledgment of the industry's part in the progress of the city resulted in much favorable publicity and in the largest show crowd in Kansas City history on Appreciation Day, which took the place of the former Society Day. Automotive Equipment Day was suggested by Ray W. Sherman, merchandising director of the Automotive Equipment Association, who said that his organization would be able to co-operate with manufacturers, jobbers and dealers in utilizing the day for promotion purposes.

### Merchandising Discussed

The association spent the greater part of a day discussing merchandising methods, with the idea of taking home new ideas to their associations and individual dealer members. On this subject they heard addresses by W. Frank McClure, sales promotion director of the

Fort Dearborn National Bank of Chicago and chairman of the national commission of the Associated Advertising Clubs of the World, and G. Raymond Schaeffer, advertising manager of Marshall Field & Co. Both men advocated for mercantile as well as for manufacturing businesses use of institutional and confidence building advertising in addition to more commodity advertising.

Among the larger cities represented at the convention by association managers were: Detroit, Kansas City, Cleveland, Buffalo, Brooklyn, Syracuse, Minneapolis, Newark, St. Louis and Des Moines.

## Milwaukee Looks for Gains Through Cuts

MILWAUKEE, WIS., Sept. 21—Milwaukee distributors and dealers look for a sharp accentuation of recent improvement in sales as the result of the general price reductions announced by manufacturers, placing most list prices at or below pre-war figures. Discussing the situation, Tom C. McMillan, head of the Overland Wisconsin Co. and president of the Milwaukee Automotive Dealers Assn., said:

"The whole situation rested with the public, which refused to buy anything except of absolute necessity because of high prices. Manufacturers have long realized this situation and governed themselves accordingly. As the result our industry is resuming a healthy era. It took more than a year to bring it about.

"It is my opinion that where interests have held back from price reductions they will soon be convinced that the buying public has a consistent unwillingness to buy anything except at prices which they think are right. In the automotive industries 'rock bottom' prices have restored buying confidence. A generous increase in sales of Milwaukee dealers in the last two weeks proves this to be true."

## Obenberger Forge Will Go On Under Receiver

MILWAUKEE, WIS., Sept. 21—The John Obenberger Forge Co., of Milwaukee, which is going through the bankruptcy courts, will continue to operate as a going concern under the direction of J. Frank Gerdis, trustee, until Oct. 31, according to an order issued by the referee in bankruptcy. The plant was re-opened June 12 on a three months' permit, and creditor banks advanced additional funds to finance production.

At the expiration of the term, Trustee Gerdis requested authority to continue operations until Jan. 12, stating that it would be "disastrous to the interest of the creditors" if the plant was closed now. No new financing is required. The referee, however, granted permission to operate until the close of October, stating that consideration would then be given the matter of future conduct of the company, particularly whether it will continue to operate.

## Division of Tests Plans Experiments

First Will Study Widening of Bituminous Surfaces Caused by Truck Traffic

WASHINGTON, Sept. 17—The Division of Tests of the Bureau of Public Roads has under way a number of new investigations at its experimental station at Arlington, Va. One investigation is the study of the shoving or waving of bituminous surfaces caused by truck traffic.

A circular 15-ft. roadway on a 90-ft. radius is being built. The roadway will be composed of a number of sections of various kinds of bituminous pavement. A driverless truck will be guided by a mechanical arrangement in a varying path so as to cover all parts of the surface in the course of its successive trips around the roadway. A study will be made of the resulting effect on the sections of paving.

Another investigation will be made to determine the distribution of pressure through a slab to the subgrade when a load is applied to the surface. Soil pressure cells are being used in experiments with slabs of different thickness and various subgrade materials. At the same time an opportunity is afforded to compare rock fills with concrete slabs. A report is expected about the end of the year.

In connection with experiments to determine the effect of impact on various types of paving, 120 new slabs are being constructed. An investigation has been started to determine the warping effect of weather conditions, mainly temperature, on concrete slabs. Slabs are being placed to study the effect of slab vibration on the capillary movement of moisture in the subgrade.

An autographic strain gage which will probably be known as a strainoscope, has been developed to use in connection with the determination of stresses in bridges and other framed structures subjected to impact. The first instrument has been tried out and found satisfactory. It gives a photographic record of the change in length of any member it is attached to and there seems to be no practical limit to its accuracy. Its special advantage is that it will record the effect of any blow, no matter how quickly it may be delivered.

## FEDERAL LABOR REPORT

WASHINGTON, Sept. 19—While there was a slight increase in production of motor vehicles in August as compared with July, the number of workers in 47 automobile factories which report to the Department of Labor, declined from 78,908 in July to 74,283 in August. The pay rolls for these plants fell from \$2,620,015 to \$2,522,602. Per capita earnings for the workers in August increased 2.3 per cent.

## G. M. C. Export Models to Be Made in Canada

**Includes All Lines With Exception of Cadillac and Truck— Adds Efficiency**

NEW YORK, Sept. 19—Manufacture of all export models, with the exception of the Cadillac car and the General Motors truck, will be concentrated by the General Motors Corp. at its Canadian plant at Oshawa, Ontario. It is stated that concentration of such production at a single point will place one executive in charge of all export production, with a better realization of export needs. Its purpose is to produce a line of cars more reliable and more thoroughly tested, which for these reasons will be better fitted for foreign trade. Another purpose is to give greater flexibility to the manufacture of such cars, not only because of changes in the manufacturing program but because of details necessary to meet export needs.

### Changes in Personnel

In connection with the concentration of foreign trade manufacturing in Canada, Paul Fitzpatrick, who is now vice-president in charge of operations for the General Motors Export Co., will be transferred from that organization and made assistant to Alfred P. Sloan, Jr., with duties pertaining to the transfer of operations to Oshawa and the study of all problems incident to them.

P. S. Steenstrup, vice-president in charge of sales, will exercise full authority in the export organization, subject to the president, and all personnel heretofore reporting to Fitzpatrick will report to Steenstrup.

### Employees Get Notice

A notice sent to all employees of the export company, says:

"In order to make still more effective the operations of the export company, it is desirable to place all functions in one place, and it is believed that all sales work should be as closely adjacent to factory operation as possible. Such a method of procedure eliminates the organization necessary to maintain contact between two offices located at a distance and enables direct dealing and quicker results and, therefore, better service to our customers. For that reason it is considered desirable to remove the export selling organization, as an organization, to Oshawa at the earliest possible moment. It is recognized in carrying out this program that there will be some functions of the export work which it may not be possible to locate in Oshawa. It is impossible in this statement to determine what functions will remain in New York and what will not. Every effort will be made to concentrate all functions in Oshawa that it is possible to concentrate at that point for the very good reason that as long as the move is to be made everything should be in the one place.

"It is recognized that the above change of program is of vital interest, both personally and otherwise, to the various members of the export organization. The management recognizes this and will be very glad to do the best it can at all times to advise the members of the export organization as to how this change of program will affect his or her status. There must be full appreciation on the part of the organization, however, of the fact that these plans are not fully matured in detail, and this early notice is given in order that as little inconvenience as possible may be incurred on the part of the organization in connection with this future program."

## Hoover Will Address N. I. V. A. Annual Meeting

CHICAGO, Sept. 19—Several men of national prominence will address the annual meeting of the National Implement and Vehicle Assn., which will be held at the Congress Hotel here Oct. 12 to 14. The speakers will include Secretary of Commerce Hoover, Secretary of Agriculture Wallace, W. P. G. Harding, governor of the Federal Reserve Board; James R. Howard, president of the American Farm Bureau Federation, and W. W. Atterbury, vice-president of the Pennsylvania Railroad. The vital problems facing business generally and the farm equipment industry in particular will be considered. C. S. Brantingham of the Emerson-Brantingham Co. will speak on "Can Farm Machinery Business Methods Be Better Controlled."

## Belsize Motors Defers Payment of Dividend

LONDON, Sept. 6 (*By Mail*)—The Belsize Motor Co. of Manchester, one of the best managed and most enterprising plants in Great Britain, has decided to defer payment of a dividend on its preferred stock although the earnings have been sufficient to more than cover the amount needed. An interim dividend of 4 per cent was paid in May and it had been intended to declare another payment for the half year ending this month, but it was deemed wiser to husband resources.

The company has been in production since 1912 on a light model which sold for \$900 complete, and it has enjoyed a much better business than most of its rivals. A new light car will be produced next season with a two cylinder diagonal oil and air cooled engine as well as other more or less novel features designed by Granville Bradshaw.

### TAX RECEIPTS ANNOUNCED

OLYMPIA, WASH., Sept. 21—Completion of the first monthly report of receipts by the State from the liquid fuel tax, or so-called gasoline tax, which became effective July 1, was announced this week by the department of licenses, showing 8,628,192.7 gal. of liquid fuel sold during the month.

## Ten More States Add Gas Tax to Revenues

**Returns in Fourteen States Will Add at Least \$6,000,000, Report Says**

NEW YORK, Sept. 19—Ten new States, bringing the total to 14, added taxes on gasoline consumption to their revenues at the 1921 sessions of their legislature. A report on this subject, compiled by Harry Meixell, secretary of the Motor Vehicle Conference Committee, shows that this action will add at least \$6,000,000 to the taxes paid by motor vehicle users.

When the present year began, the four States which had a gasoline tax were Colorado, Kentucky, New Mexico and Oregon. The States which added the tax this year were Arizona, Arkansas, Connecticut, Florida, Georgia, Montana, North Carolina, Pennsylvania, South Dakota and Washington. The tax is one cent a gallon in all States except New Mexico where it is two cents.

The chief objection to the imposition of a gasoline tax is that it is discriminatory and adds another impost to the "stigma taxes" which have been inflicted on the industry. The tax also discriminates against motor vehicles propelled by internal combustion engines in favor of those driven by steam or electricity. It is probable that agitation over a gasoline tax will be taken up in several other states at the coming sessions of their legislature.

## Indiana Truck Owners Caught in License Net

INDIANAPOLIS, IND., Sept. 21—Following a ruling in court here recently in which the Indiana motor vehicle law was held constitutional, the prosecutor of Marion County is demanding that 200 defendants failing to obtain State license for trucks be adjudged guilty. He says that about 200 truck owners who did not take out State truck licenses were awaiting the outcome of the recent decision.

William P. Frye, the defendant in the test case, is the proprietor of the William P. Frye Transfer Co., and at the time he was ruled against he was given thirty days in which to file an appeal. Several days in which to perfect an appeal have passed, but it has not been filed. The county prosecutor is demanding action on the 200 other defendants.

### BRITISH PIONEER DIES

LONDON, Sept. 5 (*By Mail*)—C. Vernon Pugh, managing director of the Rudge Whitworth Co., Coventry, and also director of the Lanchester Motor Car Co., Birmingham, and the Rudge Whitworth Wire Wheel Co., died unexpectedly last week while on a brief holiday. Pugh was the foremost advocate in Britain of the wire wheel for cars.

## Metropolitan S.A.E. Discusses Fuel

### Papers Read at Summer Meeting of Society Are Reviewed

NEW YORK, Sept. 21—A review of the fuel paper read at the Society of Automotive Engineers' summer meeting was presented by H. L. Horning at the first meeting of the Metropolitan Section held this season at the Automobile Club of America.

Horning passed by the Dorris manifold paper with the remark that Dorris in the device described by him had produced a remarkable piece of apparatus. He had driven a Dorris car fitted with it on and knew that it gave excellent results. He then turned to the paper of Dr. James and commended it highly. He drew attention to the fact that the loss in the gear box and rear axle due to the use of heavy lubricants is surprisingly high, as one will find by filling the transmission case and axle with heavy lubricants and noting how sluggish the car is in coasting. We should not, he said, overlook the advantage of the soft cord tire, for such tires may add 15 per cent to the mileage of the car.

#### Air Cycle Efficiency

The term air cycle efficiency was discussed and its values for different compression ratios were given. It was explained that this is an ideal efficiency and is never obtained in practice, one reason being that the specific heats of the gases of combustion increased at high temperatures, causing a loss of about 15 per cent, and another that at high temperatures there is a loss of about 13.5 per cent due to direct radiation. There is also a loss of about 1 per cent due to the fact that the gases do not burn instantaneously but have to be ignited a moment before reaching the dead center and kept on burning for some time after the piston starts on the down stroke, so that the pressure in the combustion chamber does not reach the full value that might otherwise be expected. There is a further loss of about 2 per cent due to the lead given to the exhaust valve opening.

This leaves 68.5 per cent, which is approximately the relative efficiency obtained in a good engine. The relative efficiency had a tendency to go up with the compression ratio, displacement, rotational speed and load. The volumetric efficiency is affected by the inlet temperature, design of passages, character of fuel and the timing.

#### Crane Opens Discussion

H. M. Crane, who opened the discussion, said that he has recently been using the overhead valve type of engine because the compression chamber of such an engine is easiest to machine and easiest to clean. He has found, however, that, owing to the absence of turbulence

in the flat cylindrical combustion chamber, it is necessary to give the ignition an advance of 65 deg. in order to obtain the maximum power, but by the use of two-point ignition it has been found possible to reduce the required ignition advance to 35 deg. There is also much trouble at idling speeds. In fact, on very small throttle openings the engine in question could be kept running only by using two-point ignition or by increasing the richness of the mixture from 15 to 20 per cent. On the other hand, the combustion chamber forming substantially an extension of the cylinder bore, has less flame-swept area, and a higher compression ratio can be used. Two point ignition also results in much better pick-up of the engine. By providing four spark plug bosses per cylinder and trying the plugs in various positions it was possible to find the best locations.

#### Depends on Cylinder

Crane said that in his engine he depends largely upon the cylinder for the vaporization of the fuel, as in the cylinder all the factors required for this process—the area, the temperature and the time—are present. This latter statement was taken exception to by W. P. Deppe, who said that in order to insure homogeneity of the gaseous charge in the combustion chamber, vaporization of the fuel must take place before the fuel entered the cylinder.

## S. A. E. Members to Make Trip to Proving Grounds

NEW YORK, Sept. 17—Arrangements have been completed for the trip of members of the S. A. E. to the Aberdeen Proving Grounds on Oct. 7, and an announcement concerning it was made at the Metropolitan Section meeting on Thursday last. A B. & O. train will leave the Pennsylvania depot in New York at midnight and will arrive at Aberdeen about 9 o'clock next morning. The use of a motor omnibus had been offered to the society for the use of members who might wish to go by road. The plan was to leave S. A. E. headquarters about 10 o'clock in the morning on the 6th and make the entire trip down to Aberdeen, as well as the return journey, by bus. However, since this would take three business days instead of one, there did not seem to be much interest in the proposition, and it was dropped. An alternative plan is to go down to Wilmington in the afternoon or evening of the 6th and stay there over night.

#### CHINA PLANS FIRST SHOW

SHANGHAI, CHINA, Aug. 31 (*By Mail*)—China's first automobile show will be held in Shanghai in November. The show will become an annual event and great preparations have been in progress to make it one of the most striking demonstrations the Republic has known. The good roads movement in China is actively supporting the show.

## Ford Business Good in Des Moines Field

### One Dealer Reports August Biggest Month—Accessory Sales Fall Off

DES MOINES, IOWA, Sept. 21—The Herring Motor Co., long established Ford dealers, report that the month of August, in so far as car sales was concerned, was the largest that company has ever known. Another Ford dealer reports sales of 144 cars in Des Moines during the month.

Other dealers, while they report business has held up to a point even with or above the expectations, admit that many of them will do well if they "stick it out" through the winter.

The unusual Ford business referred to cannot be entirely attributed to price cut stimulation, as the last Ford cut did not come until late in August. Ford business seems to be better in Des Moines than it is in some other cities in Iowa, and this may be accounted for partially by the fact that Des Moines has been without street car service since Aug. 3. It is also admitted by dealers that many prospective buyers who in normal times would buy higher priced cars want transportation, and are therefore buying Fords.

#### Business Stimulated

There is little question but that price cuts have served to stimulate business among all dealers. A dealer who sells one of the higher priced cars advised the writer that prospects for a fairly good enclosed car business during the fall were good.

There is no improvement in the condition of the business among farmers, and dealers do not anticipate any until freight rates come down and the retailer takes a greater portion of his losses.

C. L. Herring of the Herring Motor Co. stated that the accessory business during the past sixty days had not held up to the car business. Repairmen and garagemen report the biggest business in their history, which is taken to mean that car owners are making major repairs with the idea of making cars go the full limit.

#### ELECTRIC TRUCKS AT SHOW

NEW YORK, Sept. 19—Displays of electric trucks will feature the electrical show which will be held at the 71st Regiment Armory beginning Sept. 28. Figures compiled by the managers of the exposition show that nearly 800 electrically driven trucks have been sold in the boroughs of Manhattan and Bronx in the last three years. The total in operation in the two boroughs at the beginning of the year was 3142, and there were 4362 in the metropolitan district which had been in operation for a year or more. Wholesale and retail bakers lead in the number of trucks operated with 485.

## Depression Holds Up Trade in Far East

### Returned Paige Representative Says General Business Must First Pick Up

DETROIT, Sept. 16—Revival of automotive business in Australia and the Far East is dependent entirely upon the revival of general business in that part of the world, and revival of general business there means a renewal of its commercial intercourse with the United States and the great industrial nations of the world.

To Alfred B. Peacock, representative of the Paige Motor Car Co. in that territory, there can only be prosperity in those countries of limited sources of wealth when the rest of the world resumes its normal stride. With a demand for their products, these countries will be in a position to buy not only automobiles but all sorts of merchandise. Without an opportunity to sell they will not be able to buy.

#### Brings Home Report

Peacock is back in the United States after a prolonged absence in these countries, to study new automotive ideas for adaptation there. He is optimistic of the possibilities for business in those countries after reviewing conditions intimately here, and looks for a steadily increasing business after the first of the year.

There should be good business in the Antipodes and the Far East, he declared, for American cars ranging up to what is the middle priced car class here. For trucks and tractors, the Australian market is limited, owing to the excellence of the draught horses bred in that country and owing to the high operating costs of motor driven vehicles, as compared to the low costs of keeping horses.

American passenger cars have a good hold upon the regard of Australian car buyers, owing to low operating costs and fuel economies, though there are a number of British and Italian cars of low horsepower in use in the cities. As a general rule, however, Peacock said, the more powerful and more economical American car finds great favor.

#### Fuel Costs High

Fuel costs are extremely high in Australia, there being no production of oil on the continent itself, and the fields of Borneo and the Dutch East Indies being several weeks away by steamer. Explorations for oil are now under way in many parts of the continent, but as yet there have been no strikes in quantities to warrant commercial exploitation.

Servicing of cars is about on a par with service in the United States, manufacturers requiring that ample stocks be carried to insure owners continuous use. Dealers maintain adequate stations, and most of the farmer owners are mechanics enough to make repairs and parts replacements as required.

Manufacture of parts for cars is carried on to a considerable extent in Australian machine shops. There are also a number of tire producers who are finding much favor with local buyers. Two makes of cars are being assembled in Australia entirely of American units, both of these being just introduced and finding favor because of the desire to promulgate home industries.

Body manufacture is carried on to a high degree of perfection throughout the entire territory, Peacock asserted. Japanese body makers and Australian artisans vie with the best of American builders in this work. Japan is an especially good market for enclosed body sales, owing to the severe winters and dusty summers. In India there is much custom built body work, but in India's case, only the finishing touches are given the work by native artisans, the body building being done by the car maker before shipping.

## Cord Tire Is Becoming More Popular Abroad

WASHINGTON, Sept. 19—Statistics furnished the Bureau of Foreign and Domestic Commerce by R. L. Palmerton, chief of the rubber division, show that the cord tire is becoming increasingly popular with European owners. According to the reports of 63 tire manufacturers there were exported in this country during July, 48,840 automobile casings and 46,322 inner tubes.

Palmerton says that in the larger and straight-side sizes the popularity of the cord tire has increased until its sales surpass those of the fabric, while in the small sizes and clincher type the fabric tire is still supreme. It is also interesting to note that there were exported during the month four clincher cord tires, size 37 by 5; four clincher fabric tires, size 32 by 4; four clincher fabric tires, size 33 by 4; and two clincher fabric tires, size 33 by 4½.

Of the 48,880 casings, representing all sizes, types, and constructions, 10,469 casings, or 21.4 per cent, were of the inch-size cord construction; 24,652, or 50.4 per cent, were of the inch-size fabric construction; and 13,759, or 28.2 per cent, were in clincher-type millimeter sizes, this latter class not divided as to cord and fabric. The principal interest to be found in the figures is the disclosure of the export demand as to sizes.

#### THOMAS GETS SPEED RECORD

PARIS, Sept. 19 (*By Cable*)—An average speed of 72 miles an hour was made by Rene Thomas driving a Talbot-Darracq in winning the race at LeMans for cars equipped with engines not exceeding 91 cu. in. piston displacement. This speed established a new world's record for cars of that class. Guinness was second in the race and Segrave third, both driving Talbot-Darracqs.

The race for cycle cars with engines of 67 cu. in. piston displacement was won by Lombard with a four-cylinder Salmson, who averaged 54.7 miles.

## Automotive Trade Leads Retail Line

### Ohio Bankers Say It Is in Better Shape Than Any Other Due to Prices

CLEVELAND, Sept. 20—The retail automobile business here is in better shape than is any other retail line, according to expressions heard at the annual meeting of Group 9 of the American Bankers Assn., which was held last week at Chippewa Falls.

Bankers throughout the northern tier of Ohio counties attended the gathering, and all practically reported that the retail automobile dealer was giving less trouble with financing demands than the other lines of merchandising. Trade is brisker with automobile dealers than it is with the average retail merchant in other lines, according to reports from this city, Akron, Ashtabula, Sandusky and Lorain.

#### Price Reductions a Favorable Factor

The large reductions that were made in the prices of all makes of cars were said to be responsible largely for the condition in the trade and credit also was given for smart advertising and keen merchandising methods. Bankers were urged to do what they can to continue reductions in the prices for material and labor, and also to encourage buying. This appeal was made by H. K. Ferguson, of the H. K. Ferguson Co. of this city. F. C. VanCleaf, of the B. F. Goodrich Co., Akron, said that while the rubber industry has experienced its share of trouble, yet it has not gone through an experience more trying than has the average industry. Tire sales the first seven months of the present year were an annual 5,000,000 unit basis as compared to 33,000,000 units in 1920. On July 31, the industry had less than one and a half months' supply on hand, while consumption was going on undiminished. Railroads have been light purchasers of belts and hose and the mechanical goods department has been very quiet. The rubber boot and shoe business is prepared for a severe winter following the mild one of last year.

In the steel industry, W. E. Manning of the Youngstown Sheet & Tube Co. said that production reached its low ebb last July and that since then there has been a slight increase on account of buying to meet actual needs.

#### RECEIVER FOR HINKLEY

DETROIT, Sept. 22—An involuntary petition in bankruptcy has been filed by creditors against the Hinkley Motors Corp., and the Security Trust Co. has been appointed receiver. Acts of bankruptcy are alleged in the payment of several creditors' claims while insolvent. The liabilities are said to total approximately \$1,500,000 while the fixed assets amount to less than \$1,000,000. The company has many unfilled orders on its books.

## Back to Normal Plan Offered by Reeves

N. A. C. C. Official Suggests "Re-adjustment Week" Followed by a "Buying Week"

NEW YORK, Sept. 19—Contributing to a symposium in which the views of representatives of various industries are given, a novel proposal for hastening the return of business to normal is made by Alfred Reeves, general manager of the National Automobile Chamber of Commerce.

"People must be convinced that prices have been stabilized," says Reeves. "Why could not we have a great 'readjustment week' when everyone would readjust prices, to be followed by a great 'buying week' that would tend to speed up the wheels of commerce?"

"The Administration at Washington is, I believe, doing everything possible to bring about these readjustments in orderly fashion. You cannot legislate yourself into heaven, however, and the country's situation was so bad that even so great a leadership and so great an array of men as we have at Washington at the present time cannot bring the readjustment except at a slow and orderly rate.

"Let us have faith in our Washington officials until they prove unworthy.

"Let us take a greater interest in our local municipal affairs, where much trouble is brewing because of extravagances.

"Let us have that abiding faith in the future of America that has always been the keystone of our progress, and, above all, let us work."

Referring to taxation, Reeves says:

"Instead of looking for new sources of revenue, there is a general feeling that we should find new sources of economy."

On the subject of tariff, his view, which is that of the automotive industry, is:

"Let us have a tariff that will produce a fair revenue, but not one that will simply place the burden of the increase on the American public. This country with great productive capacity needs trade. We must expect to buy from foreign countries if we plan to sell to them."

## Corn Prices Expected to Aid Fall Business

DECATUR, ILL., Sept. 21—Better corn prices will mean 100 per cent increase in the automobile business, according to one Decatur dealer, who added that he had four prospects on his list ready to buy when corn hits 50 cents.

Dealers throughout this territory agree that prospects for winter business are bright. "We have learned that we must earn every order we get," explained another, "but people are buying once more. Never have we had such a bunch of live prospects."

A third summed up the outlook: "Cars are fairly easy to get and we can handle all the business coming in. As might be expected, sedans are most popular jobs now and the person ready to buy a car can usually get the difference between an open car and a closed one."

## UNEMPLOYMENT CONFERENCE WILL INCLUDE ONLY ONE AUTOMOTIVE MAN

WASHINGTON, Sept. 19—Only one man directly connected with the automobile industry has been selected by the President as a member of the unemployment conference which will be held here beginning Monday next. James Couzens, mayor of Detroit and vice-president of the Ford Motor Car Co., has been named as a representative of the city and of the automobile industry. An effort will be made by the automobile trade and highway officials to show that the resumption of highway construction would alleviate unemployment conditions and at the same time improve the transportation facilities of the United States. It is hoped that Couzens and others interested in the automobile industry will keep this subject before the conference.

## Passenger Car Sales Show Drop in New York

NEW YORK, Sept. 21—New passenger cars numbering 4566 were sold in August in 10 counties in and around New York, as compared to 5843 in July. The August sales included 4216 in the class approximately below \$2,500 and 350 in the class above that price. For the eight months ending Sept. 1, the total registrations were 34,991.

Registrations, equivalent to sales, in the 10 counties, month by month throughout the year, were:

	Approximately below \$2,500	Approximately above \$2,500	Total
January .....	483	146	629
February .....	1,409	210	1,619
March .....	3,396	488	3,884
April .....	4,811	575	5,382
May .....	5,468	584	6,052
June .....	6,522	490	7,012
July .....	5,457	386	5,843
August .....	4,216	350	4,566

(The registrations compiled by Sherlock and Arnold of New York cover all of New York City and five counties outside).

## Moreland Truck Resumes on Limited Schedule

SAN FRANCISCO, CAL., Sept. 21—The Moreland Motor Truck Co. has resumed manufacturing on a limited schedule at its plant here, which has been closed for some weeks. This plant was one of the last of the truck manufacturing plants of the country to suspend and is one of the first to resume. The stock of trucks completed when the factory suspended has been practically sold out, and manufacture will be held at the amount of sales for some time to come, according to Watt L. Moreland, vice-president and general manager of the company.

## Resignations Do Not Affect Hares Motors

Company Will Continue to Offer to Trade Complete Line of Trucks

NEW YORK, Sept. 20—Although Emlin S. Hare has resigned as president of the Kelly-Springfield Motor Truck Co., and the other representatives of Hares Motors who were officers of the truck company have resigned, the two corporations have renewed their relations in the sales field and Hares Motors will continue to offer a complete line of trucks ranging from 1½ tons to 6 tons capacity, with a wide selection of wheel bases, frame lengths and gear ratios. Charles Willard Young of Emerson McMillin Co. has been elected president of the truck company to succeed Hare.

Edward O. McDonnell of this city, who has been appointed general manager of the Kelly-Springfield plant at Springfield, Ohio, is a graduate of Annapolis and during the World War served as personal representative of Admiral Sims in procuring the material and personnel for the North Sea mine laying project which involved an expenditure of \$40,000,000 for material.

A statement by Hares Motors in reference to its future plans, states that abrogation of the Locomobile and Mercer contracts will not interfere in any way with its original plans, which call for the production and marketing of passenger cars to sell for \$1,700, \$2,500 and \$4,500.

Hares Motors of New England has taken over the distribution of the Saxon car, but no arrangements have been made for handling this line in other sections of the country.

## Heavy Registrations Expected in Columbus

COLUMBUS, OHIO, Sept. 21—Stimulated by the general reduction in prices and also by the Atwood law, which requires the registration of bills of sale on all used cars, when ownership is changed, registration with the Ohio Automobile Department so far this year has been far in excess of the totals for 1920.

Up to Sept. 15 of this year the department registered in excess of 604,000 gasoline passenger cars, 4000 electrics, 97,000 trucks and 3700 dealers and manufacturers. The total registration in the various classifications in 1920 were: Gasoline passenger cars, 533,000; electrics, 4000; trucks, 83,000; dealers and manufacturers, 3700. Thus there is a big increase in the number of gasoline passenger cars and in trucks.

It is predicted by Registrar W. A. Snow that there will be about 617,000 gasoline passenger cars registered in 1921.

## Receivers Appointed for Accessories Firm

### Assets of Former Times Square Auto Supply Co. in Excess of Liabilities

NEW YORK, Sept. 21—D. W. Kahn, of 120 Broadway, Robert B. Baird and A. J. Cohen have been appointed receivers under a bond of \$50,000 by United States Judge Charles M. Hough for the Consolidated Distributors, Inc., in an equity proceeding.

The company operates 39 different stores for the distribution of automobile accessories and has its main office in Long Island City. The petition was filed by Chester D. Ireland, of Ridgewood, N. J., who alleges claims of \$24,000. The petition states that liabilities approximate \$2,500,000 with assets in the neighborhood of \$3,500,000.

At its incorporation, the Consolidated Distributors, Inc., acquired the business of the Times Square Automobile Co. of New York, Pennsylvania and Missouri. It has an authorized capital of 300,000 shares of common without par value, and for the year ended Dec. 31, last, its net sales aggregated approximately \$5,456,000. Its balance sheet as of Dec. 31, last, showed inventories of \$4,178,000 and notes and accounts payable of approximately \$1,828,000.

Consolidated Distributors was incorporated in New York in September, 1916, as the Times Square Auto Supply Co. and the present name was adopted in March of this year. Included among the companies it took over was the Times Square Automobile Co. of New York, a Missouri corporation which in March of 1916 acquired the automobile supply and accessory business of Froelich, Mansbach & Froelich, which was engaged in the wholesale and retail distribution of accessories. When the name was changed this year the company separated its wholesale from its retail business. The wholesale business for the Eastern States is located in Long Island City, where the company has a plant. There also are wholesale plants in Los Angeles and San Francisco.

The Times Square Auto Supply Co. of New Jersey conducts the retail business. Stores are located in New York, Philadelphia, Pittsburgh, Chicago, Minneapolis, Kansas City, Cincinnati, Columbus, Des Moines, Milwaukee, San Francisco, Brooklyn, Baltimore and Yonkers. The New York salesrooms are located in three steel and concrete buildings erected by the company at Broadway and 56th Street on land leased for 21 years with option for renewal for 21 years.

The Consolidated Distributors has an authorized common stock capital of 300,000 shares of no par value of which 190,396 shares are outstanding. An issue of 7 per cent cumulative preferred stock previously outstanding was redeemed in July, 1920. Dividends on the preferred were paid regularly until it was re-

deemed. Dividends on the common began in April, 1920, and were paid regularly until April of 1921, when the dividend was passed, although the dividend paid Jan. 27 of this year was in scrip.

The general balance sheet as of Dec. 31, 1920, showed assets of \$6,628,347. The working capital at that time included: Cash, \$211,010; notes receivable, \$17,211; accounts receivable, \$861,485; inventories, \$4,178,605. Notes payable were listed at \$1,577,880 and accounts payable at \$250,871.

William H. Durval of this city is chairman of the board and Jesse Froelich is president. The directors, besides these two, are H. A. Weatherbee, C. D. Ireland, C. Stanley Mitchell, G. A. Graham, Darwin A. James and O. R. McDonald of New York and Will A. Innes of Los Angeles.

### BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, Sept. 21—The trend of the money market was toward still easier money last week, while renewal rates for call money stood around 5 per cent new loans were made at as low as 4½ per cent. Time money was offered at 5 per cent for 30-day maturities, with a nominal quotation of 5½ per cent for 30-, 60- and 90-day maturities, while 4, 5 and 6 months' maturities were quoted at 5½ per cent against a range of 5½ to 6 per cent the previous week. These quotations were surprising in view of the large mid-month financial operations of the Treasury. The commercial paper market was quite featureless with rates of 6 per cent for prime bills and 6½ per cent for secondary names for all maturities up to six months.

"The New York Reserve Bank announced a reduction in its rediscount rate from 5½ per cent to 5 per cent on Sept. 21."

The large amount of money seeking highly liquid investment was evidenced by the subscription of \$1,587,838,900 to the recent Treasury offering of about \$600,000,000 combined of 3-year 5½ per cent notes, 1-year 5½ per cent certificates of indebtedness, and 6 months' 5 per cent certificates. \$698,149,100 were allotted, leaving \$889,689,800 which did not secure investment. The offerings and allotments were as follows: To the 3-year 5½ per cent notes \$785,082,900 were subscribed and \$390,706,100 allotted; to the 1-year 5½ per cent certificates of indebtedness \$339,938,000 were subscribed and \$124,572,000 allotted; to the 6 months' 5 per cent certificates \$462,818,000 were subscribed and \$182,871,000 allotted. By offering current interest rates and an easy method of subscription, the Treasury has built up an excellent market for its floating and short-term debt, with a result that Secretary Mellon's plan for spreading the nearby maturities of Government obligations over the period ending in 1928, is making rapid progress.

## Motor Wheel Plans Merging of Units

### Push Arrangements for New Building—Company Expects to Extend Operations

DETROIT, Sept. 21—The Motor Wheel Corp. at Lansing will push forward at once new building plans which will permit consolidation of units and place the company in a position to extend its operations. Although business for the next few months is expected to slow down somewhat, officials are convinced that a revival is inevitable with the turn of the year.

In addition to the operations at Lansing, the company will erect several new buildings and increase its railroad facilities at the woodworking plants in Memphis. The original plans of the company had fixed the new construction and consolidation programs for 1922, but the addition of new business in the past 60 days, coupled with the desire to provide assistance in employing men during the fall and winter, prompted the decision to proceed with this work at once.

Among the construction details are a new rim plant to take care of contemplated increase requiring additional steel rim and steel felloe output. This will be in operation before the first of the year. The hub shops of Prudden and automobile wheel plants will be consolidated into a modern hub machine shop of greatly increased capacity. The main office of the company at the Prudden factory will be doubled in size and all the Lansing offices will be consolidated there.

## Durant to Use Ansted Engines in New "Six"

NEW YORK, Sept. 20—Announcement is made by Durant Motors, Inc., that the Ansted motor, manufactured by the Ansted Engineering Co. of Connersville, Ind., has been adopted for use in the Durant six cylinder car, formerly the Sheridan, which will be placed on the market about Nov. 1. A contract has been placed for the manufacture of a large number of these motors.

Although the Ansted Engineering Co. is controlled by the United States Automotive Corp., which also is the holding company for the Lexington Motor Co., the Connersville Foundry Corp. and the Teetor-Hartley Motor Corp., it is stated at Durant headquarters that no significance was to be attached to the use of the Ansted motor in the Durant car beyond the belief by Durant that it is the best motor of its kind available. The motor designed by Durant engineers for use in his four cylinder car will continue to be made by the Continental Motors Corp. Experimental work on the redesigned Sheridan, which will be transformed into the Durant Six, is still under way at the Long Island City plant.

# Unit Parts Makers Revising Prices

## Want to Cut Cost of Assembled Vehicles

Believe Reductions Will Stabilize Car and Truck Sales and Equalize Competition

DETROIT, Sept. 20—Important price revisions by some of the leading unit parts makers, announced to the industry in the past week and effective almost immediately, are expected to place the assembled car and truck business upon the firmest price foundation that it has known since 1917.

In the opinion of the unit makers, their concessions will be followed at once by reductions in the prices of assembled cars and trucks, and the prices so announced will be stabilized for a long time to come. Car and truck makers whose present prices have anticipated the new concessions, will show a smaller reduction than in the case of products which have awaited definite action by the parts makers, but it is regarded as certain that there will be general revisions all along the line.

There is a feeling that the reductions in the assembled products will bring, at least temporarily, an era of competition between the all-factory built and the assembled product, which will bring the industry as a whole immediately to a point where hesitancy in buying on the part of the public will be eradicated as a factor in withholding business.

In announcing the price revisions to the trade, the parts makers are doing so with the knowledge that comparison with the basis of prices in 1917 will show not only that they have again reached that level, but in many instances are actually below them. In return, the revision of prices by the assemblers is expected to show the buying public a similar favorable comparison, and restore buying confidence.

In fixing their new price schedules, the parts makers have based them entirely upon present day material and labor prices, and a production cost determined as accurately as possible on business which the reductions should bring about. The new prices will mean further heavy inventory losses, but these will be taken as necessary to restore confidence to the buying public.

It has been taken for granted that a considerable time must elapse before sufficient business will have resulted to compensate for the inventory losses. Getting past this time will be the period of greatest trial for the industry. With it safely passed, a firm business footing will have been established, and that is the aim of the movement.

## Exports of Automobiles, Airplanes, Trucks, Farm Tractors, Motorcycles and Parts for August and Seven Previous Months

	Month of August				8 Months Ending August			
	1920		1921		1920		1921

## Automotive Exports Show Slight Gains

### Increases Shown in Passenger and Commercial Cars and Airplane Parts

WASHINGTON, Sept. 20—Statistics of automotive exports for August, compiled by the Bureau of Foreign and Domestic Commerce to-day, show a slight increase in the value of passenger and commercial cars and airplane parts, as compared with the previous month. This gain is more than offset, however, by declines in other automotive commodities offered for export. The figures show that exports of automotive products were from two to eight times greater during August, 1920, than for the same period this year. A smaller ratio obtains on the total exports for the eight months ending in August.

Though the number of trucks has declined 18, the value of commercial cars exported during August was \$119,815 greater than the previous month. Exports of passenger cars increased by only 14 during August, but the value exceeded that for July by \$381,960. The notable increase was in the value of airplane parts, the gain amounting to \$12,561 for August, 1921, as compared with the previous month.

Shipment of parts, not including engines and tires, fell off approximately \$200,000 during August. Compared with August, 1920, the decline amounted

to \$4,329,059, and the value for the eight months' period ending August, 1921, was about half the amount for the same period last year.

There has been a marked decline in the volume of tractor engines exported, as the shipments for August of this year amounted to two, as compared with 1497 engines valued at \$1,122,940, for August, 1920. The number of gasoline engines exported during August, 1920, amounted to 834, with a value of \$220,670, as against 6227 engines and a value of \$2,124,529 for the same month last year.

## Lincoln Business Better Than Any Previous Month

DETROIT, Sept. 22—President H. M. Leland of the Lincoln Motor Car Co. told his dealers who had assembled here this week for a sales conference, that the company had definitely turned the corner and that its business now was at a higher mark than at any time heretofore. He predicted that general business conditions would brighten in the near future.

R. C. Getsing, general sales manager, said that September business was running far ahead of any previous month. Ninety cars were shipped in the first week, which was a record, and it is expected the total for the month will reach 400. October is expected to exceed September. The company is behind in deliveries of certain models.

An unusual condition reflected in the sales was the growth of business in the South because of increased popularity of the high priced cars in that section.

### General Motors Executives at Detroit Conference

Lower Row: Lawrence P. Fisher and Fred J. Fisher, Fisher Body Co.; G. W. McLaughlin, General Motors of Canada Group, Oshawa, Ontario; K. W. Zimmerschied, Chevrolet Motor Co.; A. P. Sloan, Jr., vice-president; P. S. du Pont, president; J. J. Raskob, vice-president; C. S. Mott, chief of advisory staff, General Motors Corp.; H. H. Rice, president Cadillac Motor Car Co.; J. A. Craig, Samson Tractor Co., Janesville, Wis.; J. H. Newmark, advisory staff

Middle Row: J. H. Beaton, McLaughlin Motor Co.; Ross MacKinnon, General Motors Co. of Canada; J. W. Wheeler, General Motors Export Co.; C. J. Nephier, Oakland Motor Car Co.; H. M. Craig, Samson Tractor Co.; E. M. Young, advisory staff; Norval A. Hawkins, director of sales, advertising and service, advisory staff; L. McNaughton, Cadillac Motor Car Co.; H. T. Hickey, advisory staff; V. H. Day, General Motors Truck Co., Pontiac; L. R. Beardslee, New York office; H. G. Weaver, advisory staff

Top Row: R. B. Kayser, Chevrolet Motor Co.; A. L. Deane, General Motors Acceptance Corp.; L. D. Haas, Scripps-Booth Corp.; J. T. Ardis, New York office; T. S. Merrill, secretary, General Motors Corp.; C. E. McTavish, General Motors of Canada; E. T. Strong, Buick Motor Co., Flint; G. H. Peasley, Olds Motor Works, Lansing; R. D. Kerby, Olds Motor Works of Canada; J. H. Voorhees and F. G. Eastman, advisory staff

## Two G.M.C. Meetings a Month in Detroit

### Executives Will Confer to Perfect Close Contact on General Policies

DETROIT, Sept. 17—To bring the units of the General Motors Corp. into the closest possible contact on general policies, meetings of the executive committee will be held twice monthly at the big G. M. C. Building here, with either President Pierre S. du Pont or one of the executive vice-presidents, presiding.

Attending each of these executive committee meetings will be executives of the particular units whose operations are affected by discussions set for the particular meeting. Executives not attending will be apprised of developments by personal letter and code message. Members of the advisory staff, which operates under the executive committee as the contact point for all units, will attend each meeting.

The operations committee of the corporation, which comprises the manufacturing executives of all units and the executive officers of the corporation, will meet monthly. Complete details of operations, sales and general policies of the many units have been practically definitely worked out at the meetings held to this time and are being made effective at once.

On the occasion of the meetings held here this week a dinner was tendered President du Pont and visiting executives by the advisory staff.

### MUTUAL CREDITORS MEET

SULLIVAN, IND., Sept. 21—A resolution adopted at a meeting of the creditors of the Mutual Truck Co., against which receivership proceedings recently were instituted, indicates that common stock in the corporation may be accepted by creditors in the payment of claims. If the property of the company is disposed of at a forced sale, the creditors will receive less than 10 cents on the dollar.

### SHOW DRAWING OCT. 6

NEW YORK, Sept. 21—The annual members' meeting of the National Automobile Chamber of Commerce, at which space is drawn for the New York and Chicago shows, will be held at headquarters in this city Oct. 6. Prior to the luncheon which will precede the space drawing, Magnus Alexander of the National Industrial Conference Board will address the members. A convention of truck manufacturers represented in the chamber will be held Oct. 7, at which the problems of that branch of the industry will be discussed.

### ROAD APPROPRIATION SOON

WASHINGTON, Sept. 22—No action will be taken on the highway appropriation bill until the House reconvenes on Oct. 4. The House met Wednesday but under a gentlemen's agreement will take three day recesses until October, when it will settle down to business. It is expected that differences between Senate and House bills will be smoothed out without delay because practically all highway construction dependent on Federal funds will be held up until these appropriations are available.

## Wood Wheel Group Latest in M. A. M. A.

### Will Dissolve Old Organization and Members Will Join Larger Association

DETROIT, Sept. 20—The Automotive Wood Wheel Manufacturers Assn. will be dissolved and its membership will be reorganized as the Wood Wheel Group of the Motor and Accessory Manufacturers Assn. following action taken at a convention of the association in Lansing. Plans for consolidating with the M. A. M. A. were made through the co-operation of M. L. Heminway, general manager of the association.

The last annual meeting of the Wood Wheel Assn. will be held in New York during the National Automobile Show week there. At this time the present association will be formally dissolved and its membership will be enrolled in the roster of the accessory association.

A report was read at the convention by Cornelius T. Myers, engineer of the Wood Wheel Assn., on developments in the methods of waterproofing wood. As a result of this report the convention passed resolutions asking Congress that appropriations for continuance of this work by the Government's forest products division be increased.

Standardization work, in which the association has been active since its organization, was brought nearer to realization by discussions at the convention, but definite action was deferred for a later meeting.

## METAL MARKETS

It was to be expected that the change which has come over the sheet market would be misinterpreted in many quarters as an indication of enduring advances in steel prices generally. Such a deduction, however, appears utterly devoid of logic, when the situation is subjected to rational analysis. In fact, the steel market is sailing its course toward readjustment, according to the chart which governs all such economic changes. Every downward curve in commodity values shows here and there a bulge that temporarily halts the trend, but after a brief interval only serves to quicken it. There has been no change in basic conditions to justify a change in the course. The steel industry is still working at a rate that would have been considered unsatisfactory before the war, so that, taking conditions as a whole, the potential supply continues considerably in excess of the actual demand. Such a condition furnishes no support to the view that prices in the steel industry have turned the corner. Of the demand for some steel products, not of the price, it may be said that it has turned the corner, i.e., it has improved from a rate that was insufficient to keep mills in operation even on the lowest production schedule to one that permits of a modest scale of output, although still far from occupying anywhere near total plant capacity. The latter condition prevails in the sheet industry. It was brought about by the incentive to buying furnished by the keen competition that prevailed among rollers up to the middle of the month. When the "independents" cut under the Corporation's sheet prices the chief interest announced it would meet all price cuts and warned some of the smaller producers that they were losing money at the price levels which they were quoting. As the result of the attractive prices offered to consumers, a relatively fair tonnage of sheet orders was placed on producers' books late in August and early in September, and they feel that the momentum of buying has reached a point where they can afford to abrogate the concessions which they made so as to bring their operations up to a point where the overhead would not devour all possible profits. They figure that enough business will now come out without the necessity of coaxing it out with price concessions, to "sugar" the low-price orders they have on their books. In these circumstances it seems hardly to meet the situation to speak of a "\$5 per ton advance in the sheet market." At the present prices of sheets, so inclusive an advance would indeed be spectacular.

**Pig Iron.**—Middle West automotive foundries are buying slightly increased tonnages of malleable. The melt of automotive foundries is reported as on the upgrade. The market has a more settled appearance.

**Steel.**—Cold-finished steel bars are lower as the result of hot-rolled being available at 1.65c. Cold-finished bars are obtainable at as low as 2.30c. with most mills quoting 2.40c. The strip steel market is still unsettled. Some automotive consumers are inquiring for quotations on October deliveries. The general quotation heard for the cold-rolled is 4.25c., Pittsburgh, but every order appears to be a law unto itself according to desirability, and a Cleveland report named as low as 3.50c. being quoted in one instance. The stiffer market for ordinary sheets does not seem to have affected 22 gauge auto body stock, which is quoted at 4.45c. Relatively low prices on full-finished sheets are ascribed to the pressure resulting from the downward revision in the prices of passenger cars.

**Aluminum.**—Somewhat more activity is noted in ingot metal, but prices appear to have been pared to make this change possible. There have been offers of 98 to 99 per cent pure ingots at 18c., duty paid, emanating chiefly from importers who are not regular handlers of aluminum.

**Copper.**—The market is firmer, although there has been no increase in buying by consumers.

**Tin.**—Consumers appear to be covered and speculators have the field to themselves.

**Lead.**—The lead market is fairly steady. Battery interests, however, show only slight interest, most of the buying coming from the paint and pigment industries.

## FINANCIAL NOTES

**Republic Rubber Corp.** receiver's statement as of June 22, last, shows net assets available for the \$6,753,200 of first preferred stock (\$100 par value) equivalent to \$62.08 a share and no equity for \$1,467,900 of second preferred stock (\$100) and 478,000 shares of no par value common stock. The statement takes into consideration only about 10 per cent of the crude rubber and fabric claims against the company aggregating over \$2,000,000. The net worth of the company is given at \$4,192,219. Aggregate acknowledged liabilities are \$2,909,000, of which \$2,237,038 are notes payable. Liquid assets include \$280,404 of cash and \$500,826 of notes and bills receivable. A merchandise inventory of \$1,391,938 brings the aggregate quick assets to \$2,174,169. Plant, property and equipment at the depreciated value are listed at \$4,498,452.

**Long Manufacturing Co.'s** issue of \$300,000 in 8 per cent first mortgage serial gold bonds is now being offered for public sale in Detroit. The bonds are callable at 105 on 60 days' notice after Jan. 1, 1922. Company's plants and equipment are shown as appraised at \$695,717.45 and its quick assets as \$694,681.27. The proceeds of the bond sale are to be used for retirement of current bank loans. Annual business is shown to have averaged over \$2,880,000 for the past six years. Unfilled orders on hand July 30, 1921, are declared to total \$1,500,000.

**Rubay Co.,** Cleveland, maker of automobile bodies, has declared the regular quarterly dividend of 1½ per cent on preferred stock, payable Oct. 1 to stockholders of record Sept. 20. The company has current assets of \$685,000, as against current liabilities of \$134,010, and has sufficient orders on hand to keep the plant operating on a profitable basis until next March or April.

**Fisk Rubber Co.** will increase its capital stock from \$5,000,000 to \$25,000,000 in first preferred and from \$7,000,000 to \$10,000,000 in second preferred, and from \$20,000,000 of stock of \$25 par value to 1,250,000 shares of common no par.

**Sedan Body Co.** of Union City, Ind., has increased its capital stock from \$125,000 to \$250,000.

**Autocar Co.,** Ardmore, Pa., has issued \$1,500,000 in 6 per cent serial gold notes.

## M. A. M. A. ELECTS CLARK

**NEW YORK, Sept. 20**—Ezra W. Clark, advertising manager of the Clark Equipment Co., Buchanan, Mich., has been elected chairman of the executive committee of the advertising managers' council of the Motor & Accessory Manufacturers Assn. He succeeds E. C. Tibbetts, formerly advertising manager of the B. F. Goodrich Rubber Co.

\$10,000,000 Chinese  
Truck Order Made

**Shanghai Motors Buys 3300  
Vehicles from Multnomah Com-  
pany—New Field Seen**

**SAN FRANCISCO, CAL., Sept. 21**—The Shanghai Motors Co. of Shanghai, China, has placed an order with the Multnomah Motor Co. of Vancouver, B. Co., for 3300 especially-designed motor trucks. The order is subsidized heavily by the Chinese Government, according to reports of the deal received by truck distributors in San Francisco, and the purchase is the largest made in one order from the Orient since motor vehicles were introduced there.

The order calls for an expenditure of \$10,000,000 by the purchasers. It is understood that the trucks are to be used in Government-aided transportation systems operating out of Shanghai and Hongkong, China. It indicates that road building is proceeding rather more rapidly in China than has been reported hitherto, and that the Government is taking a considerable interest in the problems of transportation and distribution.

More important than this, it shows a rapidly opening field for the sale of American automotive vehicles in the Orient. The Multnomah Motors Co. sent a motor truck expert to China, while this order was being negotiated, to survey the field for which the trucks are wanted, and as a result has built a narrow-gauge, 1½-ton truck, capable of traveling, with rugged endurance, the narrow trails beyond the completed roads in that country. The narrowness of construction is said not to interfere with ease of handling on narrow turns, or with freight carrying capacity.

The company's plant at Vancouver is being enlarged to accommodate rush construction of the trucks, shipment of which to China is to begin Dec. 1, and proceed at the rate of 150 a month, for 22 months. Robert E. Cavette is president and founder of the Multnomah company, and the man largely responsible for the big sale of trucks in China is M. J. Briggs, general sales manager.

Durant of Canada Will  
Be Incorporated Soon

**NEW YORK, Sept. 20**—Durant Motors of Canada, Ltd., will be incorporated in the near future with a capital of \$2,000,000. Until the formal organization is completed W. C. Durant will serve as president. The active head of the corporation will be one of the leading men of Canada in the automotive field but his identity has not yet been disclosed. Temporary executive offices have been opened in the Royal Bank Building in Toronto. Further details of the organization and personnel are expected to be announced in the near future.

## MEN OF THE INDUSTRY

E. C. Morse has been appointed sales manager of C. H. Wills & Co., Marysville, Mich., manufacturers of the Wills Sainte Claire motor cars. Prior to his entry into the motor car business Morse was for a period of seven years a director and manager of the foreign department of the National Cash Register Co. of Dayton, Ohio, beginning his career in the motor car business as commercial manager of the E. R. Thomas Co. of Buffalo, N. Y., at that time marketing both the product of the E. R. Thomas Detroit Co. and the product of the Buffalo plant. Morse later, and upon organization of the Hudson Motor Car Co. of Detroit, was made sales manager of that company. Subsequently Morse was made vice-president and general manager of the Chalmers Motor Co. of Detroit. In 1917 Morse became associated with the Willys-Overland Co. as its Washington representative. At the end of the war Morse was made vice-president and general manager of the John N. Willys Export Corp. in New York.

Percy Frost Smith has resigned as joint managing director of Tilling-Stevens Motors, Ltd., a widely known British concern. For the past seventeen years he has been associated with Tilling-Stevens' interests, first with Thos. Tilling, Ltd., of London, and since 1915 to Aug., 1921, with Tilling-Stevens Motors, Ltd. Jointly with W. A. Stevens, Smith evolved the noted Tilling-Stevens gas-electric drive for motor-buses and motor-trucks, and since the resignation of Stevens, in 1915 from Tilling-Stevens, Ltd., he has been solely responsible for the further developments and evolution of this type. Smith is prepared to enter into negotiation with any American interests desirous of manufacturing or using gas-electric vehicles.

H. E. Rice has resigned as commercial manager of the Atwater Kent Mfg. Co., Philadelphia. He will immediately become associated with the American Bosch Magneto Corp. as assistant to Arthur T. Murray, president of the corporation. Rice has been associated with Kent in the Atwater Kent organization for nearly twelve years and has been in active charge of both contract and replacement sales, service, promotional work, advertising and sales engineering.

Charles B. Tamm of Milwaukee, for several years chief purchasing agent of the LeRoi Co., manufacturer of passenger and commercial car and tractor engines, has resigned to accept the position of assistant general manager of the Hydro-Holst Co., which is affiliated with The Hell Co., Milwaukee, manufacturing motor truck dump bodies, truck tanks, etc. Mr. Tamm was associated with the Hell company prior to joining the LeRoi company.

L. K. Rittenhouse has succeeded L. I. Ris as eastern district manager of The Star Rubber Co., Inc., New York. Rittenhouse has had fourteen years of experience in the tire industry as salesman, branch and district manager with the Diamond, Goodrich and Firestone companies.

Peter Entringer, for three years secretary of the Johnson Motor Co., Fond du Lac, Wis., has resigned to form new connections. He is a pioneer dealer of Wisconsin, having been for twelve years in business at St. Cloud, Wis., before joining the Johnson company.

H. L. Corey, advertising manager, Champion Spark Plug Co., Toledo, will enter the advertising business in Utica, N. Y., Oct. 1, going with E. B. M. Wortman. The name of the agency will be Wortman & Corey.

Fred Wilson, well known in the selling end of the automobile industry, has been named general sales manager of the Stutz Motor Car Co. of America, Indianapolis, and has assumed his new duties.

Earl F. Berry, formerly of the sales staff of the Reeke-Nash Co., Milwaukee, has acquired an interest in the Milwaukee Oldsmobile Sales Co. and becomes secretary and treasurer.

J. W. Stannard has resigned as president of the Industrial Cost Assn. Horace S. Peck, comptroller S. K. F. Industries, Inc., New York, has been elected to fill the vacancy.

Kansas City Looks  
for Big Truck Year

KANSAS CITY, Sept. 20—With more than \$100,000,000 to be spent in Kansas for good roads and with Missouri standing ready to spend \$60,000,000 for the same purpose, prospects for a big truck year with Kansas City dealers are very bright, according to C. D. Cook, local dealer in Master trucks.

The two States will furnish plenty of truck buyers, Cook says, and already the orders are beginning to come in as the contractors prepare for the building of these highways.

Cook says the truck business in Kansas City and the district is better in general than the automobile business proper.

The road building programs in the two States make necessary the use of numberless trucks and while the contracts have not as yet been awarded, contractors who know their "eggs" are now placing orders so that they will be prepared to take up the work the minute the contracts are signed.

Contractors from all parts of Missouri and Kansas are taking time to study trucks, Cook declares. They call along motor row and collect data and specifications and many are already buying.

## SIAM GETTING BUSY

LONDON, Sept. 5 (*By Mail*)—The recent strike of oil in the north of Siam has made that country realize that motor transport has advantages over elephants and rafts. The result is that a highway capable of bearing teak-drawing tractors and rice-laden trucks is projected. This road will be 600 miles long and will run north to the boundary from Bangkok. Already 125 miles of this road is ready for traffic. Go-ahead exporters might be well advised to establish agencies at Bangkok.

## LARGEST MECHANICS' LIEN

DAVENPORT, IOWA, Sept. 21—The largest mechanics' lien ever filed in Scott County was filed by Blunk & Joenke, contractors, for \$26,666.33 against the Sears Tire Equipment Co., formerly the Altenburg Tire & Equipment Co. R. B. Altenburg, former president and general manager of the company, and H. M. Rose, former vice-president and sales manager, have filed suits against the company to collect salaries alleged to be due. Altenburg's claim is for \$1,250 and Rose's for \$276.

## INDUSTRIAL NOTES

Mason Tire & Rubber Co., Akron, announces that capacity of the tire department will be doubled by the first of the coming year. Contracts for the installation of new machinery to provide for the increased production have been let. After the new machinery is installed the company will have capacity for 4000 tires and 4000 tubes a day.

B. F. Goodrich Rubber Co. is maintaining its volume of sales. In August and, in fact, in the whole period since last May, it has sold at least as large a volume of merchandise—measured in units—as in any similar period in history. By liquidation of inventories the company has substantially reduced its bank loans from the \$15,000,000 at which they stood a month ago and \$29,000,000 on Dec. 31, last.

Gramm-Bernstein Motor Truck Co., Lima, Ohio, has shipped the first ten trucks of the large order received from its English representative. The factory force is being increased gradually, although the demands for the Speed Truck and the heavier models have not as yet increased sufficiently to require the addition of the full working force.

American Motors Corp., Plainfield, N. J., which is now in receivers' hands, was declared amply solvent by the United States Court, which authorized the continuance of the business with Proctor W. Hansl, formerly vice-president and treasurer, and James Kerney of Trenton acting as receivers.

H. H. Franklin Mfg. Co. reductions in prices have been followed by a marked increase in sales. Shipments for eight working days following the announcement of the cuts exceeded by 94 per cent shipments for the same period preceding the decrease.

Oshkosh Tractor Co. has started excavation work at Oshkosh for the new works of the company, which was organized some time ago with \$1,200,000 capital to take over the entire business of the La Crosse Tractor Co., and will transfer it to Oshkosh.

Fisher Body Ohio Co. has begun production of parts for stock. By Nov. 1 the plant will be turning out a complete line of closed bodies for shipment. Open bodies later will be turned out. Before Jan. 1 more than 1000 men will be at work.

Stowell Co., South Milwaukee, Wis., maker of malleable castings, has acquired the entire business of the Pelton Steel Co., Milwaukee. The Stowell company will continue under the Pelton name.

McClure Mfg. Co.'s plant in North Marion, Ind., has been leased by the Guttman-Rawley Furniture Mfg. Co. of Shirley, Ind. The company will make automobile tops in addition to furniture.

Fisk Rubber Co.'s August production ran up to 230,000 tires, or 5000 in excess of maximum estimates at the opening of the month. This is the high water mark for the year.

Gem Gasoline Lock Co. is a new Columbus, Ohio, concern which manufactures a patented lock for the gasoline line for motor vehicles. Oscar Redmond is manager.

Quaker City Rubber Co., Philadelphia, will move into a new home Nov. 1. It has been located in its present place for a quarter of a century.

Gardner Motor Co. shipments for the first six months of this year amounted to 2084 cars and the sales in July totaled 700 cars.

Timken Roller Bearing Co., Columbus, Ohio, has announced a 10 per cent reduction for hourly and piece work employees.

# Calendar

## SHOWS

Sept. 28-Oct. 8—New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.

Nov. 14-19—Jersey City, Second Annual Automobile Show of Hudson County Automobile Trade Association. Fourth Regiment Armory.

Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.

January—Chicago, Automobile Salon, Hotel Drake.

Jan. 7-13—New York, National Automobile Show, Madison Square Garden, Grand Central Palace Auspices of N.A.C.C.

Jan. 28-Feb. 2—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.

Jan. 30-Feb. 4—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.

Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.

## FOREIGN SHOWS

September—Buenos Aires, Argentina, Passenger Cars and Equipment. La Pabellon de las Rosas. Automovil Club Argentino.

September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery. Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.

Sept. 23-Oct. 2—Berlin, German National Automobile Show, Auspices of German Automobile Mfg. Ass'n and German Automobile Club.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Oct. 10-22—Olympia, England, Truck Show. Nov. 4-12—Car Show. Nov. 23-Dec. 3—Motorcycle Show.

Nov. 4-12—London, British Motor Show, Society Motor Mfrs. and Traders.

November 7-14—Paris, Seventh International Exposition of Aerial Locomotion in the Grand Palais of the Champs Elysees, Held by the Chambre Syndicale des Industries Aeronautiques.

March, 1922—Santiago, Chili, Annual Automobile Show.

May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.

Sept. 1922—Rio de Janeiro, Brazil, Automobile exhib-

its in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

Oct. 12-14—Chicago, Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

Nov. 15-16—New York, Convention of Factory Service Managers, National Automobile Chamber of Commerce.

Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

Jan. 17-20, 1922—Chicago, American Road Builders Association.

## S. A. E. MEETINGS

Detroit, Sept. 23, Oct. 21, Nov. 18, Dec. 23, Feb. 24, March 24, April 28, May 26.

Dayton, Oct. 1—First Fall Meeting.

New York, Jan. 10-13, 1922—Annual Meeting.

## VanZandt Was Freed from Revere Liability

INDIANAPOLIS, IND., Sept. 21—A document purporting to release Newton VanZandt, ex-president of the Revere Motor Car Corp., from any liability in connection with the affairs of the company, has come to light in preparation of the evidence to be submitted to the Cass County Grand Jury, now in session, and which will investigate the affairs of the Revere corporation, which is in the hands of a receiver.

The record of meetings of the Revere corporation directors is in the hands of prosecutor and will be taken before the grand jury. An examination of this record shows a copy of the document entered under date of Jan. 20, 1921. Van Zandt holds the original copy of the document.

The record of minutes also shows the directors passed a resolution at the same meeting absolving from liability C. H. Wilson, one of the directors and officers of the company. Attorneys interested in the case declined to say what effect the document probably would have.

Following is a copy of the document:

"For valuable consideration delivered to the undersigned, Revere Motor Car Corp., by Newton VanZandt, receipt of which by Revere Motor Car Corp., is hereby acknowledged, the undersigned corporation hereby releases the said Newton VanZandt from any and every claim of any and every nature whatsoever which the undersigned may or might have against said VanZandt arising out of any transaction of any nature whatsoever from the beginning of the world to the day and date of these presents.

"This release to be binding upon the successors and assigns of the undersigned corporation and to inure to the benefit of the heirs, executors, administrators and assigns of the said Newton VanZandt.

"In witness whereof the undersigned corporation has by direction of its board of directors set its hand and the official seal to these presents this 20th day of January, 1921.

"REVERE MOTOR CORP.,

"By Allen Seagraves, vice-president.

"Attest: E. R. Mattingly, secretary  
"Corporate seal."

VanZandt also contends that the stock issued to him was entirely separate from that alleged to come under the "blue sky" law.

## Seiberling Reported Still After Republic

CLEVELAND, Sept. 21—It is understood here that F. A. Seiberling, former president of the Goodyear Tire & Rubber Co., has resumed his negotiations for the purchase of the plant of the Republic Rubber Co. of Youngstown, which is now in the hands of a receiver. Some time ago, it was stated, Seiberling made an offer of \$2,500,000 for the factory. This proposal is said to have been satisfactory to the stockholders, but the creditors did not think the sum adequate. Since that time a new creditors' committee has been named.

Seiberling recently visited the plant of the Portage Tire & Rubber Co. at Barberton, which is in bankruptcy. This would seem to lend additional weight to the report that he proposes to establish a chain of rubber plants through the Middle West.

## WILLS DEALERS MEET

DETROIT, Sept. 22—Reports at the first meeting of distributors for C. H. Wills & Co. held at Marysville, indicated that business would show steady gains. E. C. Morse, the new sales manager of the company, was introduced to the distributors and outlined the policies which would govern him in his handling of the business.

## Ford Nitrate Matter Again Before Weeks

WASHINGTON, Sept. 20—Negotiations for the purchase of the Muscle Shoals establishment by Henry Ford are still pending. W. B. Mayo, chief engineer of the Ford organization, conferred to-day with Secretary of War Weeks and his advisors but he was not authorized to submit a new proposition in behalf of the Detroit automobile manufacturer.

Mayo discussed the possibilities of developing the power plant in Alabama. There have been many protests to the War Department from farmers and others, but it is known that Secretary Weeks is disposed to take the Ford offer as the best proposition. The Government cannot afford to operate the plant either independently or by a subsidy. It is reported that the offer submitted by a southern promoter had been considered, but a question had developed whether or not sufficient capital could be raised to make the necessary payment.

A report will be submitted to Ford at an early date, together with Mayo's recommendation. It is believed that Ford himself will conduct the final negotiations with the War Department.

Secretary Weeks stated that one point of difference between Ford and War Department engineers relates to the cost of finishing the Wilson and No. 3 dams. Ford proposed repaying \$28,000,000, which he assumed would be the cost of completing the Wilson dam. Secretary Weeks estimates that the work would cost twice that amount and is seeking further information which is to be supplied by engineers who now are making an investigation. Another point of difference relates to the demand of the guarantee by the Government of a certain horse-power. However, this point is not to be an important obstacle in view of reports that Ford claims there never was any such demand made.

### The Best Proof of the Four Cylinder Motor Is Its Place in the Truck Field

Trucks are now actually doing 15% of the total land haulage of the country. This is a splendid tribute to the four-cylinder engine, since fully 94% of all truck models are equipped with four-cylinder motors.

To be profitable, truck performance must be as nearly uninterrupted as possible; it must entail low maintenance and must be economical of

gasoline, oil and tires.

The importance of the engine is paramount. It must be steady and powerful, simple of construction and well made to endure in truck service.

Particularly is this true in the speed-truck, where in addition to load, it must cover the ground quickly.

The Lycoming Motor has a well established place in the speed-truck field, because its sturdiness, its dependability and its ability to give consistent service under all reasonable conditions have made of it an equipment asset to both manufacturer and owner of a speed-truck. Write for booklet describing Model "KB" and giving specifications.

## FEDERAL BEARINGS

### UNIFORMITY

The Babbitt lining in every Federal Bearing shows the same tough, fine-grained, homogeneous structure because every Bearing is chilled immediately after it is lined.

### SOLIDITY

Every Federal Bearing is guaranteed absolutely free from porosity, because the process of manufacturing makes it impossible for the Babbitt to contain air while cooling.

### 100% BOND

Unlike all other methods of manufacturing Bearings, the Babbitt lining and Bronze Back of every Federal Bearing is Bonded UNDER PRESSURE while the adhering alloy is at a constant temperature.

### EXCELLENCE

Every Federal Bearing is manufactured from the highest grade materials, machined accurately and subjected to the most rigid inspection, because "FEDERAL, DETROIT" must be stamped on the back.

EVERY FEDERAL BEARING IS LINED BY

## Getting the Best Out of the Dealer Organization

A loyal dealer organization is an important selling asset. Dealers' problems are especially acute now. The manufacturer who is constructively helpful at this time can build a sound basis for future sales

By Norman G. Shidle

**T**HE necessity for more intensive selling effort has been met in various ways by different manufacturers. Some are making strong efforts to study their marketing problems in a scientific manner; to analyze sales possibilities in various territories. In many cases, a kind of economy in sales expense has been achieved by simply cutting off certain appropriations and activities. In others, however, it has been recognized that true economy lies rather in rendering sales effort more efficient so that the same results may be produced at less cost.

The whole problem of marketing and merchandising costs and methods is due for some very careful study. Friction anywhere along the merchandising line means just so much greater selling cost and just so much lost profit.

Of all the angles concerned in the problem, however, none is more difficult and important than that of dealer relationships.

Manufacturers have undoubtedly done a great deal for their dealers. Some, of course, have done more than others, but all have done something. During a period of selling difficulties like the present a closely knit, harmonious dealer organization is more necessary than at any other time. The life and success of the dealer and manufacturer are so strongly interdependent that both must pull in the same direction.

But the primary object of the manufacturer, of course, is to sell more automobiles. He is developing good dealers when he is handling them in such a way as to enable them actually to sell a greater number of cars.

In the desire to mold a closely knit dealer organization, however, there is sometimes too strong a tendency toward centralization. There are certain phases of merchandising effort in which the manufacturer must necessarily take an active part, both for his own good and that of the dealer. The territorial analysis work being done by certain companies, for instance, is a necessary step in the development of sound merchandising policies and plans. The scope of such work, the fundamental factors involved and the extensive research necessary make it too difficult of performance for the average dealer. Sales helps and plans of various kinds devised and sent out by the manufacturer often give very valuable aid to dealers in making sales to the consumer.

But a point may be reached where the desire of the manufacturer to help becomes paternalistic or despotic. The average intelligence and capability of the dealer may be underestimated. Measures may sometimes be adopted for this reason or because of lack of confidence in dealer personnel that definitely tend to lower the dealer's efficiency, increase his dis-

content and create that friction which means greater selling costs.

Some dealers claim, for example, that manufacturers object to having the dealer build up his personal prestige in his territory; that the manufacturers insist that the dealer advertise only the car and that he refrain from institutional advertising designed to tie up the customer with the dealer himself. In certain cases, it is said, this objection has even reached the strength of a prohibition which left the dealer no alternative except to comply or give up the agency.

The objection to the dealer building his business on his personal reputation and ability, of course, comes largely from the fear of the manufacturer that the dealer, if successful in such a plan, would hold the whip hand over the manufacturer so far as the given territory is concerned. The dealer might so build up his personal prestige that he could dictate to the manufacturer in certain instances, because he could switch to another make of car and carry his customers with him. This has been done in the past, and it is doubtless the cause for the fear in some cases that it will be done again.

This is just one sample of the tendency sometimes manifested toward a dictatorial attitude in an attempt to develop a highly centralized dealer organization. The whole discussion concerning the justice or injustice of certain clauses in the usual dealer contract reveals numerous other similar difficulties.

The perfect dealer organization is not that in which the dealer is so tied up that he must do just as he is told in every

case. Such dealers do not sell a maximum number of cars. It must be recognized in this matter, as in any other involving organization of human beings, that as individual responsibility is decreased, the necessity for supervision is increased. As the incentive for individual effort is removed, the permanent efficiency of the individual and, consequently, the organization is lessened.

No man can function at maximum efficiency unless he has a constant opportunity for growth and development. He must be enthusiastic and loyal. It must be admitted that a dealer who builds for himself and his business a place of high esteem in his community and who is personally popular and respected will sell more cars than the one who is a nonentity in his community. Suppose that such a dealer is thoroughly sold on the car which he is handling; that he has entire confidence in the company which manufactures it; that he has always had a square deal from his manufacturer in every way. This dealer is the greatest asset a company can have. But such a dealer is not developed by submerging his own business personality entirely in that of the car.

He is worth infinitely more to the manufacturer than ten dealers who are dissatisfied because they do not like dictatorial policies; who stay with the manufacturer because they are involved too heavily financially to be able to make a change, and who feel that they are making money in spite of the treatment accorded to them by the factory.

But all dealers are not like the excellent one pictured. Taken as a class dealers are just about the same sort of human beings as manufacturers. Some are

worthy, dependable and trustworthy. Others are not. It is against the latter class that the manufacturer often feels it necessary to protect himself. But in so doing he may develop his organization along lines that do not make for ultimate efficiency.

One large manufacturer said recently, "If I could go all over the country and have my pick of any dealers that I wanted and could choose for my own organization any 10 per cent from all the dealers I could select men whom I could trust implicitly, never have any trouble in regard to contracts and give them every leeway with perfect confidence. I wouldn't care whether I had any contract or not.

"On the other hand, if the dealer had a similar free choice, he could readily select a group of 10 per cent of the manufacturers in whom he would have similar confidence."

The real task of the manufacturer is to enlarge the percentage of this trustworthy class of dealers, rather than to attempt to entirely control and dominate those in whom he has little confidence and those who have little confidence in him. To do this is no easy task. It requires sincere effort and an attempt to see the other man's point of view all along the line.

There is much talk of the necessity of educating the dealer. Considerable progress along this line has been made by many manufacturers. Education, however, consists in aiding the dealer to develop himself, to develop his own capabilities, his own business and his own responsibilities. If a dealer has been honestly treated in all his relations with the manufacturer and feels himself to be an integral

part of the organization whose cars he is selling, he is not nearly so likely to turn his back on that manufacturer should the opportunity to do so arise, as is the dealer who has retained an agency simply because of necessity.

The best dealer—for himself and the manufacturer—is the one who is self-confident, prominent and respected in his community and a real sound business man. Such dealers cannot be obtained and held by a factory which adopts dictatorial policies, attempts to get the better of its dealers in contracts, attempts to shift burdens of depression entirely on to the dealers and which delivers cars in an unsatisfactory condition.

The much discussed dealer contract is a matter for psychological rather than legal settlement ultimately. The perfect dealer contract—entirely satisfactory to manufacturer and dealer—can never be written. The spirit behind the contract in both cases will always be the determining factor in making for satisfaction or dissatisfaction.

A prominent lawyer who has as clients a number of large automobile dealers and distributors said the other day that the matter of the dealer contract could never be settled by both the manufacturer and dealer trying to write into it protective clauses. To approach the question from that angle he considers is hopeless. In his estimation the only way out is through a better understanding between the two parties in each case, an honest attempt by both to see the other fellow's point of view and to give him a square deal in every way.

At the present time some companies are in a position

temporarily to dictate to their dealers. The dealer must either knuckle under or throw overboard a business and an investment which means his bread and butter. Business will return to normal. The handling of the dealer situation just now should be especially directed with an eye to the future.

The manufacturer who does his best for his dealers during a time of depression will be in an exceptionally strong position when business again starts up. The manufacturer has an obligation to fulfill. He cannot afford in any case to expect the dealer to bear more than his fair share of the burden of industrial depression.

One manufacturer, for instance, has tied his dealers

to him very strongly by his actions before the depression set in. This manufacturer saw the dark cloud coming. He warned his dealers of it; kept them from overstocking, reduced his production and took his loss in the beginning. When good times come again this manufacturer's dealer organization can be expected to show a loyalty and an enthusiasm for the particular car that will be unusual.

There is an old saying that he who gives most gets most. Until this is generally accepted, business difficulties will continue to arise and become complicated, human relationships in business will continue to generate friction and inefficiency and relations between dealers and manufacturers will not be satisfactory. It is the spirit behind the dealer contract that counts.

## Neon Filled Tubes for Ignition Circuit Tests

NEON, one of the gases which exist in extremely small proportions in the earth's atmosphere, has, as compared to air, a very slight resistance to the passage of electric current. The passage of a current through the gas causes it, under certain conditions, to emit an orange-red light, the intensity of which varies with the difference in potential, causing the discharge of current through it. This property is made use of in a special instrument designed for use in testing ignition systems.

The body of the gage is formed by a hard rubber tube closed at one end and sealed at the other by a brass cap. A small sealed glass tube containing the neon gas under a pressure considerably less than atmosphere is positioned within the rubber tube between two plugs of fine steel wool which fill each end of the outer tube and give it considerable electrical capacity. The glass tube is coated over the greater part of its external surface with silver, but a band about 3/16 in. wide and a spot opposite the window in the rubber tube is left uncoated. The silver coating remains in contact with the steel wool at each end, but the uncoated band forms a gap in the electrical circuit between the two ends of both tubes.

The gage functions in the following manner: When the metal cap is placed in contact with or close to a conductor, such as the terminal of a spark plug, which is receiving an electrical charge, the end of the gage adjacent to the conductor is also charged since the gage forms a portion of the capacity of the circuit, and this induces a charge of opposite polarity in the opposite end of the gage. The steel wool and the metal coating on the glass tube then become condensers (of relatively small capacity). In assuming this charge a current is induced in the neon gas column, the positive ions of the gas flowing toward the negative pole of the tube and the negative ions toward the positive pole. This flow of current causes the gas to glow, the intensity of the glow increasing as the potential increases.

When placed in contact with a spark plug terminal there is a flash of light each time the plug fires. The narrower the gap the lower the potential required to jump it and the duller the glow, and vice versa. If the electrodes of the plug are too close or the gap between them partly filled with carbon, the glow is dim. If the gap is too wide the flash is extremely brilliant, while for a correctly set and properly functioning plug the flashes are of intermediate brilliance. If the plug is shortcircuited the charge passes directly to ground, the tube is not charged, since no potential is built up, and no flash occurs. It is thus a simple matter to locate plugs which are missing or giving too weak a spark.

The Airco neon filled spark indicator

By passing the end of the tube along a high-tension wire, leaks are easily located, for the tube will glow brightly at a point where the insulation leaks, whereas, it will not glow at all or only very dimly at other points.

Since the body of the indicator is of rubber it can be held in the hand without the charge passing to ground through the body of the observer. The Airco spark indicator is manufactured by the Air Reduction Co., a concern producing air products from the distillation of liquid air. In making the liquid air the temperatures attained are not sufficiently low to liquify the helium and neon content. These two gases, together with some nitrogen, are trapped off and later separated by other means.

STAINLESS steel is being extensively used for the inlet and exhaust valves of internal combustion engines of all kinds. It is also being used in at least one instance for piston pins, and for the bolts and nuts of exhaust pipes and mufflers. As usual, the best results are obtained by polishing the objects to a high degree.

# Refinements in Control Characterize the New Hudson

Clutch and brake controls and the steering gear have been redesigned to facilitate ease in handling. Carbureter air is pre-heated and the cast-in manifolding changed to afford better fuel vaporization.

By J. Edward Schipper

**T**HE new Hudson Super Six model is now in production and being delivered to dealers. The principal changes are those intended to effect ease of control. In carrying out these changes, the front compartment has been redesigned and the details of the control mechanism have been so improved as to provide easier steering and easier pedal and control lever action. Changes have been made in the clutch and transmission, resulting in a lighter clutch pedal action as well as an easier gearshift. The brake linkage has also been altered to render the brakes more responsive.

There have been some changes which affect the external appearance of the car, particularly in the adoption of new fenders and front apron and some body fittings have been improved.

The engine, which has been in use since 1916, has been continued without any fundamental alterations. A change has, however, been effected in the air intake and manifolding. It has previously been Hudson practice to use cold air; on the new car, all of the air for the carburetor is pre-heated. Globe elbow joints are used to give a large sectional area to the piping at the turns and at the entrance to the carburetor. The air is heated

in a stove which is integral with the exhaust manifold on the right side of the engine and is led over the top of the engine to the carburetor, on the opposite side. The carburetor is attached to a vertical flange at about the center of the block. The air pressure at the carburetor inlet is balanced with that in the float chamber by a compensating tube which connects the float chamber with the air intake. This is said to conserve gasoline on quick throttle opening.

Internally, the manifolding has also been so altered that a modified form of a hot-spot is provided between cylinders 1 and 2 and 5 and 6. The intake manifold at these two points is brought into close proximity with the exhaust. Liquid fuel which collects in the pocket aids materially in shortening the warming-up period.

While the clutch employed in the new Hudson is fundamentally the same as that in older models, lighter-driven parts are employed to facilitate gear shifting. In the new construction, the transmission shaft is continued forward and forms the clutch shaft, eliminating the three-jaw slip joint used formerly as a connection between the clutch and transmission shafts. This shaft

Sectional and end views of Hudson transmission

Views of new cylinder block, showing changes in cast-in manifold

The new Hudson clutch assembled

has a pilot bearing in the flywheel and carries the driven disks on a die cast aluminum drum. These driven disks are light, thin disks and do not carry the cork inserts which are now in the driving disks. Formerly, the driven disks carried these cork inserts and were the heavier of the two sets. This drum also carries cup-shaped inserts which act as the clutch spring retainers. There are eight clutch springs spaced equally about the aluminum drum, giving a uniform pressure on the bearing surfaces of the disks. The clutch release spider depresses these clutch springs during disengagement. A more positive separation of the clutch plates is insured by small springs placed between the clutch disks. The use of these springs prevents any tilting of the disks. There are also anti-rattle springs placed between the disks so as to prevent noise when the clutch is disengaged.

The clutch thrust bearing grease cup used in previous models has been eliminated. A large annular ball throw-out bearing, automatically lubricated by the oil in which the clutch runs, is now employed. The die-cast drum and the extensive use of stampings gives a balanced clutch which is manufactured at a reasonable cost and without an exceptional amount of machining work.

The new gearset is not materially different from the old. The shifter mechanism is now mounted in a sub-assembly with the top cover plate. The speedometer drive has been enclosed and is now incorporated with the gearbox. The gear shifter lever has been lengthened and the ball handle placed closer to the driver's hand than formerly.

Another change which affects the ease of operation of the car is in the emergency brake lever. In addition to greater leverage, the ratchet has now been made heavier and the ratchet teeth larger. In order that this change does not affect the number of positions in which

the brake lever may be placed, there are now two pawls employed which come into action alternately and give the effect of twice the number of teeth on the ratchet.

Ease of steering has been secured by changing the ratio of the steering gear from  $7\frac{1}{2}$  to 1 to  $9\frac{1}{2}$  to 1. This also results in a heavier worm wheel with consequent longer life. The drag link is now a one-piece tube instead of being welded in the usual way. The accelerator pedal is now placed to the right of the brake pedal and is designed to prevent a cramped foot position.

The lubricating points on the chassis are taken care of by a new type of oiler which does away with the old-

Wick feed oiler  
used in new Hud-  
son model

fashioned grease cups. The oiler contains a reservoir and a wick feed. A new pump type of oil can is provided with the car to fill the oil reservoirs.

In exterior appearance the Hudson is changed but little. Deep crown fenders which, because of the increased depth of flange are more efficient as mud guards, have replaced the previous type. The front fenders now have aprons which extend to the extreme front end of the spring hangers. A splash apron placed between the spring horns improves the appearance of the car and affords further protection.

The wheelbase of the car remains the same, as do all of the major specifications. The tire size is unchanged but the tires now provided are cord in place of fabric. In the detail work of the body, there have been a few changes, although the body lines remain the same. The door jambs are now of pressed steel in place of wood and, consequently, more durable and solid. There is also an improved type of side curtain provided giving better weather protection. The windshield is now fitted with a metal strip with a rubber interlining between the two glasses. The price of the car remains unchanged.

## Germans to Hold a Grand Prize Regularity Race

A GRAND Prize regularity and speed contest is to be held in Germany this fall under the auspices of a committee of which C. O. Fritsch is chairman. Only stock cars manufactured in Germany or Austria are eligible for entry, and these must have piston displacements corresponding to the German tax horsepower ratings of 6 and 8 (95.6 and 127.5 cu. in.). Cars of each rating will run in a separate class, and there will be subdivisions according to whether the engine has the valves in side pockets (standing valves, as they are called in Germany) or valves in the head (hanging valves). The minimum weight for the 8 hp. cars without fuel and tools is 1760 lbs. and the minimum weight for the 6 hp. cars 1430 lbs. The minimum tire sizes are 33 x 4.8 in. and 33 x 4.2 in. respectively.

Only manufacturers and dealers can enter cars, and no more than three cars of any one make can be entered. Bodies for the competing vehicles must be built in accordance with designs furnished by the race management. Grand Prize will be awarded to the contestant whose circuit times show the least variation. There will also be speed prizes in each class. Minimum speeds of 46.7 and 40.4 m.p.h. are required in the two classes.

# A New Swiss Magneto of the Inductor Type

Newcomer in American market incorporates many ingenious ideas. Rotor is a bell-shaped magnet forged integral with driving shaft. Both windings are stationary, hence no collector ring is required. One feature is accessibility of interrupter which is found by lifting a cover.

**A**N interesting design of magneto of Swiss manufacture, the Scintilla, has recently been introduced on the American market. It is of the inductor type, without movable windings, and while it comprises the same parts as any other magneto, considerable ingenuity has been displayed in the arrangement of details, whereby a number of advantages in manufacture, care and maintenance are secured.

The rotating part, or rotor, as it is usually called in electrical parlance, is a bell-shaped permanent magnet which has the driving end shaft forged integral with it. The pole pieces of this magnet are laminated, the laminations being slipped over extensions of the forging and held in position by two screws on each leg of the magnet, which screws also hold in place a bronze ring over the ends of the poles with which the shaft at the interrupter end is formed integral. The rotor is supported in ball bearings at both ends.

The magnetic circuit is completed by two laminated pole shoes set into the die-cast aluminum alloy housing and a laminated core extending through the stationary coils. The core is of substantially square section with rounded corners; its ends are slotted and it is fastened to the pole shoes by a machine screw at each end, passing through the slot and into the pole shoe. Both the primary and secondary coils are wound on this core, and the condenser is also incorporated in this unit. As both windings are stationary there is no need for a collector ring with its attendant difficulties. One primary lead is grounded to the core and the other is brought out to a strip brass connector which extends half way around the coil. At the top this connector makes contact with the low tension terminal from which connection is made to the ignition switch, by means of which the primary winding of the magneto can be short-circuited and the operation of the machine stopped. At the interrupter end there is a similar connection to the insulated block of the interrupter. This is a sliding contact, the interrupter block moving relative to the connector when the timing of the spark is changed. One part of each of these two

connections is spring supported, so that a good, firm contact is obtained under all conditions.

One of the most interesting mechanisms of the magneto is the interrupter. This consists of a cylindrical frame which fits into a corresponding seat in the housing and is locked in place by means of a bayonet lock. The timing lever is formed integral with a cap over the interrupter, this cap being held in place by means of a centrally located machine screw and a pair of dowel pins. There are eight equally spaced holes in a circle in the in-

terrupter frame, and the timer lever, therefore, can be placed in any of eight different angular positions, permitting of adapting the magneto with ease to different engines. There is a special locking ring on the interrupter, with a radial lever which, when it is desired to insert the interrupter in position on the magneto, must be turned relative to the frame, against the torsion of a spiral spring. When in the proper position the interrupter can be pushed into place in the direction of the rotor axis. The lever on the locking ring is then released and the ring is snapped back by the spring, locking the interrupter in place.

For a four or six cylinder magneto a two-lobed cam is mounted on the rotor shaft and co-acts with a bell crank-shaped interrupter lever fitted with fiber cam follower and a fiber bushing. The contacts of the interrupter are always located on top, where they can be easily inspected and are protected from oil accumulations. A feature which is found on few if any other magnetos is that the timer is under the influence of a coiled spring which tends to bring it back to the retarded or late ignition position, so that if the driver is careless in looking after his controls there is little danger of the engine racing due to advanced spark.

To get at the interrupter it is only necessary to remove a cover, known as the interrupter cover. This is clearly shown in one of the illustrations, which also shows the method of felt-packing the housing in order to make it waterproof. This cover can be removed by hand, being held in place by two spring catches, whereas the magneto cover, over the coils and distributor, is held in place by

Cut-away view of Scintilla magneto

two screws. A safety gap is provided on the secondary winding, one of the points of the gap being on the secondary terminal and the other on a brass strip laying on top of the rotor cover and grounded through the housing. A second safety gap is provided by the distributor, as in case of excessive secondary pressures, due to a disconnected cable or similar cause, the spark can jump from one of the distributor sectors to the rim of the distributor gear.

The distributor also is of quite original design. Contrary to conventional practice, it is located at the driving end. This is rendered possible by the fact that the high tension terminals are not at the end of the magneto but on top of it. An eccentric adjustment is provided on the distributor gear so that the center distance of the gears can be closely adjusted for correct mesh and quiet running. The distributor shaft is made integral with a disk which sets into a circular recess in the end plate of the housing and is held in place thereon by two machine screws passing through arc-shaped slots. The shaft or stud is eccentric with relation to the disk, and by loosening the retaining screws and turning the stud and disk through a small angle and then tightening the screws again, the distributor gear can be brought closer to or moved farther away from its pinion.

#### Two Distributor Sectors Offset

The distributor itself is in the form of a drum with two metal sectors embedded in a piece of molded insulation. The contact sectors are offset from each other in an axial direction and are spaced 90 deg. circumferentially. There are four carbon brushes (in a four-cylinder magneto) bearing on the surface of the distributor drum, two being carried side by side in each brush holder. The two pairs of brushes are mounted at 90 deg. with each other. One advantage claimed for this construction, in which the brushholders and brushes do not revolve, is that the pressure of the brushes on the distributor is not affected by centrifugal force, and consequently is uniform and comparatively light under all operating conditions, hence the wear of the brushes should be slight. The two sectors of the distributor are integral with a central plug or core of brass, against which the high tension terminal brush bears. It will be noticed that the high tension connection from the coil to the distributor is exceedingly short. The brush holders can be removed without the use of tools.

One of the illustrations herewith shows plainly the con-

Six-cylinder magneto complete

Distributor brushes removed

struction of the primary and secondary connectors. The secondary cables are forced into holes in the molded brush holder and pointed screws are screwed into the blocks from the end, right through the strands of the cable. These screws do not screw in threads in the insulation but in metal blocks molded in same.

#### Injury From Overoiling Impossible

There are oil holes with snap covers at both ends. Owing to the location of the coils and the interrupter points it is impossible to injure the machine by overoiling. The snap cover over the oil hole at the driving end also covers a timing window. In timing the magneto, the rotor is turned until a figure 1 appears centrally in this window; then the engine crankshaft is turned until the piston in No. 1 cylinder is in the top dead center position at the beginning of the firing stroke, and with the rotor and crankshaft in these positions the gears are fastened to their shafts. All of the secondary terminals are plainly marked as to the cylinder to which they are to be connected, and the direction of rotation is indicated by an arrow on top of the magneto.

These magnetos are manufactured in one, two, four, six and eight cylinder types, the eight cylinder type having a four pole magnet. They are made to S.A.E. standard dimensions. It is claimed that they give a spark of sufficient intensity to fire the charge at a very low speed, and also permit of operation at exceedingly high speed, owing to the fact that the revolving masses are of simple and robust form.

The manufacturing concern in Switzerland is a subsidiary of the firm of Brown, Boveri & Co., which has been engaged in the manufacture of electrical machinery practically since the beginning of that industry.

## Examples of Recent British Transmis- sion Design

The drawings on this page show two four-speed transmissions of British design—the Austin (above) and the Vulcan (below). It will be noticed that both are arranged for center control, a feature only recently incorporated in British practice. The so-called enclosed gate, which has long been characteristic of British cars, is retained in the new position

All bearings are ball bearings, with the exception of the pilot bearing on the Austin, and transmission brakes are fitted in both cases. The provisions made in the design of the Austin for preventing oil leakage from the gear case are interesting

# The Effect of Mixture Ratio and Temperature on Power and Economy

Review of tests conducted at Purdue University shows that marked gains in economy with but trifling loss in power result from proper heating of charge and correct mixture proportions, while smoother performance and less dilution of lubricant are accompanying advantages.

By C. S. Kegerreis\*

THE object of this paper is not to develop something entirely new, but to stimulate interest in a few points which have a large bearing on the cost of operating gasoline engines. Large amounts of data have been published, and many improvements have been made the last two or three years, but the public is not getting either the performance or the mileage from the cars that is possible. Who is to blame for the poor operation and short life of the accurately machined car? Is it the manufacturer or is it the driver? Perhaps it is the result of a combination of circumstances.

To operate a car of the present type it is necessary to purchase the commercial fuels sold on the market. Ten years ago the fuel was so volatile that no great attention was required in its preparation for good combustion. Now the carburetion problem has grown to be of such magnitude that it occupies a prominent place in the automotive world.

The troubles experienced are poor operation due to faulty manifold distribution, sooted plugs and combustion chambers, oil dilution, excessive wear on bearings and pistons and low mileage. These factors not only affect the depreciation of the engine but result indirectly in excessive wear on the other parts of the machine.

\*The author is connected with the Engineering Experiment Station, Purdue University.

Fig. 1

To remedy the faults the trouble must be removed at the very foundation. Obtaining good performance means research on fuel preparation. Once this problem is solved, then the correct fuel-air ratios can be determined and the exact requirements for mileage ascertained. The Engineering Experiment Station at Purdue University has been working on these problems for the last few years. A portion of the results have been published in bulletin form. The data published in this article is taken from some of the tests, which have been checked, and show the requirements necessary for good performance. Once this is attained, then the question of economy can be solved. The data is based on one grade of gasoline (Table 1) of 56.6 deg. Baumé density. The tests run were made on a four-cylinder engine of modern design and all data taken with great care.

TABLE I.

Distillation Data—56.6 deg. Baumé Gasoline

Initial boiling point		Baumé
Per cent off	98 deg. F.	Reading
10	178	79.8
20	210	73.6
30	248	64.2
40	275	58.6
50	288	55.8
60	306	53.2
70	324	51.0
80	348	49.6
90	374	47.7
98	415	43.3

The data presented all refer to operation at half load at 1000 r.p.m. This approximates car conditions at a medium speed. The various points on all the charts represent at least one separate test and in many cases a long series of tests.

Some means of preparing the fuel for good combustion must be used. Different methods have been tried and heat has shown great possibilities. Fuel cannot burn readily without first being converted into a gas. The carburetor, by atomization, aids in tearing the fuel into small particles, presenting a large surface for vaporization. The decreased pressure in the intake manifold lowers the fuel boiling point, and the fuel is dried to some extent by absorbing heat from the intake valves. The quality of fuel we are now using is too heavy to be sufficiently gasified, even on compression, to give uniform and complete combustion. Thus some additional means of furnishing more heat is necessary. Heat may be added by raising the temperature of air entering the carburetor. Fig. 1 shows the results obtained in

Fig. 2

a series of tests with an inlet air temperature of 61 deg. Fahr. to 300 deg. Fahr. Distributing a very wet mixture is difficult. The curves show that at a lower temperature the quantity of liquid at the end of compression is so great that irregular firing will result. Hence the range is very limited. An inlet temperature of 61 deg. Fahr. is so low that one mixture ratio only will give a semblance of regular firing. This mixture, 0.106 lb. gasoline per pound of dry air, is excessively rich. A large portion is being burned in the exhaust manifold. An increase of 25 deg. in the inlet air temperature to 84 deg. Fahr. creates a big change. The range has widened and the limits are 0.065 to 0.985 lb. gasoline per pound of dry air. The engine fires regularly, but the speed is not constant. There is a tendency to surge and the exhaust is not clean in all cases. A temperature of 100 deg. Fahr. or above gives nearly the maximum firing range.

The boundary at the rich end does not follow any definite line. This is due to the excess fuel in the mixture, which causes irregular combustion. The lean limit shows that once 160 deg. Fahr. is reached a much leaner ratio will cause missing or backfiring. It may be of interest to show that if the carburetion is poor some assistance can be obtained by raising the cooling water outlet temperature. On the tests at 61 and 71 deg. Fahr. a low, cooling water temperature would cause the engine to stop. If the temperature was reduced to 160 deg. Fahr. the engine would backfire; if reduced to 120 deg. Fahr. the engine backfired very frequently and at 100 deg. Fahr. the engine would barely run. Even on the 84 deg. Fahr. test series the speed was difficult to control with any mixture.

As the temperature is increased the mixture gradually grows more dry. A glass section was inserted in the manifold so the character of the mixture could be observed at any time. The mixture became quite dry at 225 deg. Fahr. with the leanest ratio used (Fig. 2). The range widened to 0.059 at 250 deg. Fahr. and to 0.1075 lb. gasoline per pound of dry air. The shaded area in Fig. 2 shows the limit of dry mixtures in the ordinary inflammable range. The manifold showed foggy mixtures at lower temperatures. On the same figure will be found the various mixture temperatures for the corresponding inlet air temperatures.

In all cases in the temperature tests at half load and 1000 r.p.m., 160 deg. Fahr. was found to be the minimum desirable temperature for good performance. The engine runs smoothly with no surging, all cylinders firing

regularly. Later tests have proved that the combustion is quite complete, and research on other engines shows 160 deg. Fahr. to be the minimum temperature to give a mixture just dry enough to distribute well and burn readily on ignition. Some portions of the fuel may be gasified after ignition. Oil dilution is not entirely eliminated and a warmer mixture is recommended to eradicate this trouble.

The temperature necessary for good performance for this fuel being ascertained, the question regarding power and thermal efficiency arises. Do the mixture requirements for high power change with the temperature of the air? It is a common belief that the colder mixtures give the greater power, as there is a gain in volumetric efficiency. The facts may be studied in Fig. 3. A low temperature requires an excessively rich mixture for high power. With an air temperature of 61 deg. Fahr. a ratio of 0.105 lb. gasoline per pound of dry air is necessary for maximum power development. The absolute value of the power developed is low compared to the higher temperatures. The richness decreases as the temperature increases until 125 deg. Fahr. is attained. Above this point the ratio is constant, 0.0775 lb. fuel per pound of dry air. The peak of the power curve is a bit too rich. A curve labeled good performance is also shown. This plot represents the mixtures that can be used to develop at least 95 per cent of maximum power and give good acceleration. Thus a bit leaner mixture can be used that will pull well, yet give very high efficiency. The fuel consumption can thus be cut 10 per cent and give very good operation. The power loss will not be high; in many cases it is not over 2 per cent.

The inlet air temperature also affects the thermal efficiency. When using low temperatures the efficiency does not peak until the 0.0975 ratio is reached (Fig. 4). At a temperature where good operation is assured the curve peaks at 0.064. There is little improvement above 160 deg. Fahr. In all cases the big improvement occurs between 60 and 125 deg. Fahr. As the mixture for highest efficiency changes with the inlet temperature, the absolute value of the thermal efficiency increases from 7.50 per cent at 61 deg. Fahr., to 18.60 per cent at 84 deg. Fahr. This is a great improvement for so small a temperature increase as 23 deg. Fahr. Above 84 deg. Fahr. the efficiency remains constant up to the temperature corresponding to a dry mixture and then the decrease is small.

Fig. 3

Fig. 4

In Fig. 3 is plotted the relation between temperature of inlet air and the proportion of mixtures that will give good performance. By using these mixtures a thermal efficiency within 1 per cent of the maximum can be attained. This means high mileage per gallon plus good and smooth running.

The preceding data establish the limits of good operation, power and efficiency as affected by the inlet air or mixture temperature. With the engine running properly the relation between power and thermal efficiency, as effected by the mixture ratio, can be accurately determined. The curves shown in Fig. 5 are the results of run at half load and 1000 r.p.m. In this series a constant throttle opening was used for all tests, and the carbureter adjustment changed throughout the mixture range. The engine fired every cylinder regularly for all ratios between 0.0576 and 0.1275 lb. gasoline per pound of dry air. With leaner mixtures the engine would miss and backfire.

The power peaks at 0.0775 and the thermal efficiency at 0.065. It can be clearly seen in this figure that 0.07 represents a mixture giving negligible decrease in power from the maximum. By using 0.07 instead of 0.0775 a gain in efficiency of 1.5 per cent is made. The ratio 0.0672 represents the chemically perfect mixture with no excess of oxygen and no carbon monoxide in the exhaust. In this series of tests this ratio gave maximum

efficiency with satisfactory operation.

It often happens that two cars of the same manufacture, both in good mechanical condition and using the same air intake temperature, show widely different mileages; one may make 12 miles and the other 20 miles per gallon. It will be seen from the data represented herewith that both may develop the same power and climb the same hills and yet the economy may be very different. Fig. 5 shows a range in performance varying from a 0.07 fuel ratio and 18.3 per cent thermal efficiency to a 0.105 mixture ratio and 12 per cent efficiency.

An engine, to deliver its maximum efficiency, must first have the fuel prepared correctly and then be fed the required mixture for all conditions. Medium or low-priced fuels will not be available long. Even without increase in consumption, the price would be sure to rise and the volatility to decrease. Thus it behooves everyone from the driver to the engineer or capitalist to endeavor to prevent waste of fuel.

Fig. 5

## Diminutive Ignition Apparatus

SINCE the war there have been developed in Germany a whole series of exceedingly small internal combustion engines, some with as small a bore as 40 mm. (1.575 in.), which at 3000 r.p.m. develop from 1 to 1½ hp.. It is practically impossible to mount magnetos of normal dimensions on these engines, and in view of this fact the German ignition industry has produced new ignition devices of corresponding size.

About a year and a half ago the firm of R. Bosch bought out a small rotary ignition device or flywheel magneto which weighs only 2.2 lb., and is intended for small single and twin cylinder engines of either the two or four-stroke type. The permanent magnet is of ring form, which

makes it possible to mount the instrument directly on the crankshaft instead of on the flywheel, thus effecting a saving of weight. Bosch has also brought out a very small spark plug, which has an overall height of only 1½ in. The thread has a diameter of 12 mm. (0.473 in.) and a pitch of 1.25 mm. (19.5 threads to the inch). The weight of the plug is only one ounce. A wire clip connector is used with the plug.

METALL-TECHNIK reports that the addition of 1/5 per cent of metallic beryllium to aluminum results in a light alloy of far better properties than the well-known alloy, magnalium (magnesium-aluminum).

# Experiments With a Reversible Propeller at McCook Field

New device appears to be capable of improving airplane performance through use of variable pitch feature, and promises also to facilitate landing in limited space, and thus aid in solution of landing field problem.

**T**HE invention of the Hart reversible and variable pitch propellers has opened a new field of development for aviation, and appears to be a big step in the improvement of airplane performance, as well as a step toward the solution of the landing field problem.

This propeller was invented by Seth Hart of Los Angeles, Cal. Several propellers were built by Mr. Hart at his own expense in California, and a number of flights were made there by several pilots. The California flights showed such promise of success that Mr. Hart determined to bring the invention before the Government's Airplane Engineering Division at McCook Field early in 1918, and since that time the Army has made many tests and worked out a number of new applications.

The first propeller delivered was given a destructive whirling test to determine the strength of the device. The construction employed proved to have such remarkable strength that the propeller, with a few modifications, was installed on the JN-4-H airplane for flight tests.

The flights with this original propeller extended over a period of about 8 hr. in the air. The principal advantages brought out by these tests were the following: As compared with the fixed pitch propeller, the variable pitch propeller showed an increase in the rate of climb of about 40 per cent, an improvement in ceiling of about 20 per cent, and great gain in the time required for take-off.

Ten of the Hart propellers have been built for such engines as the Liberty 12, Hispano-Suiza, 300-hp. and Hispano-Suiza 150-hp. engines, but to date the reversible feature of the Hart propeller has been tested only on the JN-4-H airplane.

The airplane fitted with this propeller has been flown and landed by different pilots in order to determine the difference in the distance required for landing with and without the reversible feature. The average of fourteen landings was taken. The result of this test determined that approximately 430 ft. was required to land the plane without the use of the reversible propeller, while a distance of only 120 ft. was needed to land the plane with the reversible propeller. While this comparison on the JN-4-H shows a remarkable reduction in the distance required for landing, it is probable that a greater decrease in landing distance will be found with some of the faster planes.

The further development of this propeller suggests many possibilities; such as landing on roofs of buildings or on platforms erected on shipboard.

The use of reversible propellers on dirigible balloons has been developed by a number of foreign nations, and they are considered essential to airships of very large size. The Hart propeller, on account of its light weight, strength and adaptability, is considered a great improvement for this service.

It should be borne in mind that the reversible feature

of the Hart propellers is always combined with the variable pitch feature, and it is possible to adjust the propeller during flight at any angle from a full reverse position to an angle several degrees greater than the normal full ahead position.

In actual operation the Hart propeller is set at low pitch for take-off and climbing. The low pitch gives a good ratio of thrust to torque on the ground, and consequently gives a high thrust and rapid take-off. After leaving the ground the low pitch allows the engine to turn up as fast as desired, giving a very rapid climb. After reaching the desired altitude the propeller may be adjusted to a somewhat greater pitch in order to allow the engine to turn at the proper speed and give the highest airplane speed in level flight.

When it is desired to cruise for long distances the pitch of the propeller is increased still further, holding the engine down to considerably slower speed without appreciable loss of plane speed. The advantages of adjusting the propeller to very high pitch in cruising and throttling the engine only slightly are two-fold over the fixed pitch propeller, in which the engine is greatly throttled: (1) The high pitch ratio obtained considerably increases the propeller efficiency; (2) by throttling only slightly, the gasoline consumption of the engine in pounds per horsepower hour is approximately as low as at full throttle. In the case of the fixed pitch propeller, however, where the engine is greatly throttled, there is considerable loss in fuel economy.

The use of variable pitch propellers will probably be essential for airplanes fitted with steam engines or steam turbines, Diesel type engines and engines with superchargers or other devices for maintaining the power at high altitudes. The difficulty encountered with the fixed propeller for this service is as follows: If the propeller is designed to operate at the normal revolutions near the ground the engine will turn it altogether too fast at high altitudes, resulting in racing the engine on account of the lower resistance of the less dense air. On the other hand, if the propeller is designed for operations at high altitudes, it will turn so slowly near the ground as to seriously impair the performance of the airplane when leaving the ground. In the case of the variable pitch propeller, it is possible to set the blades at such a pitch near the ground as to give a proper speed of revolution to the engine and to increase the pitch as higher altitudes are reached, thus preventing the engine from over-speeding.

Many destructive tests on these propellers have been made at McCook Field, and they have shown an ample factor of safety.

The method of computing the rate of retardation of the propeller when landing with and without reversible propeller and when the propeller is reversed in flight has been worked out at McCook Field.

transversal will give a set of values of  $x$ ,  $y$  and  $z$  which will satisfy the equation.

### When the Coefficients Are Negative

If we wish to form an alinement chart for

$$w = -5u + 4v,$$

there are two methods of procedure.

In the first method we consider the negative sign as being united with the variable  $u$ , so that

$$w = 5(-u) + 4v.$$

Here  $a = +5$  and  $b = +4$ , but the positive values of  $u$  must be found on  $UU'$  extended below  $U$ . That is, the same alinement chart may be used for

$$\begin{aligned} w &= 5u + 4v, & w &= -5u + 4v, \\ w &= 5u - 4v, & w &= -5u - 4v, \end{aligned}$$

if  $a$  and  $b$  are the numerical values of the coefficients of  $u$  and  $v$ , and if the positive values of a variable whose coefficient is negative are found below  $UV$ .

In this method  $WW'$  is always between  $UU'$  and  $VV'$ .

In the second method we consider the negative sign as being united with the constant, so that, if

$$w = -5u + 4v,$$

we have

$$a = -5 \text{ and } b = +4.$$

In this method the value of  $D_u$  or of  $D_v$  or of  $t$  may be negative. Fig. 1 shows the relative positions of the lines  $UU'$ ,  $VV'$  and  $WW'$  when  $a$  and  $b$  are positive; that is,  $D_u = UW$  is positive when measured from  $U$  toward  $V$ , and  $D_v = VW$  is positive when measured from  $V$  toward  $U$ . The notation in Fig. 1, and eqs. (1), (2) and (3) are applicable, not only when  $a$  and  $b$  are positive, but also when either  $a$  or  $b$  or both are negative, using the algebraic values of  $a$  and  $b$  and remembering that  $WW'$  is to the left of  $UU'$  when  $D_u$  is negative and to the right of  $VV'$  when  $D_v$  is negative, and that, if  $ra + sb$  is negative, the positive values of  $w$  are found below  $W$ .

Thus, if

$$w = -5u + 4v$$

and  $r = 20$  and  $s = 30$ , and  $m = 2$  inches, we find

$$t = ra + sb = 20(-5) + 30(4) = +20,$$

$$D_u = +12 \text{ inches and } D_v = -10 \text{ inches,}$$

so that  $WW'$  should be drawn 10 inches to the right of  $VV'$ , and 1 inch on  $WW'$  should represent 20 units in  $w$ , the positive values of  $w$  being above  $UV$ .

The two methods may be combined so that various alinement charts may be formed for the same equation. Thus we may write

$$w = 5u + 4v$$

in the form

$$w = 5u - 4(-v)$$

so that  $a = +5$  and  $b = -4$ , and the positive values of  $v$  will be found below  $UV$ . Since

$$t = 20(5) + 30(-4) = -20,$$

the positive values of  $w$  will be found below  $W$ .

### Logarithmic Scales

To form an alinement chart for

$$z = x^a y^b$$

we write

$$\log z = a \log x + b \log y$$

which is in the form

$$w = au + bv$$

if  $\log z = w$ ,  $\log x = u$  and  $\log y = v$ , and therefore, in Fig. 1, we use logarithmic scales, instead of scales of equal parts, on  $UU'$ ,  $VV'$  and  $WW'$ .

Construct a logarithmic scale on  $UU'$ , with the scale\*  $r$ , such that each distance  $UU_1$  shall equal  $\frac{1}{r} \log x$ , and mark the corresponding value of  $x$  at the point  $U_1$ . Also, construct a logarithmic scale on  $VV'$ , with the scale  $s$ , marking the points with the corresponding values of  $y$ . The notation in Fig. 1, and eqs. (1), (2) and (3) are applicable. A logarithmic scale, with the scale

$$t = ra + sb,$$

should be constructed on  $WW'$ , the points being marked with the corresponding values of  $z$ . Then a transversal  $U_1W_1V_1$  will give a set of values of  $x$ ,  $z$  and  $y$  that will satisfy the equation

$$\log z = a \log x + b \log y$$

or

$$z = x^a y^b$$

Note that the points  $U$ ,  $W$  and  $V$  will each be marked 1, since  $\log 1 = 0$ , and that the logarithms of numbers less than one are negative so that they should be found below  $UV$ .

If

$$z = cx^a y^b$$

so that

$$\log z = \log c + a \log x + b \log y,$$

we have

$$\log \frac{z}{c} = a \log x + b \log y.$$

Construct the alinement chart as before, but place unity on  $WW'$  below  $W$  at a distance corresponding to  $\log c$  on the scale

$$t = ra + sb,$$

that is, at a distance

$$\frac{1}{ra + sb} \log c.$$

When, in the equation

$$\log z = a \log x + b \log y,$$

either the coefficient of  $\log x$  or that of  $\log y$  or the coefficient of both  $\log x$  and  $\log y$  are negative, the alinement chart may be formed by methods the same as those used for

$$w = au + bv$$

but using logarithmic scales on  $UU'$ ,  $VV'$  and  $WW'$ . Thus, if

$$z = x^{1.3} y^{-2.4},$$

we may write

$$\log z = 1.3 \log x - 2.4 \log y$$

where  $w = \log z$ ,  $u = \log x$ ,  $v = \log y$ ,  $a = 1.3$ ,  $b = -2.4$ . Or we may write

$$\log z = 1.3 \log x + 2.4 (-\log y)$$

where  $a = 1.3$  and  $b = +2.4$ , the positive values of  $\log y$  being laid off below  $V$ .

If

$$z = x^m y^n$$

we have

$$\log z = m \log x + n \log y$$

which may be written in the form

$$\log z = 1 (m \log x) + 1 (n \log y),$$

so that  $w = \log z$ ,  $u = m \log x$ ,  $v = n \log y$ ,  $a = 1$ ,  $b = 1$ . Assume a value for  $x$ , compute the value of  $m \log x$ , lay off the corresponding distance from  $U$  on  $UU'$  using the scale  $r$ , and mark the point with the assumed value of  $x$ . Form the  $VV'$  scale in a similar manner. The  $WW'$  scale is a logarithmic scale with  $t = r + s$ .

\*If 4 in. on  $VV'$  represents  $\log 10 (= 1)$  then 1 in. represents  $\frac{1}{4}$  or 0.250. So that  $r = \frac{1}{4} = 0.250$ .

## The Z-Diagram

This diagram is used to obtain, without the use of logarithmic scales, the solution of the equation

$$v = ck u$$

where  $v$ ,  $k$  and  $u$  are variables.

Consider the construction of the alinement chart for

$$w = -au + bv \dots \dots \dots (4)$$

by the first method, in which the negative sign is used conjointly with  $u$ , while  $a$  is considered positive, the positive values of  $u$  being below  $U$  while the positive values of  $v$  are above  $V$ . Then, if  $UV = m$ ,

$$UW = \frac{sb}{ra + sb} m$$

and the point  $W$  is fixed, if  $a$  and  $b$  are constant quantities.

If  $w = 0$ , the transversal  $U_1V_1'$  is drawn through  $W$ , and the value of  $u$  at  $U_1$  and the value of  $v$  at  $V_1'$  satisfy the equation

$$0 = -au + bv$$

$$\text{or } v = \frac{a}{b} u.$$

Comparing this with

$$v = ck u,$$

we have

$$\frac{a}{b} = ck$$

or

$$a = bck$$

$$\text{and, therefore, } UW = \frac{s}{rck + s} m.$$

A third scale, the  $k$ -scale, may now be constructed on the line  $UV$ . Thus, if  $r = 2s$  for example, we have

$$UW = \frac{1}{2ck + 1} m.$$

Compute the values of  $UW$  corresponding to different values of  $k$ , and mark the corresponding points on  $UV$  with the proper value of  $k$ . Then a transversal through any value of  $u$ , found on  $UU'$ , and through any value of  $k$ , found on  $UV$ , will pass through the corresponding value of  $v$ , found on  $VV'$ .

## Two Straight and One Curved Scales

An alinement chart for

$$w = au + bv,$$

where  $w$ ,  $a$  and  $b$  are expressions each containing a single variable  $z$ , may be constructed as follows:

For example, let

$$z^2 = u(1+z) + v(2+z)$$

where

$$w = z^2, a = 1+z, b = 2+z.$$

Construct the  $UU'$  and  $VV'$  scales as in Fig. 1. The straight line  $WW'$  is replaced by a curve, each point on which is determined as follows: Assume a numerical value of  $z$ , compute the corresponding values of  $w$ ,  $a$  and  $b$ ; then compute the values of  $D_u$  and  $w_1$  from the formulas

$$D_u = \frac{sb}{ra + sb} m \quad \text{and} \quad w_1 = \frac{w}{ra + sb};$$

and then locate the point  $W_1$  by using these values of  $D_u$  and  $w_1$ .

Thus, if  $r = 20$  and  $s = 30$ , and if we assume  $z = 6$ , we find  $w = 36$ ,  $a = 7$ ,  $b = 8$ ,  $D_u = \frac{12}{19} m$ ,  $w_1 = \frac{9}{95}$ ; locate

the point  $W_1$  by using  $D_u = \frac{12}{19} m$  and  $w_1 = \frac{9}{95}$  of an inch;

and mark the value of  $z$  ( $= 6$ ) at  $W_1$ .

The same method may be used when any one or more of the three quantities  $w$ ,  $a$  and  $b$  is constant.

## Demonstration of Fig. 1

Let  $u'$  and  $v'$ , and  $u''$  and  $v''$ , be sets of values of  $u$  and  $v$  which, substituted in

$$w = au + bv \dots \dots \dots (a)$$

will produce the same value of  $w$ ; that is,

$$w = au' + bv' \dots \dots \dots (b')$$

$$w = au'' + bv'' \dots \dots \dots (b'')$$

On  $UU'$  (Fig. 3) lay off

$$UU_1 = u_1 = \frac{u'}{r} \quad \text{and} \quad UU_2 = u_2 = \frac{u''}{r} \dots \dots \dots (c)$$

since one inch on  $UU'$  represents  $r$  units in  $u$ ; and on  $VV'$  lay off

$$VV_1 = v_1 = \frac{v'}{s} \quad \text{and} \quad VV_2 = v_2 = \frac{v''}{s} \dots \dots \dots (d)$$

since one inch on  $VV'$  represents  $s$  units in  $v$ .

We wish to find the point  $W_1$  where the straight lines  $U_1V_1$  and  $U_2V_2$  intersect.

Considering the line  $U_1V_1$ , we have

$$WW_1 = u_1 + \frac{v_1 - u_1}{m} UW \dots \dots \dots (e)$$

Considering the line  $U_2V_2$ , we have

$$WW_1 = u_2 + \frac{v_2 - u_2}{m} UW \dots \dots \dots (f)$$

$$\therefore u_1 + \frac{v_1 - u_1}{m} UW = u_2 + \frac{v_2 - u_2}{m} UW$$

$$UW = \frac{(u_2 - u_1)m}{v_1 - v_2 - (u_1 - u_2)} = \frac{s(u'' - u')m}{r(v' - v'') - s(u' - u'')}$$

But, subtracting  $(b'')$  from  $(b')$ ,

$$v' - v'' = -\frac{a}{b}(u' - u'')$$

$$\text{and } \therefore UW = \frac{sb}{ra + sb} m \dots \dots \dots (g)$$

Then, from  $(e)$ ,

$$WW_1 = \frac{u'}{r} + \frac{rv' - su'}{rs} \frac{sb}{ra + sb} = \frac{au' + bv'}{ra + sb} = \frac{w}{ra + sb} \dots \dots \dots (h)$$

If  $u'''$  and  $v'''$  is any other set of values of  $u$  and  $v$  which, substituted in equation  $(a)$ , will produce the same value of  $w$ , so that

$$w = au''' + bv''',$$

and if  $UU_3 = u_3 = \frac{u'''}{r}$  and  $VV_3 = v_3 = \frac{v'''}{s}$ , the line  $U_3V_3$

will pass through the point  $W_1$ ; for the distance from  $W$  to the point where  $U_3V_3$  intersects  $WW'$  is

$$u_3 - \frac{u_3 - v_3}{m} UW = \frac{u'''}{r} - \frac{su''' - rv'''}{rs} \frac{sb}{ra + sb} \\ = \frac{au''' + bv'''}{ra + sb} = \frac{w}{ra + sb}$$

as before.

From equation  $(g)$  we see that  $UW$  is a constant, so that the point  $W_1$  must be on a line  $WW'$  parallel to  $UU'$  and  $VV'$ , and from equation  $(h)$  we see that  $WW_1$  depends upon the value of  $w$  and not upon the values of  $u$  and  $v$ .

## Alinement Chart for Helical Springs

The accompanying alinement chart was designed to determine the diameter of the wire and the mean diameter of the coil of a helical spring formed of round steel wire, if the amount of compression or extension, the maximum load and the solid height are given, and to determine the extreme fiber stress under that load.

The formulas for helical springs made of round wire are

$$P = \frac{\pi S d^3}{8 D} \dots \dots \dots (5)$$

ALINEMENT CHART FOR HELICAL SPRINGS

shall be placed near each other. The results of the several operations are:

$$(a) \log \frac{P}{100} + \log \frac{8h}{10} = \log I_1;$$

$$\therefore I_1 = \frac{8hP}{1000}$$

$$(b) \log I_1 - \log F = \log I_2;$$

$$\therefore I_2 = \frac{8hP}{1000F}$$

$$(c) \log \frac{10G}{1,000,000} - \log I_2 = \log I_3;$$

$$\therefore I_3 = \frac{FG}{800hP}$$

$$(d) \log \frac{1}{d^2} - \log I_3 = \log \frac{100}{D^2};$$

$$\therefore \frac{8hP}{FGd^2} = \frac{1}{D^2}$$

which is one form of Eq. (6).

$$(e) \log \frac{P}{100} + \log \frac{8D}{10} = \log I_4;$$

$$\therefore I_4 = \frac{8PD}{1000}$$

$$(f) \log I_4 - \log \frac{100\pi d^2}{8}$$

$$= \log \frac{8S}{100,000};$$

$$\therefore \frac{8PD}{\pi d^2} = S$$

which is one form of Eq. (5).

$$(g) \log \frac{10G}{1,000,000} - \log \frac{P}{100} = \log I_5;$$

$$\therefore I_5 = \frac{G}{1000P}$$

$$(h) \log \frac{1}{d^2} - \log I_5 = \log I_6;$$

$$\therefore I_6 = \frac{1000P}{Gd^2}$$

$$(i) \log I_6 + \log \frac{8h}{10} = \log I_7;$$

$$\therefore I_7 = \frac{800hP}{Gd^2}$$

$$(j) \log I_7 - \log \frac{100}{D^2} = \log F;$$

$$\therefore \frac{8hPD^2}{Gd^2} = F$$

which is one form of Eq. (6).

## Heat Treatment of Molybdenum Steel

A REPORT of tests of heat-treated carbon-molybdenum and chromium-molybdenum steels has been completed by the Bureau of Standards.

Among the conclusions reached regarding steel containing 0.20 per cent carbon and 1 per cent molybdenum are the following: For the production of definite tensile strength, water quenching is to be preferred on account of the higher proportional limit, ductility and impact values obtained, and, conversely, better tensile properties are obtained for a given impact resistance.

Raising the quenching temperature from 1670 deg. Fahr. to 1795 deg. Fahr. does not materially alter the mechanical properties of the steel when subsequently

tempered at a relatively high temperature, 1000 deg. Fahr.

In normalizing steel containing 0.27 per cent carbon, 0.9 chromium and 0.5 molybdenum a low limit of proportionality and impact resistance are obtained when using temperatures between about 1450 to 1550 deg. Fahr.

The fact that no material changes in tensile or impact properties are produced by oil quenching the chromium-molybdenum steel from a wide range of temperatures when subsequently tempered at 1000 deg. Fahr. has been confirmed. To produce high impact values in the hardened steel, a tempering temperature in the neighborhood of 1200 deg. Fahr. is required.

# Production of Heavy Truck Banjo-Type Rear Axle Forgings

Working to close tolerances on an exceptionally large forging necessitates unusually large tools and careful heat treating methods. This article describes the machining and heat treating operations employed in making one of the largest drop forgings used in automotive production. Rough forging removes one hundred and fifteen pounds of stock

By Herbert Chase

**W**HAT is believed to be the largest drop-forging used in regular production in the automotive industry is the banjo-type rear axle produced in the Allentown plant of the International Motor Co. and used in the Mack Model AB dual reduction truck. It is a drop forging of chrome-nickel steel, 71½ in. long and 16⅜ in. wide at the center of the banjo, and weighs in the rough about 300 lb.

## Machining Operations

The machining of so large a forging to close limits presents some interesting problems. The forging is heat treated between certain of the machining operations. To straighten it after this treatment requires a 150-ton hydraulic press. Some of the tools used are larger than are ordinarily employed in automotive work. When finished the axle weighs about 185 lb. but is quite light for an axle suited for use in a 2½-ton truck, and is unusually strong because of the high-grade material used. In the accompanying drawing will be found the dimensions of both the rough and the finished forging, together with the tolerances allowed in machining.

The drop forging concerns who furnish the rough forging are given an option of two materials having identical physical properties. The chemical properties of the two materials are:

Alloying Ingredients	Chrome Nickel Steel	3½% Nickel Steel
Carbon .....	0.45 per cent	0.45 per cent
Manganese .....	0.60 per cent	0.60 per cent
Nickel .....	2.00 per cent	3.50 per cent
Chromium .....	0.75 per cent	.....

The physical properties of both materials are:

Tensile strength .....	130,000 lb. per sq. in.
Elastic limit .....	110,000 lb. per sq. in.
Elongation .....	17 per cent
Reduction of area .....	45 per cent
Brinell hardness .....	280 maximum
Forging heat .....	2,200 deg. Fahr.

The forging is furnished annealed by the vendor, and must have a maximum Brinell hardness of 280.

In the first machining operation both ends of the forging are cut off simultaneously by hacksaws set in position to give the desired length. This is not a rapid operation but is in step with other operations. The disks cut off by this means are used for test specimens to check analysis and hardness of the steel.

In the second operation the piece is laid in V-blocks and is gaged roughly to determine whether the metal of the forging is so disposed as to be properly cleaned up in the machining operations. This involves checking the

angle between the plane of the banjo and the plane of the spring seat. While the piece is in this position centers are drilled in each end.

The third machining operation consists in rough turning the outside ends of the tubular portion (now solid). The piece is mounted on lathe centers but is held rigid by the use of a heavy conical casting, the large end of which is bolted to the face plate of the lathe, and the center to the banjo of the axle. When one end has been turned, the piece is reversed and the same operation repeated on the other end. Between this and most of the succeeding operations, the forgings are handled by overhead air hoists on trolleys or cranes.

The fourth operation is accomplished on a Bullard Maxi-Mill (Fig. 1). This vertical boring machine is a 61-in. special type provided with a table about 7 ft. in diameter, a portion of the vertical guides on this machine having been cut away to permit the use of a table large enough to accommodate the full-length axle. In this operation the bore of the banjo and the banjo faces are rough turned, 1/16 in. (⅜ in. diameter) is left for the later finishing operations.

A battery of four Lodge and Shipley 22-in. lathes with long bed, especially rigged for deep drilling, are used for the fifth operation. The work is clamped in a special chuck fixture (See Fig. 2) at one end while the outer end is supported in a steady rest. As the work turns a gun drill, made especially for the purpose and held stationary in a support rest, is fed into the axis of the work with a feed of 9/16 in. per minute. The drill bar or shank is provided with two countersunk brass tubes which terminate in holes drilled in the cutter. Lard oil under 200 lb. pressure is led through these to the cutting edge, and is instrumental in forcing the chips out of the hole. The hole is finished in one operation to 2-1/32 in. dia. The hole is nearly 24 in. long.

## Heat Treatment Principally on Ends

Following this operation, the forgings are taken to the heat-treating room and given a heat treatment, the purpose of which is to remove internal stresses and bring the spindles and outer threaded ends to the required hardness. This treatment is principally on the ends, but is said to improve the structure of the banjo portion to some extent. Each end is raised to a temperature of 1500 deg. F. in a special twin type oil-burning furnace and then quenched in oil. In this quench the axle is suspended vertically to lessen the tendency to warp and distort. This method is commonly employed in heat-treating large guns.

## Various Milling Operations

Fig. 1—This Bullard Max-I-Mill effects the rough turning process. Fig. 2—A special chuck fixture clamps the work for drilling. Fig. 3—Internal stresses in the axles are brought out by this heat treatment. Fig. 4—Another view of the heating process. Fig. 5—A 150-ton hydraulic press straightens the axles. Fig. 6—The Max-I-Mill is again shown as it is used in other operations. Fig. 7—Milling the bottom of the spring pad

After quenching one end the other end is placed in the furnace and the same treatment given it. When both ends have received this initial treatment, they are in turn re-heated to 1150 deg. F., to temper.

A view of the axles undergoing heat treatment is shown in Figs. 3 and 4. After heat treatment, the axles are tested for hardness which is held between 260 and 290 Brinell. They are then placed in V-blocks under a 150-ton hydraulic press, shown in Fig. 5, where they are straightened until a test bar, 0.010 in. smaller than hole, can be passed through bore from end to end of axle.

The forgings are then returned to the machine shop where they undergo the sixth machining operation accomplished on a standard American 24-in. lathe with 16-ft. bed. This operation consists of counterboring the axle ends to 2½ in. diameter and a depth of 1⅜ in., and threading the ends on the outside to receive the locking collar. The tail stock of the lathe is used to carry a cutter which counterbores and faces the axle end in one operation. The outside turning and threading are accomplished by four tools carried in a special turret made up for the purpose.

The seventh machining operation consists in turning the outside of the axle spindle and the radius at its inner end. This spindle fits the inner race of the Timken bearings and is held within limits of 2.9995 and 2.9990 in. Prior to this operation, which is accomplished on a LeBlond heavy lathe, the axle is provided with special expanding centers which fit into the counterbore at each end, and is stiffened by heavy steel bars bolted to each side across the faces of the banjo.

The work is returned to the Max-i-Mill, for the eighth machining operation shown in Fig. 6. It is carefully located in the fixture shown after which the following operations are performed simultaneously or in sequence.

1. Turn finishing cut on inside diameter of banjo.
2. Face both sides of banjo in fixed relation to the finishing cut on the spindle.

3. Counterbore banjo to receive carrier flange. This counterbore is held within the limits, 14.502, and 14.499, and is checked by snap and pin gages.

**4. Chamfer entering edge of carrier counterbore.**

The ninth machine operation is accomplished on a No. 5 Cincinnati milling machine. This consists in milling the bottom of the spring pad in fixed angular relation to the finished faces of the banjo. (See Fig. 7.) In this operation the work is held in V-blocks with pin contacts, and the face of the banjo is held in contact with a pin so located as to give the desired angular position. When the bottom of one spring pad has been machined, the piece is reversed for machining the other pad.

The tenth operation consists in milling the keyway through the threaded portion at each end of the axle. This operation is also accomplished on a No. 5 Cincinnati milling machine.

The eleventh operation consists in drilling the spring pads, using a special jig and supporting fixture.

The twelfth operation consists in drilling, counter-boring and tapping four holes in banjo for shouldered through studs to fasten carrier.

The final operation consists in trimming the external surface of the axle by use of a portable emery wheel, and hand cleaning to remove burrs, etc. Following this, the finished piece is carefully checked by special gages, as to bore of banjo, alignment of bore through spindles, diameter of spindles, and angular relation between the faces of spring seats and faces of banjo. The distance between the axis of the piece and the faces of the banjo and spring pads is also checked.

From the dimensions given on the drawing, it will be seen that the tolerances maintained are unusually close for so large a piece.

**A** FURTHER step in the movement toward the standardization of automobile, motorcycle and cycle parts has been taken by the British Engineering Standards Association in the formation of seven sub-committees to undertake the following sections of the work: Nomenclature, steels, small fittings, electrical fittings, shafts and shaft details; wheels, rims and tires, and cast iron. Technical data in regard to the specific subjects to be taken in hand immediately are being collected.

# Developing a Ground Organization for Civil Aviation

## Part II

In this final article, Mr. Bradley points out that the success of commercial aviation in France rests entirely upon the system of government subsidies which has been established. He discusses these and brings out points vital to a consideration of development in the United States.

By W. F. Bradley

**A**LL the commercial aviation lines operating in France at the present time have been created and are maintained in operation by reason of a system of Government subsidies granted to the aerial navigation companies. Half the purchase price of approved types of machines is paid by the State on condition that the owners maintain them constantly in flying condition and fill all the clauses of a well-defined contract.

In addition to the purchase subsidy, public service lines receive special subsidies based on hours of flight and on commercial efficiency. Until recently the subsidies were granted whenever a flight was made under the stipulated conditions, without any consideration of the useful load carried, and were thus an encouragement to fly in ballast. Such an arrangement could only be temporary, but it had its value, for it assured the regularity of trips from point to point even when there were no passengers or freight to be carried, and proved to the public that the airplane could be relied on for regular service.

At the present time the commercial subsidy is only granted when passengers or freight are carried, and when the journey is completely accomplished. If a plane sets out for a given point and has to abandon the trip a few miles from the end, the subsidy for that flight is lost. Also if an average speed of 80 miles an hour is not maintained, no subsidy is paid. When weather conditions are very unfavorable, the subsidy can be granted, on the recommendation of the competent authorities, if the flight shows a gain of 25 per cent on the fastest public service by train or steamer. The chief of the State aerodrome decides whether weather conditions are or are not suitable, and should his decision be in favor of a start and the plane does not leave, the subsidy is lost. Also, if there is a delay at the start, after weather conditions have been pronounced satisfactory, the subsidy is reduced 5 per cent for each quarter hour, or fraction thereof.

### Commercial Subsidies

The French commercial subsidy is 75 centimes a kilometer per passenger, and .005 centimes per kilo of freight carried at a scale of charges approved by the State. Fares are fixed at 80 centimes per kilometer per passenger, while the freight charges must be .015 centimes per kilogram-kilometer. Under this scale of charges the cost of an aerial trip from Paris to London, or Paris to Amsterdam, is 300 francs, or considered at nominal exchange 26 cents a mile. If the present actual value of the dollar is taken into consideration, a long-distance flight in Eu-

rope costs slightly less than 10 cents a mile. The rates now in operation are practically the same as first class fares on the railroad and steamship routes. There is no difference at all if the fact is taken into consideration that the aerial navigation companies pick the traveler up at his hotel in Paris and land him at the door of his hotel in London for the inclusive charge of 300 francs. By the more old-fashioned method of travel taxicab fares have to be paid at each end of the journey, and a certain amount has to be given away in tips at the railroad station and when changing from train to steamer and vice-versa.

### Regularity Encouraged

By reason of the high subsidies offered by the French Government, British firms operating on the London-Paris line have been seriously affected, and for a time all of them abandoned. More recently the Handley-Page Co. has resumed operations, but they undoubtedly are working at a loss in competition with the French. Although they have the advantage of a high subsidy, French firms declare that they are making little money, but there is no doubt that the regularity and the reliability of the airplane having been proved the public will travel by air in far greater numbers, now that the cost is practically the same as by the railroad.

It is recognized that regularity of operation must be encouraged by all possible means, and because of this an additional subsidy is granted when the proportion of trips successfully accomplished is high, and deductions are made when the percentage is low. Regularity is determined by the relation between the number of trips for which the subsidy is paid and the number on the program, the coefficient of variation being equal to the resultant expressed in hundreds, increased by 30 hundredths for the month of December and by 20 hundredths for the other months. As examples, if the regularity is 80 to 100, the coefficient becomes  $100-100 = 1$ , and there is no change in the subsidy. With a regularity of 90-100 the coefficient is 110-100, giving an increase of one-tenth in the subsidy. With a regularity of 60-100, the coefficient is 80-100, corresponding to a reduction of  $2/10$  in the subsidy paid.

In addition to this trip or commercial subsidy of 75 centimes a kilometer per passenger, there is an additional hourly subsidy made up of the four elements, as follows: Amortissement subsidy, crew subsidy, transport subsidy, and gasoline subsidy. For the amortissement the life of a plane is calculated at 200 hours' actual flight, and the price of the machine having been fixed by contract,

the formula becomes:

$$\frac{P \div 1.5}{200}$$

As half the cost of the plane has been paid by the State at the time of purchase, the amortissement subsidy paid by the Government is half the amount found by the above formula.

The crew subsidy is found by the formula

$$0.10 E m \div \frac{n HP}{2} \text{ francs,}$$

in which  $E m$  is the length of the average flight, or when a flight is made in several stages the total distance divided by the number of stages.

The transport subsidy is found by the formula:

$$\frac{K}{1000} V^3 T$$

in which  $V$  is the official speed in kilometers of the plane at an altitude of 6500 ft.,  $T$  the tonnage of the plane after deduction of the weight of the crew, navigating instruments, weight of fuel necessary to maintain a ceiling of 13,000 ft. after one hour's flight, and to cover a distance of 300 miles with a head wind of 10 meters per second.  $K$  is a coefficient which varies from 11 for regular journeys of 125 miles to 19 for trips of 620 miles.

The gasoline subsidy is determined for fixed cylinder engines by the formula:

$$n HP \times \frac{0.250}{0.65} \times \frac{p}{2}$$

in which  $n HP$  equals the number of horsepower, and  $p$  the price of gasoline in liters, this price being determined at the beginning of every quarter. For rotary engines the formula is:

$$n HP \times \frac{0.320}{0.65} \times \frac{p}{2}$$

The object of the subsidy system being the development of French aviation, all foreign elements are eliminated. The president and at least two-thirds of the directors of the subsidized company must be of French nationality; all the planes and engines must be of French design and construction, and the pilots and mechanics must be French citizens, and possess French Government licenses.

### Material Control

A rigorous control is maintained over all the material. No plane can go into service unless it has been approved by the Technical Department of the Air Service; it must constantly be maintained in good flying condition, and after 200 hours' flight it must either be scrapped or entirely rebuilt. A certain amount of discretion is displayed in the application of this latter rule, for a plane may have been maintained in such excellent condition that its life is far from ended after 200 hours in the air. The subsidy, however, for that machine is never continued unless the Technical Department has pronounced favorably on its condition after overhauling, and every three months, or every 50 hours of flight after the first 200 it must be submitted for thorough technical examination.

For engines the normal life is estimated at 100 hours' operation, but here again it is possible for the maintenance to have been undertaken in such a thorough manner that at the end of the hundred hours few of the original parts are left and the engine is in as good a condition as when it went into service. Every month detail reports showing the state of planes and engines, and indicating the work done on them, have to be submitted to the Aerial Navigation Service. Similar reports have to be supplied concerning the flying and mechanical staffs.

Aerial navigation companies must maintain a minimum of one pilot for three planes and at least one mechanic per 300 hp. For any given line the minimum number of planes which must be maintained by the operating company is determined by dividing the total number of hours of flight figuring on the program for the year by 200 and multiplying by 2. The average commercial speed must not be less than 80 miles an hour. Number of planes = 
$$\frac{2 \times \text{daily flights in hours} \times \text{number of days' service}}{200}$$

For a service such as that from Paris to London, the program of which may call for operation 300 days in the year, a minimum of nine planes would have to be maintained by the subsidized company. The general rule regarding the frequency of trips is that a daily service must be maintained when the distance covered is less than 150 miles from the French frontier, and at least three times a week for Northern African and other international lines running at least 150 miles from the French frontier.

### Penalties

While the entire system under which subsidies are granted tends toward regularity of operation, the State imposes penalties when regularity is not kept up to a certain standard. Thus if for any cause the irregularity falls for two consecutive months below 40 per cent during December to March, and below 50 per cent for any other months of the year, the subsidies are suspended until the regularity has risen to more than 40 per cent in the first case and more than 50 per cent in the second case. A period of two months is allowed to re-establish the service on this basis, and if the improvement is not made within this time the subsidy is permanently withdrawn.

The main subsidy is now granted on the number of passengers, or the quantity of freight carried, and not on trips made light or in ballast. But in addition to this the subsidy is suspended if during three consecutive months the number of paying passengers or the quantity of paid freight is less than 30 per cent of the capacity of the planes in service. The subsidy is not given again until the commercial efficiency has risen to at least 30 per cent of capacity.

The end of the war found France with an immense number of aviation grounds, few of which were suitable for commercial services. For military operations the grounds had to be immediately in the rear of the armies, and were therefore most plentiful in the north and the east. There were no aviation routes, as they are understood now, for all flights were from the rear of the Allied armies to the German front line or to points in Germany.

As a consequence, France derived little material benefit from the aerodromes bequeathed to her during the war, and in the great majority of cases these grounds have been given back to their original owners. There are a few exceptions, such as the American Air Service reception and dispatching ground at Orly, near Paris, which has been taken over by the Aerial Navigation Service and is being equipped as an airship port. Commercial value can only be derived from landing grounds when they are placed on an important line of flight. While local authorities should be encouraged to help in the development of aviation ground organization, and can assist considerably by the gift of land in the neighborhood of important centers, there is not much to be gained by mere groups of grounds.

At the present time France possesses about thirty State owned and controlled aviation grounds, and about twenty privately owned aerodromes. These figures, however, are not any real indication of the value of the grounds to commercial aviation, for a string of equally spaced landing

grounds between Paris and London, or between Paris and Brussels, can be of infinitely greater value than a big grouping of grounds around Bordeaux or near the Spanish frontier.

Last year the total distance covered by public service planes operating under the control of the French Aerial Navigation Service was 1,203,565 miles. This figure comprises flights with passengers or merchandise accomplished according to schedule. No military flights, demonstration trips, tests, or private journeys are included.

#### Passenger Service

The greatest volume of traffic was, and still is, between Paris and London, over a country which is most unfavorable for flying, for it is adversely affected by fog, and comprises the crossing of the English Channel. The effect of fog is shown by a comparison of the number of trips made between England and France during the winters of 1919-1920 and 1920-1921. The past winter was exceptionally mild, with an almost entire absence of violent storms, but as a considerable amount of fog prevailed, the regularity of the service was much more affected than during the wild and severe winter of 1919-1920. There is no doubt that given the ground and general organization existing on the Paris-London line very much better results would be obtainable in the United States by reason of the more favorable climatic conditions.

To develop a passenger-carrying service, freedom from accident is essential, with regularity as an important but secondary consideration. For a freight service regularity is of primary importance.

The degree to which these two requirements have been obtained is shown by the official returns for the public service lines under the control of the French Aerial Navigation Service. For the years 1919 and 1920, when the mileage covered by public service planes was 1,203,565, with a total of 6697 passengers, the number of fatal accidents was fourteen, or one person killed per 85,973 miles flown. Merely as a matter of comparison it can be noted that for a period of twelve months, including a portion of the time mentioned above, the distance covered was 1,148,188 miles and 15,697 passengers carried with fifteen deaths, giving one person killed for a distance of 76,545 miles. During this latter period passenger traffic has increased enormously, and although the number of accidents per mile is higher, the proportion of passengers killed is much lower.

In arriving at the figure of one person killed for every 85,973 miles flown, it should be noted that no advantage has been taken of such trips as the trans-Atlantic flights, the Farman flight from Paris to Northern Africa, and large numbers of other European sporting and demonstration events, all of which were accomplished without a fatal accident. These figures are important, for they are the first of their kind covering aviation on a commercial basis. Insurance companies up to the present have shown very little confidence in aviation, and have always insisted on very high premiums being paid. Undoubtedly this is owing to the fact that all the figures they have obtained on aviation accidents have dealt with, or comprised, military and demonstration or stunt flying, which are entirely foreign to commercial aviation.

#### Freight Carrying

The increase in the amount of freight carried on the Paris-London line is remarkable, the figures jumping from 31,040 pounds in 1919 to 271,720 pounds in 1920. The great proportion of this was from Paris to London, only a comparatively small amount coming from England to France. There are two reasons for this. Paris manufactures quantities of high-grade and costly articles which can bear the increased cost of transportation by airplane.

As examples, dresses, hats, jewelry, fancy goods, and small automobile parts are shipped regularly by airplane from Paris to London, but there is comparatively little traffic of these goods in the opposite direction.

Another reason for the heavier traffic Londonward is the better publicity carried out in France. Instead of merely advertising the airplane service in a general way, as is done in England, the commercial departments of the French aerial navigation companies circularized all the big stores, all the high-class milliners, dressmakers and jewelers, and in many cases paid personal visits and pointed out the great advantages to be derived from shipping goods by airplane instead of by train and steamer. The dispatching departments were induced to make a trial, and in nearly every case it soon became common practice to prefer the airplane for urgent deliveries. In the matter of mail, the bulk of the traffic is from London to Paris, but this is owing to the fact that the rates are much lower from London than in the opposite direction.

In addition to the commercial lines from Paris to the north and northeast, there is another important line, of an entirely different nature, from Toulouse in the south of France to Casablanca in Northern Africa. Here the amount of traffic is light, but the ordinary means of locomotion are so defective that the airplane has really no competition from train and steamer. The distance from Toulouse to Casablanca is 1150 miles, and by airplane can be covered in 13 hours' flight, or in two days' elapsed time, for the journey is made in four stages and there is no night flying. This compares with seven to eight days by the fastest boat and train service. This route, unlike those in Northern France, is entirely free from fog, and is not often affected by storms.

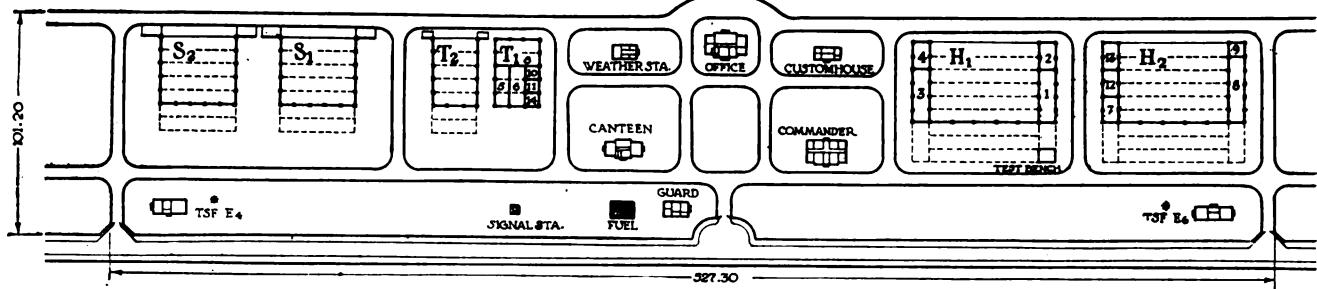

#### An Important Line

It covers only a slight distance over French territory, has been established by the Latecoere Co. and is operated entirely by them, under the French subsidy system, but without the use of French Government landing grounds. French military grounds are used in Africa. The line of flight follows the Spanish coast to Gibraltar, then cuts across the Mediterranean to Tangiers, and follows the northern African coast as far as Casablanca. As the French Aerial Navigation Service cannot establish landing grounds outside its own territory, this work has been taken up by the Latecoere Co., and emergency grounds have been laid out at intervals of 60 miles along the entire route. The journey is made in four stages: Toulouse to Barcelona, Barcelona to Alicante, Alicante to Malaga, and Malaga to Casablanca, the average length of the stages being a little less than 300 miles. By following the coast line for the entire distance all difficulties regarding the route are avoided, and there is also the advantage that in addition to the 60-mile emergency landing grounds the pilots can bring their machines down on the sea shore in case of absolute necessity. These landings, of course, are not recommended, for it is difficult to get away again from the sand, but their possibility offers a guarantee against serious accidents. Because of these specially favorable conditions, compared with the more northerly lines, the Latecoere Co. was able during a whole year to maintain a regularity of 97 per cent. Only 3 per cent of the trips were not accomplished or were not finished within the time limit necessary to get the Government trip subsidy.

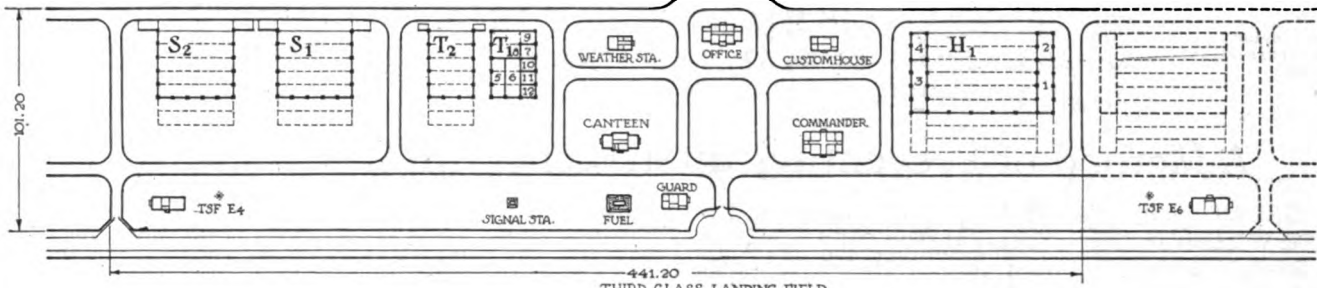

Machines used on this route are the Breguet 14 A2 and the Salmson Corps d'Armée type, the former being fitted with the Renault engine and the latter with the Salmson star-type water-cooled engine. These machines have been modified for commercial purposes and carry two passengers, mails and freight, with a fuel supply for four hours' flying.

The size of the weather station varies with the field; information can be obtained from the Weather Bureau.

either direction every week, the company has to maintain a fleet of eighty planes in order to assure a regular service. At least ten planes are always kept in reserve at the three intermediate stations between Toulouse and Casablanca in order to assure a regular service in case of mechanical failure or breakdown. Established on Sept. 1, 1919, this company had flown 435,000 miles by the end of February, 1921, and carried 12,000 passengers.

## A Method of Preventing Interference in Worm Gearing\*

A GREAT many manufacturers mill hobs on Pratt & Whitney or Lees-Bradner thread millers, which do not produce a straight sided thread, the curve varying with both the helix angle and the diameter of the milling cutters. If this hob is relieved by any method that leaves the curve on the side of the thread as it was milled; if you proceed to hob gears with it, and your customer then cuts the mating worms with a single point tool in a lathe when the worm gears are installed they are going to give trouble, and complaints will come in that the sets heat up and cut and are noisy, simply because the teeth in the gear and worm do not conform.

To verify the truth of this statement, hob a worm gear with the curve on the side of the tooth of the hob, and mesh it with a worm produced with a single point tooth on a lathe, mounting this pair in any fixture that will give the correct centers. You will find them to be noisy and to give poor tooth contact. To determine just how much it takes to correct them, take this same worm and let a man who can score the sides of the teeth in file form, put the worm back and run it into the worm gear, and it will surprise you to see the amount of iron dust that will pile up under this worm and gear on the table of your testing machine.

Some manufacturers claim to get fairly good results from a fly tool used on machines geared up to pass a fly tool through the periphery of the teeth, but I am frank to say that we have never gotten a worm gear from this method that was not a series of very pronounced flats. This leads me up to observations made in a number of experiments and tests which were more or less contrary to standard practice. The latter in my estimation does not give as good results as I have obtained by making the pitch diameter equal to 0.99, its correct theoretical value, or by cutting one tooth more in about 50.

In a worm and gear, of which the gear blank is cut with one more tooth in 50, there would be interference at the corner of the worm tooth from the pitch line down to the root of the tooth if it were not that the hob had removed or under-cut the tooth. Part of this interference is caused by the worm or hob being of greater linear pitch than the worm gear, but on the adjacent tooth this interference would have been less, and on the third tooth there would have been very little interference. This cut away or under-cut from the pitch line down is what is wanted, as it keeps the mating worm and gear from rubbing at this point when the worm and gear are first meshed, with the result that the bearing or contact of the worm is of double involute shape from the center of the

gear outward. That is, the contact is thrown down to the bottom of the worm tooth, which is the most efficient point of contact as regards rubbing or frictional loss.

In addition to this central contact a contact is obtained at the very points of the teeth, which soon wear into involute shape. This contact is obtained in a few minutes of running without abrasive material.

With the slight amount of metal removed below the pitch line by the under-cutting process just spoken of, the surfaces are so close together that it is only a short time until perfect contact is obtained on the whole tooth, whereas in a worm gear with a theoretically correct pitch diameter, excessive pressure occurs below the pitch line in the center of the gear and at the two points of the tooth.

This being so radical a departure from former practice and theories I would have been loath to go into this explanation had it not been for the fact that all our customers who gave the method a fair trial obtained better results than with the old method. This method was first brought to my attention through a gentleman by the name of Voltaire. We made quite a number of tests and have as a result adopted this method in all of our own worms and gears that we market for sale in sets.

## Economic Aspects of Great Lakes-St. Lawrence Ship Channel

THE proximity to the Great Lakes of a great part of the automotive industry has made the Great Lakes-St. Lawrence Ship Channel of special interest to such manufacturers. High freight rates and freight congestion during peak production times are other factors which have led automotive manufacturers to scrutinize carefully the various phases of this much-discussed waterway project.

The economic aspects of the Great Lakes-St. Lawrence Ship Channel are discussed in a practical and interesting way by Roy S. MacElwee and Alfred H. Ritter in a volume recently published by the Ronald Press Co. The book is entitled "Great Lakes-St. Lawrence Ship Channel," and comprises a detailed study of the present transportation situation, especially as related to this proposed waterway. The book is a result of a careful and practical survey of the entire situation made by the authors and takes up such matters as the cost of transportation between upper lake ports and Liverpool, production in the territory tributary to the Channel, comparison of navigation facilities on the Great Lakes with those of ocean ports, the problem of return loads, the volume of commerce affected by the Channel, etc.

# The Motor Bus Field as a Market for Trucks

There is undoubtedly a large field for the development of the motor bus in the United States. How far this method of transportation can be developed and the means to hasten its growth can be determined only after careful analysis. This article is of interest because it gives the opinion of one man who has visualized the possibilities of the field.

**I**N discussing potential truck markets, there is a necessity for visualizing the possibilities of motor bus development in this country. After this general picture has been obtained, a careful study of the more detailed phases of the market, together with constructive help in the development of motor bus travel, will aid materially in selling trucks to this field.

Certain fundamentals underlie the development of the bus market. These relate to the type of chassis construction, the adaptability of the truck unit to the special type of transportation for which it is to be used, and other similar factors. A few companies have studied these problems carefully, but they are still far from being fully solved. Truck manufacturers may well profit by more extensive research into the engineering and merchandising problems involved in the motor bus field, as the possible growth of such transportation is not yet conceived in many quarters.

Because of the importance of this potential market for the truck, the remarks recently made by a prominent truck axle manufacturer are of special interest at this time. Ezra W. Clark, at the recent M.A.M.A. credit convention, outlined briefly some of the problems underlying the motor bus problem and indicated the certain lines of probable development. While some of the conclusions drawn may be a trifle too optimistic as regards the immediate future, the general trend is undoubtedly along the lines indicated. Before the market can be developed to a high degree, however, considerable sales effort and analysis will be necessary. Mr. Clark said in part:

## Special Bus Chassis

It was only a few years ago that a very large percentage of the motor trucks in use were, in reality, but converted passenger car chassis. The use of these converted motor trucks soon developed two facts: First—that the world needed motor trucks. Second—that a passenger chassis could not be made to do double duty in the specialized field of freight transportation.

Today a very large percentage of motor buses used in America are built on regular truck chassis. The use of these converted motor buses has developed two facts: First—that America needs motor buses. Second—that converted motor truck chassis cannot be made to do double duty in the specialized field of commercial passenger transportation.

Opportunity and ability constitute duty. America needs motor buses. The motor truck industry of America has the ability to produce motor buses and the fulfillment of this obligation will bring the automotive industry under the approving eyes of the nation. Doing a worth while

thing well will establish our industry in the good will of public opinion.

The population of the United States increases approximately 20 per cent every ten years. It has increased from 75,000,000 in 1900 to 105,000,000 in 1920, of which a disproportionate percentage has occurred in the cities. Urban population is increasing at the rate of 34.9 per cent as compared with 11.1 per cent in rural districts. The burden of transporting the immense armies of city workers to and from their homes each day has fallen, in the main, upon the trolley systems of America. New York, Chicago, Boston and Philadelphia have supplemented the trolley with elevated lines and subways. (Chicago's subway designed but not constructed.) Trolley building has almost ceased in America.

The cessation of trolley construction has been due to the increasing costs of construction and the growth of the automobile as a passenger carrying vehicle. This new unit of transportation has supplemented existing transportation systems and by reason of its speed and flexibility, has greatly enlarged the residential sections of all our cities.

## "Jitney" Service Usually Unprofitable

Sporadic outbreaks of "jitneys" in various cities, show the possibilities of motorized passenger transportation—these epidemics have also shown the fallacy of trying to operate high-powered, small capacity passenger automobiles at a profit. The public has been educated at the expense of the "jitney" owners and operators.

The growth and development of most cities has radiated from their business sections along fixed lines of transportation so that in many cities "outlying" and "neighborhood" business and recreation centers have grown up with startling rapidity.

An analysis of the transportation facilities of any of our cities, in view of these facts, will show a wonderful opportunity now open to improve the present systems with motor bus lines. These may be operated by and in conjunction with the present trolley systems or by independent companies over routes laid out by city authorities so as to bring the wage earners of the cities into close touch with their places of employment and recreation.

The quickest, most convenient and most comfortable way in which the present transportation systems of our cities can be supplemented and enlarged, is by the development and use of the motor bus. An exhibition of the successful operation of motor bus lines in some of our larger cities indicates that this phase of city life will see a marvelous and stupendous growth in the next few years.

Specialized work requires specialized equipment. The

character of service required should govern the design and construction of motor vehicle used for the commercial transportation of passengers. Eliminating the automobile and taxi-cab, motorized passenger vehicles may be divided into the following four classifications:

### Types of Bus

The development of the automobile has made rather startling changes in the systems of rural education. The isolated "little red school house" is being abandoned in favor of larger consolidated schools in the center of rural population. This evolution means larger and better schools with a consequent raising of the standards of instruction. School buses operated by townships and school districts, make regular runs, bringing the children to the central grade schools. Buses for this service are of two types—very light construction for use on dirt and unimproved roads and the heavier type designed for use on improved and hard roads.

**Motor Stages**—Seating from 12 to 20 passengers, operated by one man, pneumatic tires, speed of 20 to 35 m.p.h., are coming into prominence.

This type of vehicle is suitable for suburban service and passenger traffic between cities. Motor stages of this type—the European "Charabanc"—are now very largely used in California and many of the western railroads are using them as feeders to and from their divisional points.

**Single Deck Buses**—Seating from 18 to 30 passengers—operated by one man—pneumatic tires or cushion wheels—speed governed by ordinance.

This type of bus can be used to supplement the service of double deck buses during the peak hours in cities where the volume of traffic does not require the use of a heavier type bus; also used as extensions to double deck bus service carrying passengers further out into the suburbs; can be used by public utility companies to supplement present trolley systems and as cross town feeders. At present it is almost impossible to raise money for public utility extensions and improvements, and this type of bus presents an inexpensive method of extending present facilities without the need of expensive track and power house construction. This type of bus can also be used for transfer of passengers between railroad terminals and hotels.

**Double Deck Buses**—Seating from 40 to 50 passengers, manned by driver and conductor—operating on solid tires or cushion wheels.

This type of motor bus is indicated for service along regular routes preferably on streets not occupied by trolley tracks, covering distances from 4 to 10 miles, along the main arteries of traffic. They can be profitably operated in large cities and in smaller cities where there is a heavy peak load at certain hours of the day.

There are, in addition to the types mentioned, one or two other phases of motor bus construction which may be described as incident to a period of transition. In this class should be placed the trolley bus, operating without tracks on rubber tires, obtaining its power from an overhead trolley. Also, the flanged wheel motor bus, operating economically and efficiently as a passenger vehicle on short line railroads where the traffic does not warrant the use of expensive railroad equipment.

### Design Problems

Motor bus operation in many cities has shown that standard truck chassis are not suitable for motor bus construction and service for the following reasons: excessive weight; too much unsprung weight; high center of gravity; rigidity of suspension; unsuitable gear ratios; narrow treads; large turning radius; stiff steering gear; high top clearance; high passenger floor; too short wheel

base, causing dangerous overhang. The development of these shortcomings of standard truck construction shows the necessity of special construction for motor buses, covering the following points:

- Lightness with strength (insuring minimum gas consumption).
- Small unsprung weight.
- Low center of gravity.
- Flexible control.
- Special transmission.
- Wide treads (eliminating swaying of bus).
- Ample wheel base (to prevent undue overhang).
- Short turning radius.
- Low-step entrance and exit.
- Low top clearance.
- Curb receipt and delivery of passengers.
- Ample brake capacity (to provide for frequent stops).
- High-low gear efficiency (to provide for frequent starts).

The above points cover the desirable and undesirable features to be considered in the construction of double and single deck buses for regular city routes. As important considerations are involved in the special designing of motor stages and school buses, but time does not permit an enumeration of these factors.

Consideration should also be given to the use of bus trailers in the peak hours of traffic. They should have their own brake equipment.

Gentlemen, out of the motor truck industry will arise in the next few years, The Spirit of Transportation which will give to America automotive transportation of passengers in specially designed motor buses. The nation now needs and can use a sufficient number of motor buses of the various types enumerated, to keep our combined motor truck factories in continuous production for years to come.

## Motor Car Transport in South Africa

**I**N an interview on the Gold Coast, South Africa, as of Aug. 10, His Excellency Brigadier-General Guggisberg, C.M.G., D.S.O., says:

"Motor roads we have in plenty. In fact, we have in the whole of the Gold Coast about 3000 miles of motorable roads open for traffic. That is to say, 700 miles are open all the year round, but the remainder are necessarily closed for a couple of months during the height of the rains. The motor roads, although they have served very well in the past, form an up-to-date system of transport for nothing but short distances. The cost of construction and maintenance is very high, the cost of running lorries on them is also high.

"As an example, the following are the comparative costs of conveying one ton of produce one mile on the Gold Coast:

"By carriers, 8s. 6d. a ton per mile.

"By Ford lorry carrying 15 cwt., 3s. a ton per mile.

"By Ford lorry carrying 15 cwt. and pulling a trailer containing 10 cwt., 2s. a ton per mile.

"By medium lorry carrying altogether about 2 tons, about 1s. 6d. a ton per mile.

"By railway, 3¼d. a ton per mile."

**R**UST prevention for files and other iron or steel parts is effected in a simple manner by dipping the parts in strong milk of lime and letting them dry as rapidly as possible. As long as the layer of lime remains intact no rust can form. If the parts are used, the lime layer is removed without difficulty by means of a sharp brush. This process, recommended by *Werkstattstechnik*, is especially important in the case of stockrooms that are not absolutely dry.

## Right-Hand Steering

Editor, AUTOMOTIVE INDUSTRIES:

It is wrong to think that right-hand steering is a serious requirement in Europe, and in particular in those countries where driving to the left is the custom, as in England, Sweden and some parts of Italy. Why, then, are all the European-made cars right-hand driven? The answer I would give is the following: Right-hand drive seems to have originated from the way horses were, and still are, driven. Anyone knows that the ordinary man can use only his right hand to properly handle the whip. Certainly then he must hold the lines with the left hand. To drive one or many horses properly the lines must be kept in the center of the carriage and thus we see how it is necessary to sit to the right when driving horses. When the automobile was first built it was natural that driving should be at the right, and thus we received the right-hand steering.

On the modern car the control (gear and hand-brake handles) is located in the center of the car, and to operate it with ease and comfort it is necessary to have the steering on the left side, and let the right hand operate the gear shift. Certainly the left steering as practised in America has something to do with driving on the right side of the road, but there was no left steering from the beginning, and it is there to-day because the center control is there and must be there to have the car up to date. I think that in a year or two most of the European-made machines will also have the center control, and no doubt they will then soon change to left steering no matter whether the car is manufactured in England, France or Germany. As an example, the French "Citroen" already has left-hand steering, and most British and Italian cars have the center control, although this year more seem to have the right-hand steering.

It is not at all comfortable to drive the average American car with the right-hand steering. Take a car of the \$2,000 class and see the difference in the standard car with the left-hand steering and the so-called export model with the right-hand steering. All the manufacturer usually does is change over the steering and the pedals to the right side. When the pedals were on the left side there was plenty of room for the feet and the accelerator pedal was to the right of the foot-brake. There was more than enough room for everything, and to reach the starter button one had only to step on it without using the left foot on the clutch pedal. The same car altered to export model, with right-hand steering, often has the steering wheel located at a slight angle to the instrument board for the reason that the exhaust pipe may have been somewhat in the way to enable the manufacturer to put the wheel straight. This does *not* matter very much, however, but the big thing is the way the pedals and the starter are located. There is *not* the same roominess as on the left side, for the hand-brake lever takes away much space. The accelerator pedal is located between the clutch and brake pedals, and it all looks and feels crowded. When driving the left leg is usually resting on the hand-brake lever, and to reach the starter button one is compelled to use many motions with the feet. In many cases the starter

cannot be reached unless the driver gets up from his seat, and in the cases where this is not necessary, the driver has to use the left foot, which naturally means that he has to have the gear in neutral. The exhaust pipe is, in most cases, located on the right side of the motor on the American car. Anyone knows how the heat is felt from the floor board on a warm summer day. In the export car, with right-hand steering, this heat is extremely uncomfortable as it has open flow through the holes for the pedals.

The right-hand driven car has often no changes in the instrument board, consequently the driver cannot easily see the instruments, which usually are located to the left as they are on the standard model. In a few cases the instruments are in the center of the board.

The public in foreign countries really prefers a left-hand driven car, especially when it is an American car. Take, for instance, the Scandinavian countries. In Sweden, where the driving is to the left, it is easier to pass or to meet a car on the road where there is left-hand steering, as the roads usually are narrow and it is important to know how near the road-ditch one may keep the car when meeting another, or how near one may drive when passing a car. In Denmark and in Norway the driving is to the right, the same as in the States, and there is no reason why right-hand steering should be asked for there. The Norwegians at least have awakened to the fact that they do not want anything but left-hand steering.

To sum up, the American manufacturers should forget right-hand steering when filling export orders. Their agents and their customers will be pleased with the left-hand steering, and those cases where the manufacturer charged his \$25 extra for the right-steer outfit, the agent will be glad to have this amount reduced on the invoice.

When the manufacturer receives orders from far-away countries, and the order stipulates right-hand drive, it will pay all concerned to have the manufacturer tell his agent that in a right-hand driven car this or that will be out of place and uncomfortable. He should not be afraid of losing the order for that frankness. In every case the agent will say that the standard way is accepted.

BIRGER JACOBSSON.

IN the course of a paper read before the Royal Society of Arts, Sir Charles Bedford said that the Denaturation Subcommittee of the Empire Motor Fuels Committee had conducted an exhaustive practical inquiry, and had come to the conclusion that redistilled bone oil was the substance which most closely complied with the desiderata for a denaturant as laid down by the Board of Customs and Excise. At the present time the Engineering Subcommittee of the same body was understood to be conducting elaborate inquiries on a large working scale in conjunction with the experts of the London General Omnibus Co., and their report was now awaited. Light caoutchoucine in combination with secondary substances, such as shale oils, benzol, gasolines and sulphurous oil residues, came next in efficacy, but it was not known yet whether it would serve for motor purposes.

# Developing the Individual for Institutional Responsibility

The Business Publishers Association has devised a course to increase individual business vision and to make business papers of constantly growing value to industry. A school of industrial journalism has been established for developing and training staffs of business publications.

**T**HE progressive development of an organization is usually in direct proportion to the individual growth of the individuals within the group. AUTOMOTIVE INDUSTRIES has frequently pointed out the desirability of increasing the scope of the employee's vision of the business as a whole. Various methods of promoting such individual development have been outlined. Other business papers have discussed the same question at considerable length.

As an indication of a firm belief in the fundamental character of such personal development, the New York Business Publishers' Association has put into operation a plan by which the members of the staffs of the various business papers will be given a comprehensive and thorough training covering the editorial, business, and service activities of industrial publishing. Like any other business, industrial publishing includes a number of separate departments and activities. In order that an individual worker in any department may function at maximum efficiency, he must have a comprehensive knowledge of the policies, ideals, and aims of the other departments of the business.

In addition to these points of similarity with other businesses, however, the business paper staff employee has to deal with problems of fundamental analysis in a peculiar sense. He must be able to weigh relative values, analyze clearly and constantly, and keep in close touch with the entire field in which he is working. The ability to do this can be acquired by experience, but experience alone does not teach rapidly. It is a recognition of this fact that has led the Business Publishers' Association to establish a school of industrial journalism.

The course is designed to meet two urgent needs:

1. The need of individual workers in this field for well organized instruction in the principles and practices of the business.
2. The need of industrial publishing organizations, both small and large, for closer team work among the members of their staffs.

Co-operation of the leading industrial publishers has made the course possible. The idea was originally proposed by H. M. Swetland, president of the United Publishers Corporation, and the plans have been worked out under his leadership by the New York Business Publishers' Association Educational Committee, of which he is chairman. Associated with him on this committee are J. Malcolm Muir, vice-president, McGraw-Hill Company; M. C. Robbins, publisher, *Gas Age*, and president of Associated Business Papers, Inc.; J. C. Oswald, publisher, *American Printer*; E. P. Harris, of Harris, Dibble & Company; and R. H. McCready, president, McCready Publishing Company, and president of the New York Association.

The "study-unit" plan will be used in conducting the

course. This plan, which combines home study and weekly class meetings, has been developed by the Business Training Corporation, which has been engaged to prepare the text and other educational material and to organize and direct the instruction staff. All the instructors will be men who are now engaged in industrial papers, so that the instruction will be intensive and practical.

Special texts on the subjects covered in the course are being prepared with the aid of a Cooperating Staff of forty well-known publishers, editors, business managers and service department managers affiliated with the New York Business Publishers' Association. These men have supplied the material and data which will be the basis of the course.

The increased influence of business publications during recent years has made such a course as this specially desirable. This increased influence has brought with it increased responsibilities. Subscribers and advertisers have learned to expect types of service which cannot be rendered without special effort and organization. This course marks a definite recognition by industrial publishers of these responsibilities and obligations.

Considerable interest in this course has been evinced by men not directly associated with business publishing, while within the ranks of the publishers the idea is being supported with enthusiasm. The course will be taken by practically all of the business and editorial executives of the papers affiliated with the association. Several men in different industries have also signified their desire to get the insight into industrial publishing offered by the course. Such men from the outside will be welcomed.

The entire course will last eight or nine months. Classes are being organized and will begin work within a few weeks. In addition to classes for members of the New York Business Publishers' Association, arrangements will probably be made for classes for business paper organizations in Chicago, Boston, Philadelphia, Cleveland, St. Louis and other cities.

The course is organized in fifteen study-units, each one of which is devoted to a distinct subdivision of the general subject. Each study-unit requires two weeks. The length of the whole course, therefore, is thirty weeks, which is equivalent to the customary university year.

A general outline of the course indicates clearly the broad scope of the material to be covered together with the practical nature of the training:

## SECTION A—INTRODUCTORY

### UNIT I—THE FIELD OF INDUSTRIAL PUBLISHING

1. Fundamental functions of an industrial paper.
2. Scope and influence of industrial papers in modern business.
3. Evolution and growth of industrial publishing—in the United States—in relation to foreign countries.
4. Distinctive features of industrial publishing—in relation to

- other lines of business—in relation to other kinds of publishing.
5. The ethics of industrial publishing.
  6. Opportunities for intelligent productive service and for personal advancement.

**UNIT II—ORGANIZATION AND PERSONAL REQUIREMENTS**

1. Main activities in industrial publishing—editorial—business—service.
2. Organization of an industrial publishing business—departmental relationships and teamwork.
3. Recruiting the organization—sources—methods.
4. Personal traits required on an industrial paper—methods of developing these traits.
5. Self-analysis tests.

**SECTION B—EDITORIAL ACTIVITIES****UNIT III—EDITORIAL CONTENTS**

1. Determining the general editorial policy.
2. Types of articles desired—sources for securing them.
3. Handling regular departments and current trade news.
4. Getting the right point of view of the industry—keeping in touch with the industry.
5. Cultivating editorial judgment—testing news value.
6. Keeping ahead with editorial policies and opinions.

**UNIT IV—EDITORIAL METHODS**

1. Gathering material and data—from industrial leaders—through field correspondents—miscellaneous sources.
2. Classifying and filing material and data—inclusive index files—compiling illustrative and statistical data.
3. Planning and scheduling editorial work.
4. Budgeting editorial expenses.
5. Managing an editorial staff.

**UNIT V—PREPARING EDITORIAL MATERIAL**

1. Preliminary steps—picking live questions—outlining articles—classifying sources.
2. Field investigating—gathering information—making notes—securing illustrations—checking up.
3. Writing the article—style—giving current interest.
4. The art of interviewing.
5. Reporting conventions and other meetings—verbatim reports—journalistic reports.
6. Testing articles and other reports.

**UNIT VI—WRITING FOR INDUSTRIAL PAPERS**

1. Essentials of good style.
2. Securing unity—through outlining—through avoiding extraneous matter.
3. Securing coherence—by proper arrangement of ideas—by accurate connectives.
4. Securing force—by concreteness—by repetition—by emphasis.
5. Making news value count.
6. Use of illustrations, charts, tables and summaries.

**UNIT VII—PRODUCTION TECHNIQUE**

1. Preparing manuscript for printer.
2. Typography—various type faces and their uses—colors.
3. Physical appearance of publication—paper—illustrations—layout.
4. How editorial and advertising departments can lessen work in print shop.
5. Proofreading and final changes.
6. Procedure in print shop and bindery—typesetting—electrotyping—printing—binding.

**SECTION C—BUSINESS ACTIVITIES****UNIT VIII—CIRCULATION-BUILDING**

1. Code of ethics governing business activities in industrial publishing—what constitutes good business practice.
2. Selective basis of circulation.
3. Lists of prospective subscribers—sources—analysis—checking.
4. Circularizing and follow-up plans and methods.
5. Personal solicitation for subscriptions—part time agents—full time salesmen.
6. Space advertising for subscriptions.
7. Special book and other offers—uses and dangers.

**UNIT IX—CREATING ADVERTISING**

1. Selective basis of advertising in industrial papers.
2. Six essential conditions for profitable advertising—analyzing and testing for them.

3. Advantages of industrial papers as advertising mediums.
4. Rates for advertising space—based on quality, circulation and publication's influence.
5. Classes of advertising prospects.
6. Sales promotion methods to secure advertising.
7. Principles of salesmanship in securing advertising.

**UNIT X—HANDLING CORRESPONDENCE**

1. Importance of correspondence in building good-will.
2. Fundamentals of good business letter writing—adaptation to reader—correct analysis—careful planning.
3. Beginnings and endings of letters.
4. The five C's of a good business letter and how to attain them—clearness—correctness—conciseness—courtesy—character.
5. Sentence structure and paragraphing.
6. Getting action through letters.
7. Special types of letters—editorial—circularizing—selling—collecting—adjustment.

**UNIT XI—ACCOUNTS AND COLLECTIONS**

1. The necessity of especially accurate records in industrial publishing because of long-term contracts—allocating expenses and incurred obligations.
2. Chief items of income and expenditure—classification and percentages.
3. Characteristics of good records—accurate—timely—simple—adequate.
4. Using accounts in management—comparative statements to show tendencies—unit costs.
5. Use of statistics—charts and graphs.
6. Budgeting and checking up actual against estimated results.

**UNIT XII—DEPARTMENTAL MANAGEMENT**

1. Fixing definite quotas and objectives.
2. Establishing standards of performance or output.
3. Making conditions right for effective work.
4. Systematizing routine operations.
5. Scheduling and dispatching.
6. Layout of an office—of a desk.
7. Mechanical aids to efficiency—records—charts.
8. Handling employees—getting teamwork.

**SECTION D—SERVICE ACTIVITIES****UNIT XIII—SERVICE TO THE INDUSTRY**

1. Special research and studies for the benefit of the industry as a whole.
2. Creating industrial literature in the fields served.
3. Handling and answering general inquiries in the industry.
4. Compiling statistics and general data.
5. Issuing reviews and forecasts.
6. Studying foreign conditions and markets and promoting foreign trade within the industry.
7. Preparing handbooks, annuals and directories.
8. Working with trade associations and technical societies.
9. Influencing public opinion and governmental bodies.

**UNIT XIV—SERVICE TO ADVERTISERS**

1. Service on mechanics of advertisement—display—type—illustrations.
2. Service on message of advertisement—the right note—preparation of copy—headlines and sub-heads.
3. Furnishing special information on the industry—data on viewpoint of industry—business and marketing conditions—technical development in industry.
4. Studying and analyzing merchandising problems.
5. Helping to check plans and results.
6. Relation of advertising service department to advertising agency.

**SECTION E—ETHICS AND POLICIES****UNIT XV—ETHICS AND POLICIES IN INDUSTRIAL PUBLISHING**

1. Standards of editorial practice.
2. Standards of business practice in relation to circulation building and advertising.
3. Standards of practice with relation to competitors.
4. Ethical principles covering relations with industry and with advertisers.
5. Determination and formulation of basic policies of an industrial paper.
6. Present tendencies in industrial publishing—greater specialization—combinations.
7. Preparing for the needs and problems ahead.

# The Basis of Industrial Understanding

It is easy to desire to deal fairly with employees, but hard to work out the theory. Because of past occurrences, many workers regard employers with suspicion. This makes difficult a practical application of the square deal idea. Considerable study necessary to obtain results.

By Harry Tipper

**A** GOOD many of the letters received from the subscribers to AUTOMOTIVE INDUSTRIES from time to time reiterate the statement that it is not so much the method of operation as the square deal with the employees which counts in building an organization.

There is no doubt about the truth of this statement in the abstract. As a practical matter, however, the difficulty of getting to an agreement is not removed by any sentimental desire for a square deal or by the consideration of platitudes and truisms relating to it. A very few conversations with employees on one hand and workers on the other hand reveal suspicion and a general belief on each side that the other side is not dealing in actions and holding opinions which are fair.

Many times employers have stated to me their desire to be fair with their workmen and in the same breath have stated the impossibility of dealing squarely with them on account of the unfair opinions they hold and the unfair actions they take. On the other hand, workers have frequently pointed out the injustices from which they suffer or think they suffer and the impossibility of believing the employer who permits such injustices to go on.

This division is sharp and pretty general. The suspicion is of long standing. No habit of mind which is of long standing can be changed rapidly and with ease. Prejudices that are deep-seated cling very tenaciously and are not removed by an abstract desire for agreement or a vague belief that peace is better than warfare.

A very large part of the general cry for understanding is a demand that the other man understand us and make all the allowances that should be made for our prejudices, our weaknesses, and our values.

Justice is based upon understanding, but the understanding must be broader than ourselves and particularly it must take in a thorough understanding of the other parties. Square dealing is not governed by a desire to be fair, but by the understanding which makes it possible to be fair. And that understanding is rarely secured, although the desire for square dealing is fairly general. Therefore, it is necessary not merely to discuss the principles which enter into productive co-operation, but it is important to consider the methods by which the co-operation has been secured in the individual cases, because the practical result can only be obtained by the patient working out of the improvement.

Just as the experimental department is the scientific laboratory for mechanical improvement and industry, so the factory is the industrial laboratory out of which grows the human development. The men who are engaged in the experimental work are prepared to follow carefully and relentlessly every clue to improvement which may be sug-

gested to analyze, test, and operate all these possibilities until the conditions are thoroughly understood and the improvement can be turned into practical reality.

Something of the same kind is required in the development of human relations within the establishment. The same painstaking study, experimenting with, the testing and rejecting of many methods before sound practice is discovered, must govern the development of the productivity in relation to the human affairs of industry itself.

Comparatively few executives are willing to undertake a somewhat difficult study of the human side. They are buried in the technical requirements of their own work, in the mechanics of organization or in the economics of the propositions before them. The reports which come to their desk do not contain any expressions of human value or quality. They do not deal with incentives, fatigue, or aspirations, and they do not suggest a waste which is going on from a human standpoint. The ordinary duties devolving upon the executive are not such as to emphasize the human side or lead the imagination into the consideration of the human causes behind the economic effects.

This is sufficiently the case to give rise to the mistake of considering economic effect as causes, and we talk of these economic conditions as though they were the reasons for the development of business tendencies and situations, instead of the effects produced by our methods of human organization and our difficulties of human understanding.

Very few men in industry would answer in the negative if they were asked, Do you believe in dealing squarely with your employees? On the other hand, very few men devote a considerable part of their time to the discovery of the human causes behind the inefficiencies exhibited in the mechanical results and to the patient consideration of the methods by which they can be overcome.

Two years ago, when the amount of labor was less than the demand for it and the efficiency of labor was lower than usual, a good many executives in industry were spending a lot of their time in an endeavor to meet the labor difficulty without any previous knowledge of the causes and without much hope of arriving at a more than temporary solution.

Just now while labor is plentiful and there is a large amount of unemployment, and as a consequence the efficiency of labor is a little higher, very few of those men are continuing their study and endeavoring to provide themselves with the information which will enable them to meet future difficulties better than the past difficulties were handled.

Even in the best of organizations employees are prone to suspect the motives and justice of the employers. There is a tendency for every man to overemphasize the value of the services he renders and the influence exerted by those

services upon the total result. This runs through all ranks of workers. It is interestingly displayed in the speeches of engineers, doctors, advertisers, salesmen, and others, who in acclaiming publicly the importance of their own occupation, show the extent of its influence upon civilization, so that the unprejudiced reader would be able to determine whether religion had been of as much importance as salesmanship, or engineering had done as much work as advertising.

Because of this tendency and because of the limited range of interests and understanding, there is always large ground for suspicion. We are always apt to suspect those things of which we know little, and the decisions rendered, because of evidence we have not reviewed, are apt to meet with our criticism.

It is in the solution of these small problems of personal grievances in the development of confidence between individuals that the executive becomes trained in the causes of human inefficiency and becomes capable of approaching the larger problems with some hope of solving them or preventing the larger problems from becoming active by the solution of the smaller ones.

It is particularly unfortunate that executives in industry do not study the human side of the matter until they are confronted with a strike or a general difficulty or some unusual inefficiency. They are obliged to approach the large problem without any previous experience with the small problem and with no established confidence arising out of the personal adjustment.

It is impossible under such conditions to arrive at a solution of the larger problem and it is unlikely that we shall do anything important in the advancing of human relations in industry until the same time and patience are put upon the daily individual difficulties that are put upon the routine and the economics of the large problems of strikes and general disturbances.

We are much better advised in economic affairs and our methods of education are much more effective in that regard. We do not attempt to put the young engineering student in front of the complicated problem of managing a huge industry. We train him in the solution of the simple and more primary problems, so that in each stage of his development he is encouraged to tackle a somewhat larger problem, until he is capable of handling the most important.

In most of the cases of successful industrial establishments, securing an unusual efficiency per individual and unusual freedom from industrial disturbances, the work has been done principally by the ability of the executives in adjusting the personal differences, their understanding of personalities, and their gradual gain in experience, so that the larger matters have been solved more or less readily upon the background of the previous work.

There is a general impression that intangible subjects like this one may be dealt with by any observing individual without the patient development of the skill and understanding required in the mastering of mechanical pursuits. This impression is widespread and is perhaps the greatest difficulty in the way of development from the human side of organization. On the other hand, the economic results secured by executives who have devoted time and patience to the study have been sufficiently important to justify the work which they have devoted to the matter.

The present period of depression is usually considered as a period which will be followed by a gradual extension of the business with more difficulties in securing a profit. All such previous periods have demanded a greater efficiency in the production in order to surmount the difficul-

ties imposed by the new conditions, and the progress in the mechanical arts has come largely from these necessities.

The manufacturing capacity of the United States at the present is almost three times per capita the capacity of either Great Britain or Germany, and as a consequence the problem of disposing of enough product to fill our factories is a very serious one. Part of this problem must be met by the increased efficiency of production, and in a large measure this increased efficiency will come out of the increased productivity of the individual.

A good many changes can be made in the mechanical systems but the improvements that can be secured in this respect will not be sufficient at any particular time to affect the total result except in minute percentages.

The capacity of the individual has not been increased even though it fluctuates under different economic conditions and there is a large unused capacity which would permit improvements in productivity in very great amounts if this unusual individual capacity could be harnessed. It can be harnessed only as the confidence, the incentive, the interest in the work and the character of the reward agree with the organization requirements and keep the enthusiasm of the worker centered upon his organization and his work.

This desirable condition is not to be arrived at by merely talking about the square deal or an academic desire for the square deal. It will be secured by a careful study of the individual problems, adjustment of personal grievances, and extension of education and understanding within the plant.

In this, as in a number of other human problems related to industry, that way which appears to be the longest way round is the shortest way to the permanent conclusion. Temporarily it is easier to control an organization by instructions and orders than it is by education and understanding, but the centralized systems of instructions and orders do not develop the individual and they provide no incentive for development. They fail finally because of this fact, while the slow apparently inefficient and unsystematic method of creating confidence between the individuals, adjusting the personal differences, educating the minor executives on the purposes of the organization and developing the possibilities of the workers in their own work, result in a final efficiency far greater than the efficiency produced out of the centralized systems, subdivided work, the rule, and the control of instruction.

SEVERAL rings have recently been tested by the ball method at the Bureau of Standards in Washington. The method used is a modification of that heretofore employed which uses two balls the sum of whose diameter is slightly greater than the diameter of the ring. The new method consists of placing three balls of the same diameter in a ring 120 deg. apart with a fourth ball resting on them. This method gives substantially the same results as the two-ball method. In this connection there is need for a more accurate method of governing the contact pressure in measuring precision balls. The machine with a drop plug indicator on which this work is now done has sufficient friction in the anvil end to cause an uncertainty in the measurement of the contact pressure used. To provide a better means for measuring balls, and also for comparison of precision gage blocks by mechanical means, drawings of the Millionth Comparator used at the National Physical Laboratory, England, and by the Pratt & Whitney Co. have been secured and it is to be expected that a similar comparator will be constructed at the bureau.

## The German Show

THE German automobile show, which opened in Berlin on Sept. 22, is of special interest this year because it shows the engineering and commercial status of the German industry for the first time since the war. The designs presented at this show represent the accumulated experience of German engineers during the last seven years.

While only brief reports are available at this time, the special cable report, printed on the news pages of this issue, indicates several interesting trends. Chief among these is the fact that the show was apparently far more than an automobile show—it was, in a sense, an automotive show. Not only were automobiles and accessories exhibited, but also trucks, bodies, motorcycles and even machine tools. Thus it would appear that this post-war Berlin show was designed to interest every group from the car user to the manufacturer. It will be particularly interesting to learn the reasons for giving the show so broad a scope.

The Germans are apparently about to make a strong bid for foreign automotive trade. The low value of

the mark, of course, will aid them materially, while the efforts they have made to achieve simplicity of design and minimum production costs will be a helpful factor. An additional indication that the show is an effort in this direction is the fact that all foreign cars were barred, even Austrian cars having been prohibited from exhibiting.

## Gear Changing

IT is well known to every automobile driver that with a sliding pinion change gear it is ordinarily much more difficult to change from a higher to a lower gear than vice versa. It is not much of a trick to change from first to second without grating of the gear teeth, and changing from second to high, in case of a three-speed gear, involves no difficulties at all, as no gears have to be meshed and the clutch jaws slide readily into engagement.

When the clutch is disengaged and the gears are unmeshed, both the clutch-driven member and the car slow down in speed, owing to the resistances encountered in their motion. If the change of gear is made very fast, there will be no appreciable change in car speed between the unmeshing of the low and the meshing of the intermediate gears. As the intermediate gear is engaged the clutch speed must be reduced. There is a natural tendency for the clutch to slow down in speed owing to its bearing friction, and this probably explains the comparative ease with which the change from low to intermediate gear can be effected as a general rule.

The change from high to intermediate and from the latter to low is not so difficult on a steep hill, as in that case the speed of the car decreases very rapidly when the gears are unmeshed and assumes a value corresponding to the lower gear to be engaged. In fact, it is usually necessary to shift the gears quite smartly, otherwise the car will lose too much speed and will be hard to keep under way. But occasionally it is desired to go into intermediate or low gear for the sake of accurate control, in places where the road is comparatively level. The car then loses speed only slowly and it is almost impossible to make a quick change of gear without unpleasant gear noises. Either the driver has to wait until the car has slowed down a great deal or else he must speed up his engine and partly engage the clutch while the gears are out of mesh, so as to bring the speed of the clutch into correspondence with that of the car on the gear to be engaged. This latter operation is a rather delicate one and is fully mastered only by few drivers.

Generally speaking, gear shifting is the easier the less the difference in the ratio between successive gears. With a four-speed gear the ratios between successive gear speeds are smaller, as a rule, than with a three-speed gear, and a four-speed gear should, therefore, be easier to handle than a three-speed. Of course, the inertia of the clutch is an important factor in every case. When the gears are meshed, the speeds of the clutch and of the car are brought into a definite relation, which generally means that one has to speed up and the other slow down. As the inertia of the clutch is ever so much less than

that of the car, by far the greatest change takes place in the speed of the clutch, and the force of the impact when the gears are brought together depends almost entirely on the polar moment of inertia of the clutch-driven part.

## The Gasoline Tax

NO statement is quite so misleading as a half-truth. Advocates of the gasoline tax in various states have pointed out that such a tax is fair because it is a somewhat accurate gage of the degree to which a vehicle uses the roads. There is a certain degree of truth in this assertion, but the other factors bearing on the situation are such as to entirely destroy its validity for argumentative and legislative purposes.

To begin with, all gasoline is subjected to the tax. Thus, many gallons are taxed which never find their way into motor vehicles used over the roads. The chief fallacy of the argument, however, lies in the fact that many other motor vehicle taxes operate simultaneously with the fuel tax, thus obviating the function of the fuel tax as a proportioning medium.

Ten new states have added a gasoline tax within the last year, yet in no case has there been any diminution of other motor vehicle taxes. The fuel tax has simply been placed on top of other taxes in every instance. It is not a substitute tax, but an added tax burden.

Thus, even a slight analysis shows the unsound basis of the half-truth brought forward in favor of gasoline taxes. Yet a recent N. A. C. C. survey brings to light the surprising fact that motorists in many states were found supporting the fuel tax on the basis of this fallacious reasoning. If the gasoline tax were made the only tax imposed upon motor vehicles in any one State, and if such a tax were apportioned in accordance with the usage which such a vehicle obtains from the highways, there would be a valid argument in its favor. As the matter stands, however, this very definitely is not the case. The gasoline tax simply imposes upon owners an increased tax burden, increases sales resistance for those selling motor vehicles and fails to meet the requirements of a sound taxation policy.

## International Trade

THE suggestion has been made that American manufacturers would enhance their prestige in many countries by substituting the word "international" for the term "export" or "foreign" as used in their correspondence, literature and advertising. Export or foreign, as terms, have no meaning when they are read in another country. The American manufacturer, of course, can consider his business in China, we might say, as being foreign, but it is not foreign to the dealer or buyer there. The same may be said of "overseas" or similar other designation.

Translations of English into other languages almost without exception turn such words into the equivalent of "foreign" or "foreigner," and the buyer or dealer in another country thus sees himself con-

sidered as a "foreigner." This term usually carries with it something of unpleasantness, as is evidenced in our own use of it in regard to the hordes of immigrants who have come to this country from Europe. The term is no more pleasing in other countries and its use may set up a conscious or subconscious barrier that does not promote friendly relations, although it may have been used entirely in a business sense.

The word international is more pleasing; it conveys an idea of size and spread that is readily appealing and certain companies have incorporated this into the name of their export company.

## Increased Salaries for U. S. Foreign Consuls

A NUMBER of United States consular officers in England have resigned within the past year because of a lack of sufficient pay to allow them to maintain the living standard set by representatives of other nations. For many years various interests have endeavored to have this situation remedied by increasing the salaries of the men who represent this country's business interests abroad. Despite these efforts nothing has been done.

Our foreign consuls play an important part in America's export trade and they surely deserve a monetary consideration consistent with the efforts they expend. In the past they have frequently benefited the manufacturer of automobiles in supplying him with information that otherwise would have been unattainable without considerable expenditure of time and money. But all these facts are too well known to deserve discussion here. The fact that these men, who remain at their posts, are forced to deprive themselves of many of the things that have always been considered necessities should be enough to enlist the whole-hearted support of manufacturers in the effort to secure increased salaries for them.

Statistics have been presented showing that the salaries of American representatives abroad are from 30 to 40 per cent less than those paid to men holding similar positions from other countries. The average salary of American consuls general is but \$6,620 a year. Consuls of Great Britain (not consuls general) receive an average total payment of from \$6,983 to \$7,056, while Americans holding these positions receive an average salary of \$3,720. And British business men are complaining that the salaries of their representatives are too low.

Honor is, of course, attached to a consular position, but the functions of the consul require men of real business ability. Only such men are capable of rendering valuable service to the industry. But because they are capable of rendering this service their ability if expended along other lines would be recognized to a greater extent so far as salaries are concerned. Again, the type of men who accept a position for the honor alone are not generally those capable of performing the duties the consular service is expected to perform.

# Production Decline Not Imminent

## September Business Is Exceeding August

### Collections Generally Good With Progress Made in Reducing Past Due Accounts

NEW YORK, Sept. 27—Reports of current business made by members of the Motor and Accessory Manufacturers Association to the credit department show that their business for September is running slightly ahead of August. A considerable amount of new business has been booked which indicates that no falling off in the production of passenger cars is imminent. Collections generally are good, and they show an improvement from month to month. Progress also is being made in cutting down past-due accounts. Indications are that business for the next two or three months will continue about as it has been running since May.

Fully as significant as the actual business booked is the feeling in all branches of the industry that the worst is over and that the tide has turned definitely toward better conditions. Improved morale is apparent throughout the industrial world and is reflected in nearly all lines. Leaders among financiers and manufacturers are convinced that the business depression has been due largely to a state of mind and that once optimism dispels pessimism throughout the country the consumption of finished products will increase, unemployment will become less general and buying power will expand.

### August Business Better

So far as the parts makers are concerned, their chief complaint is against automobile companies which have failed to release partly fabricated materials ordered 15 months ago. There are a considerable number of companies in this group and it is felt that if they ever are going to get out of their difficulties they should have made some progress by this time. This does not apply so much to the truck field because it is realized that truck sales have been virtually at a standstill for many months.

There is little complaint against the companies which actually are doing business and have been to some extent ever since the depression began. There have been of late comparatively few cancellations and automobile manufacturers have shown a disposition to clean up their commitments when price concessions have been made.

The report of August business made

## M. A. M. A. MEMBERS' BUSINESS FOR 8 MONTHS

NEW YORK, Sept. 27—The following table shows at a glance the business done each month this year by the members of the Motor and Accessory Manufacturers Association together with the total of past due accounts held by members, the total notes outstanding and the percentage of change each month:

Month	Total Purchases	Per Cent Change	Total Past Due	Per Cent Change	Total Notes Outstanding	Per Cent Change
January	\$6,264,587	.....	\$8,099,727	.....	\$4,359,871	.....
February	10,408,962	66.15 Inc.	6,717,165	17.07 Dec.	6,063,118	39.08 Inc.
March	20,120,386	93.30 Inc.	5,603,992	16.57 Dec.	5,069,877	16.38 Dec.

May	26,781,350	.13 Inc.	4,505,176	15.64 Dec.	4,460,355	16.77 Dec.
June	22,703,414	15.19 Dec.	4,720,973	4.79 Inc.	4,012,670	10.37 Dec.
July	23,096,214	1.68 Inc.	5,242,046	10.79 Inc.	3,690,154	7.90 Dec.
August	23,397,640	1.31 Inc.	4,348,790	17.06 Dec.	3,494,510	5.30 Dec.

by members of the M. A. M. A. shows that there was a slight increase in the total of goods sold as compared with July and very little reduction in the total of past due accounts.

## Walsh Gasoline Tax Proposal Unpopular

WASHINGTON, Sept. 27—The proposal of Senator Walsh of Massachusetts to incorporate in the tax bill a tax of one cent per gallon on gasoline will probably fail to receive serious consideration from the Senate. Though the author is a minority member of the Senate Finance Committee, his substitute will not receive the approval of the Republican majority at this time because they are determined to push the plan of tax revision as adopted by the Finance Committee.

Based on estimates of gasoline consumption for the calendar year of 1920, the one-cent tax per gallon would yield approximately \$50,000,000 annually. This tax was originally suggested by Secretary of the Treasury Mellon, in his recommendations for tax revision. The nation-wide protest from automobile owners, as well as manufacturers, had its effect and the proposal was subsequently withdrawn by the Treasury in its revision on proposed tax assessments.

There will be a long debate on the various provisions of the House bill as amended by the Senate Finance Committee.

## JOYCE NAMED TRUSTEE

EAU CLAIRE, Sept. 26—J. T. Joyce of Eau Claire, Wis., has been appointed trustee of the bankrupt estate of the United States Auto Gear Shift Co., of the same city, which recently filed a voluntary petition, scheduling liabilities at \$278,424 and assets at \$749,258. Creditors will meet Oct. 1.

## Athol Denies Making Use of Unfair Methods

WASHINGTON, Sept. 26—Denial has been made by the Athol Manufacturing Co. that it is or has been using unfair methods in the production and sale of artificial leather as alleged in the complaint filed by the Federal Trade Commission. The company asked the commission for a further and fuller investigation which, it says, will establish the true status of artificial leather as a useful and advantageous product. This case is of particular interest to the automotive trade because Athol top material and Athol leather are used on certain cars and tops.

The company advised the commission that the artificial leather made by it and its competitors is coming into wider and wider use and is supplanting the use of genuine leather in many lines and for many purposes. It declares that there is now real competition between its business and the business of dealers in ordinary old fashioned genuine skin and hide leather.

## FORD STARTS BODY SHOP

MILWAUKEE, Sept. 26—The Ford interests are starting work on a large body shop at Iron Mountain, as the second principal unit of an enormous woodworking operation established in the heart of the Upper Michigan forest and mining district, according to advices received here. The bulk of the wood products required by the Ford passenger car, truck and tractor industries is to be furnished by the Iron Mountain plants, which are situated in the midst of one of the richest hardwood and softwood timber belts in the world and adjacent to the famous hardwood belt of extreme northern Wisconsin. Carloads of lumber, timber, bolts and other wood products are being shipped almost daily.

# Display in Berlin Is Impressive

## German Makers Hold First Post-War Show

### Exhibit Discloses Industry on Full Production Basis—Use of Aluminum General

BERLIN, Sept. 26 (*By cable to AUTOMOTIVE INDUSTRIES*)—Germany's first post-war automobile show opened yesterday in the specially constructed Kaiserdamm Palace, which is 820 x 230 feet, in the northern suburbs of Berlin. It also marked the official opening of Berlin's 12-mile speedway which belongs to the Manufacturers Automobile Club. The show is entirely German and even Austrians are barred.

The exposition contains exhibits by 58 passenger car manufacturers, 34 truck makers, 35 body builders, 40 accessory concerns and 30 machine tool companies. It discloses clearly that the German automotive industry is again established on a full production basis. Because of the low value of the mark it is prepared to make a serious bid for foreign markets. The attendance is large and foreign buyers are plentiful.

With rare exceptions the cars are all up-to-date in design and represent the cumulative experience of the last seven years' attempts to bring production costs down to a minimum. Few German makers are following the American simplified design as German manufacturers generally prefer a higher grade, rather more costly type.

From an engineering point of view the feature of the show is the more general use which is being made of aluminum.

Eighty per cent of the cars displayed have four cylinder engines, 16 per cent six cylinder, 1 per cent eight cylinder and none of 12. Detachable heads are found in 11 per cent of the engines.

Mercedes is using steel cylinders in all models. There is a pronounced tendency toward aluminum steel lined cylinders, overhead valves, electric lighting and starting in most of the models. Ninety per cent of the cars are Bosch equipped.

The unit power plant construction is seen in 21 per cent of the engines; separate transmission in 78 per cent; four speed transmission in 83 per cent; spiral bevel drives in 39 per cent and straight bevels in 59 per cent.

Straight side tires are unknown on passenger cars but giant straights have made their appearance on many trucks. It is declared here that the Continental Caoutchouc and Gutta Percha Co. has come under control of the B. F. Goodrich Co.

There also are reports that the Packard Motor Car Co. has purchased a factory in Poland and that Ford has obtained control of the Hansa-Lloyd Automobile Co. in Bremen.

Maybach, the former co-worker of Daimler and noted as an airship manufacturer, has produced a car without clutch and gear box and with an electric motor sufficiently powerful to drive the car at low speeds, but with an emergency gear. The engine is a six cylinder, closely resembling the Dutch Spyker engine which is manufactured by Maybach. The rear axle is of aluminum and the car has front wheel brakes.

Rumpler, the aircraft manufacturer, has produced a passenger car with scientific stream lining. The chassis is in the form of a forged steel hull. It is powered with a six cylinder all aluminum W type engine. It is designed for rear driving with the rear wheels without universals. All the mechanism, including cantilever springs, is inside the hull.

Stinnes is showing a low priced cheap production car with a four cylinder all aluminum overhead valve engine.

W. F. BRADLEY.

### Goodrich Denies Report

AKRON, Sept. 27—W. C. Arthur, manager of the International B. F. Goodrich Corp., which controls the foreign holdings of the Goodrich company, denies that it has acquired or contemplates acquisition of the Continental company as reported in Paris.

### No Packard Plant for Poland

DETROIT, Sept. 27—The Packard Motor Car Co. denies that it has purchased an assembling plant in Poland. Such a proposal was made to the company several months ago but it never was considered seriously.

## British Ensign Motors in Hands of Creditors

LONDON, Sept. 16 (*By Mail*)—A chassis at the 1919 Olympia show which attracted great attention largely because of its massiveness combined with the high finish of its parts was the Ensign "six." Its introduction was typical of the senseless boom characteristic of that show. The sequel was told this week at a conference of creditors for a private arrangement of its affairs. Total liabilities disclosed amounted to \$1,220,590. It was agreed that creditors for over \$100 should secure \$2.50 per \$5 of debt in four installments. The alternative was a forced realization of assets which it was stated would yield but 75 cents per \$5 debt. This company built a fine factory on apparently little that was tangible as regards prospects.

## Revere Stock Sale Results in Arrest

### Buffalo Broker Who Bought Shares Before Receivership Charged with Extortion

INDIANAPOLIS, Sept. 26—J. R. Porter, a Buffalo broker, was arrested at Logansport last Friday at the request of the police of Erie, Pa., on charges of extortion. Several weeks ago Porter filed charges of grand larceny against Newton Van Zandt, former president of the Revere Motor Car Corp. Porter said he would waive extradition and return to Erie when officers from that city arrived. He will say nothing concerning the charges against him.

Prior to his arrest, Porter appeared before the Cass County Grand Jury which is investigating the affairs of the Revere corporation, which is now in the hands of a receiver. He appeared as a stockholder of the company.

Van Zandt contends that he never met Porter but that the Buffalo man bought 330 shares of Revere stock from another broker for \$8 a share. Van Zandt says that after he retired from the company several months ago, Porter wrote him a letter saying that he had resold the stock to a client who could not afford to lose the money which resulted from the decline in the value of the stock following the financial difficulties of the company. Van Zandt declares Porter wanted him to make good the difference but that he declined to do so because it might establish a precedent for many cases of the kind for which Van Zandt was not responsible.

A release from liability given Van Zandt by the Revere corporation came to light last week. Van Zandt is now in New York and his friends assert that he was not in any way responsible for the difficulties of the Revere corporation.

### BLAME PUT ON SPEEDING

WASHINGTON, Sept. 27—Analysis of statistics compiled by the Maryland State Roads Commission dispels a popular belief that most automobile accidents occur on the sharp curves, grade crossings and steep grades. It has been found that the vast majority are caused by the recklessness of motorists, and 90 per cent are due to speeding. Maryland authorities discovered that the largest number have occurred at the places that have always been considered safe, while the sections of roads which have been commonly regarded as extremely dangerous are proving to be relatively free from accidents.

## Truck Possibilities Extensive in Canada

**Potential Users Number 102,740;  
Ontario Obvious Field Await-  
ing Development**

WASHINGTON, Sept. 27—According to latest available statistics the motor truck field in Canada is capable of a more intensive development by American manufacturers, according to a report received from Consul Felix S. S. Johnson, Kingston, Canada, as in 1920 there were in use in the Dominion 26,852 trucks. This indicates that motor transportation occupies a guaranteed place among the Dominion's carrying systems, and that the sale of trucks has barely commenced. The real market remains to be developed, and therefore it presents attractive possibilities for enterprising American manufacturers.

### Quebec Good Prospect

A study of the commercial situation shows that while there are only 26,852 motor trucks in operation at present, there are approximately 102,740 industrial or commercial firms which must sooner or later come into the truck-using category, and this list does not include the farming element, which is gradually coming to appreciate the value of the truck as a carrier of farm products to the markets. The same figures indicate that Ontario is the obvious field which awaits development, as out of the total of the 102,740 concerns mentioned, 38,036 are located in this province. Next comes Quebec, with 29,573; Nova Scotia with 7138; Saskatchewan with 6013; British Columbia with 5761; Manitoba with 5414; Alberta with 5096; New Brunswick with 4601 and Prince Edward Island with 1108.

### Draft Horses Scarce

As an encouragement to motor truck manufacturers, there is the fact that heavy draft horses, of the kind most suitable for use on trucks, are becoming more and more scarce. Some industrial concerns state that they would be quite willing to use horses on their trucks, if the right grades could be had, but in the absence of enough heavy draft horses to meet their needs, they are falling back more and more upon motor trucks. The distribution of truck registrations for the province of Ontario shows that the big firms are leading in this line, as firms are credited with owning 26.91 per cent, while business gets 23.67 per cent of those operated. Tradesmen come next with 18.17 per cent, the unclassified have the same percentage, while farmers follow with 7.22 per cent and the manufacturer drops to the end with 4 per cent.

## Produce Two Cars Daily at Plant of Pan Motors

ST. CLOUD, MINN., Sept. 26—President C. D. Schwab of the Pan Motor Co. reported to a meeting of stockholders

that while the drop forge plant had been closed entirely for a year and the motor plant during the winter, operations have been resumed on a greatly reduced basis in the automobile factory and that an average of two cars daily now is being produced. He said that 200 cars have been turned out since the factory resumed operations and that with the material now on hand 69 more will be made before Oct. 1.

The outstanding indebtedness of the company was reduced by \$373,853 during the year. The remaining indebtedness is offset by the raw steel products on hand at the drop forge plant and more than 100 unsold cars. The stockholders consider favorably a proposal to issue \$1,000,000 in preferred stock with local banks as trustees.

## Interlocking Cord Receiver Discharged

AKRON, Sept. 27—Elihu Harpham has been discharged as receiver of the Interlocking Cord Tire Co. of this city and Mogadore following an agreement reached by the new management of the company with creditors, whereby all creditors' claims are to be satisfied. The basis of settlement will include a 15 per cent cash payment of all claims within 45 days, the balance to be secured by one and two year notes.

According to Edward Kohl, president of the new board of directors, the company has \$22,000 in cash with which to make initial payments on creditors' claims, and has \$13,600 in promissory notes and \$7,200 in other notes. Of the cash, \$12,000 was raised through subscription of stockholders.

Harpham was named receiver of the company Jan. 17, when the former officers were indicted on charges of violating the Ohio blue sky law.

New officials under the reorganization claim they will have assets sufficient to cover the firm's entire liabilities of \$120,000. They also announce plans are being made for resumption of production some time next month.

## COAST A. E. A. MAKES PROGRESS

SAN FRANCISCO, Sept. 27—The Automotive Equipment Representatives Association, with headquarters in this city, has made substantial progress since its organization a short time ago. Manufacturers' agents on the Pacific Coast are eligible to membership. One of the main purposes of the organization is to see that sales are made exclusively to jobbers.

## CREDIT MEN MEET OCT. 7

NEW YORK, Sept. 26—The second annual convention of the Automobile Financing Credit Men's Assn. will be held at Cleveland Oct. 7. Fred Weber, Jr., of the Bankers' Commercial Security Co. of New York, is president of the organization. His report will show that the 30 members of the organization have financed the sale of 300,000 motor vehicles valued at \$400,000,000 in the past two years.

## Deficiency Payment Extended by Senate

**New Draft of Tax Bill Would  
Allow 18 Months to Elapse—  
Passage Before Nov. 1**

WASHINGTON, Sept. 26—In the Senate tax bill, which Senator Penrose formally reported to the Senate to-day, there is an amendment in Section 250 of part 4 of the administrative provisions which is intended to relieve the taxpayer in case of additional assessments made without complete knowledge of all taxes in the case. The new provisions proposed by the Senate Finance Committee would extend the time for the payment of deficiencies to eighteen months from the passage of the revenue act. This change is of vital importance to the lumber industry and other branches of trade affected by the decision in the LaBelle Iron Works case.

### Provides for Bond

Paragraph "F" of Section 250 makes this provision and authorizes the Commission of Internal Revenue to require taxpayers to furnish a bond with sufficient sureties conditioned upon the payment of deficiencies, in accordance with the terms of extension granted. It is provided that in lieu of other interests provided by law as a part of such deficiencies, the rate of interest on these sums shall be two-thirds of one per cent per month from the time the extension is granted, except where such other interests provided by law are in excess of interest at the rate of two-thirds of one per cent.

If the deficiency or any part of it is not paid in accordance with the terms of the extension, the treasury would be authorized to add, in lieu of other interests and penalties provided by law, the sum of 5 per cent of the deficiency and interest on the deficiency at the rate of 1 per cent per month from the time it becomes payable, in accordance with the terms of the extension. These provisions were drafted to prevent undue hardships to lumber men and others who are obliged to pay back taxes, in accordance with the Supreme Court Decision in the LaBelle case.

### Passage Before Nov. 1

The Senate leaders expect to pass the tax bill before Nov. 1. It now appears that there will be a long debate on the various provisions of the House bill as amended by the Senate committee.

In the report of the majority from the Committee on Finance it was stated that the recommendation for the excess profits tax repeal was based upon a study of its inequities. It was pointed out that the excess profits tax bears less severely upon large than upon small corporations and in practice it exempts the over-capitalized corporation, penalizes business conservatism and places upon the Bureau of Internal Revenue tasks which are beyond its strength.

## Will Consider How To Assist Dealers

### N. A. C. C. Members to Take Up Question of Financing Them for Winter

NEW YORK, Sept. 28—The National Automobile Chamber of Commerce members' meeting at headquarters here next Thursday will be one of the most important sessions ever held by that organization, from the viewpoint of dealers. It has been decided to eliminate from the discussion such subjects as taxation and highways, important as they are, and get down to topics which are vital to the industry.

The first question which will be taken up will be, "How can manufacturers help dealers to carry cars next winter?" In the discussion various plans for financing dealers so that they can carry stocks and keep factories in production will be outlined. There will be no formal address but discussion leaders have been appointed to open the debate.

The second important problem to be taken up will be, "What can be done by manufacturers to help solve the used car problem?" Manufacturers realize as keenly as dealers that some satisfactory solution must be found for this question before the industry can be thoroughly stabilized.

Space for the annual shows at New York and Chicago will be drawn in the afternoon.

The truck manufacturers who are members of the organization will hold a session Friday, at which they will consider means of financing the motor truck distributor, prompt handling of motor truck paper by banks, and vocational selling of trucks.

## Metal Trades Advance 10 Per Cent in August

MILWAUKEE, Sept. 26—The most encouraging report made within a year's time concerning the condition of business in Milwaukee and vicinity is that contained in the current issue of Business and Financial Comment, published monthly by the First Wisconsin National, Milwaukee's largest bank. The review credits the automotive industries with much of the responsibility for the improvement. It says in brief:

"The drift of business in Milwaukee may be tested by three factors—capacity of operation, number of men employed, and sales. The metal trades as a whole increased their capacity of operations about 10 per cent in the last month. For this result the automotive group was largely responsible, as will be seen from the figures of employment. Iron, steel and their products lost 1.8 per cent in number of employees, and metal products other than iron and steel lost 20.3 per cent, while the automobile, parts and accessories group gained 23.4 per cent. In the whole metal trades group sales were about 30 per cent better in August than in July, but com-

pared with August, 1920, they were about 40 per cent smaller.

"From somewhat scattered sources of information it appears that quantity of production in Milwaukee and vicinity reached its lowest point about last April or May when operations in iron, steel and machinery were rapidly falling off and improvement in automobiles, textiles, leather and shoes had not yet made much headway. Since that time there has been a slow but steady climb in production, quickened in the last thirty days by a slightly better showing among some metal trades firms. Production as a whole is not back to that of last September, since at that time iron and steel products and automobiles had not yet slowed down appreciably. Production in September, 1920, can be estimated at about 80 per cent; the lowest point about 60 per cent, and at present about 75 per cent."

As the keynote of the current summary, the following is given: "Business moved slowly in the past month, but it was the first month in over a year in which there were no discouraging slumps. The balance for the month inclined to the favorable side. . . . People have reason to be telling one another that 'the worst is over' or that 'business is picking up some'."

## British Tire Makers Feel Effects of Cuts

LONDON, Sept. 16 (By Mail)—The position of the British tire trade reflects the conditions prevalent in the general industry. Report is rife of tires being sold at 50 per cent less than their listed rates, with the names of the manufacturers taken off. Therefore it was not unexpected that the Leyland & Birmingham Rubber Co., one of our biggest miscellaneous rubber-making companies, should show a deficit on the year's working up to June 30 last. The amount is \$100,000 (at par), whereas last year's return showed a profit of \$432,000 and 15 per cent dividend was paid. In May last year the company issued 125,000 shares at a premium of nearly \$2 each, which emphasizes the set-back suffered within the past few months.

## New Goodyear Truck Delayed by Detours

AKRON, Sept. 27—The Goodyear multiple wheeled motor truck reached Los Angeles, Cal., on Sept. 24 on its first trans-continental run, according to word received here. The truck left Akron with a load of rubber heels, on Sept. 8, in charge of M. D. Scott.

It is the first time a multiple wheeled motor truck has been seen on the Pacific Coast. The truck made fast time from Akron to Kansas City, but encountered bad roads and long detours through New Mexico. It had been planned to reach Los Angeles by Sept. 20, the detours delaying the trip four days.

The truck's run does not come up to the record of the conventional truck for the Akron-Los Angeles run. Two years ago a four-ton Packard four-wheeled truck made the trip in eleven days and 22 hours elapsed time.

## Aim to Avert Slump in Car Repair Work

### Service Associations Will Spend \$16,000 to Bring Business in Winter

NEW YORK, Sept. 26—Automotive Service Associations of New York and Brooklyn are preparing to spend \$16,000 on an advertising and direct mail campaign to avert the usual slump in winter automobile repair work. The appeal will be carried to the car owner to have the overhauling work which usually is put off until early spring done during the winter. Brooklyn started the movement a few weeks ago and mapped out the plan. An initial appropriation of \$4,000 to be secured through voluntary subscription of members was made. New York later joined the movement with a \$12,000 appropriation.

The plan is to use quarter page advertisements in several daily newspapers, some morning and some evening, spreading these out so that every other day or every third day during the months of October and November one paper will carry the advertisement. No individual names will appear in this advertising, but the signature will be that of the association. The copy will be prepared especially to get the interest of the car owner and set him to thinking of the advisability of having his work done early. To follow this up and clinch the argument, there will be 50,000 folders printed in two colors, also bearing the emblem of the service association, but with the name and address of the firm that has subscribed to the fund.

The financial arrangements are such that the fund will be raised by subscriptions of \$100 each. Of this amount, \$25 will be paid on the signing of the contract and the balance in installments covering the ten weeks that the campaign will run. The associations will, therefore, have at all times money in the treasuries from the subscribers in advance of the time that that money will be needed.

### Subscribers Benefited

Subscribers to the fund will get the general advantage of the newspaper advertising and have their names printed on the folders. Non-subscribers to the fund who are members of the association will, of course, derive some benefit from the advertising, but they will not be able to follow it up. The prestige of the associations will be advanced and membership in them will, therefore, become more valuable.

The campaign in Brooklyn is in full swing and the campaign in New York has just started. Forty teams of two men each are visiting responsible firms and asking for their subscriptions, carrying with them samples of the advertisements and folders. The first half hour of the drive resulted in six subscriptions, so the plan is evidently being favorably received.

## Seiberling Shortly to Control Portage

### Acceptance of Offer of \$750,000 for Property Recommended by Former Officials

AKRON, OHIO, Sept. 26—Frank A. Seiberling, founder and former president of the Goodyear Tire & Rubber Co., soon expects to be in control of properties of the Portage Tire & Rubber Co. at Barberton. Control of the Portage plant will practically complete Seiberling's plans for the staging of his "come back" in the tire industry, following his resignation as Goodyear president under the refinancing and reorganization of the company several months ago. Edward G. Wilmer, representing eastern financiers, is his successor at Goodyear.

Seiberling already controls the Star Tire & Rubber Co. of Akron and the Lehigh Rubber Co. of New Castle, Pa. He is negotiating both for the Republic tire plant at Youngstown and the Marion Tire & Rubber Co. at Marion, Ohio, it is reported. Acquisition of these together with the Portage will give him a chain of small rubber companies capable of a combined production of over 10,000 tires daily.

Seiberling's offer of \$750,000 for the Portage property, made before Judge C. D. Westenhaver of the Federal Court at Cleveland, is the highest offer made, and its acceptance has been recommended by deposed Portage officials and by George D. Bates, trustee of the company. The court's approval of the Seiberling offer is expected before Oct. 1. Seiberling plans to resume production immediately with a force of several hundred men and eventually to employ 1500 men in the plant.

Portage stock is carried at a book value of \$2,100,000. When appraised recently its value was placed at \$1,500,000. Mr. Seiberling's offer is half of the latter figure, payable in 7 per cent preferred stock, the title of the common stock to revert to the holding company to be formed.

Seiberling, it is stated, proposes to pay \$750,000 in stock to the fabric creditors of the Portage company and the balance at the inventoried figure in cash to take care of other claims of creditors.

The Portage company has a capacity of 3000 casings and 2000 tubes daily.

## Better Feeling Apparent at Indianapolis Plants

INDIANAPOLIS, Sept. 26—While there has been no increase in the volume of production in Indianapolis motor car plants, there has been a slight increase in the production of the accessory plants. Shock absorber, windshield device and body manufacturers are more optimistic than they were thirty days ago. They state that while orders show only a slight increase and in some in-

stances none, there is a much better tone and inquiries are more numerous. There appears to be an easier money situation, which up to the present time has been reflected only at the banks.

Credit conditions as yet are not good, although these are expected to improve during the next thirty days. Bankers here, following the recent report of the Federal Reserve Bank, particularly the Chicago district, are in a much better frame of mind. The financial situation, they say, is not what it should be, but it has improved so much lately, they feel the worst has been passed. While no announcement has been made it is the general feeling that the interest rates will be dropped before another month or at least before the first of the year.

## Receiver for Lorrain; Reorganization Likely

INDIANAPOLIS, Sept. 26—Walter S. Butler has been named as receiver for the Lorrain Car Co. of Richmond, by William A. Bond, judge of the Wayne Circuit Court, in compliance with a petition filed by D. H. Cummings, president of the company. The company manufactures motor hearses and has become financially involved as a result of the business depression. The liabilities are approximately \$35,000.

The company was incorporated with a capital of \$1,500,000, of which \$1,000,000 was to be common stock; \$150,000 first preferred stock, \$350,000 to be second preferred stock. Of the common stock, \$250,000 has been issued; of the first preferred stock, the entire issue has been sold and is said to be protected by customers' notes. Of the second preferred stock only a small amount has been issued.

It is said that the concern probably will be reorganized and the business taken over following an adjustment of its affairs under the receivership.

## STATE DEALERS ORGANIZING

ST. LOUIS, Sept. 26—Preliminary work for the organization of State dealer associations in Pennsylvania and New York has been completed by the National Automobile Dealers Association. Delegates from local associations in Pennsylvania will meet at Harrisburg Oct. 5 to adopt a constitution and by-laws and arrange for a State convention to be held in the Capitol building in that city in November. In New York State, delegates from local associations will meet in Syracuse about Nov. 20, when preliminary organizing steps will be taken and plans made for a general convention probably to be held in December.

## ACCEPT HARPER BEAN PLAN

LONDON, Sept. 5 (*By Mail*)—Creditors of the Harper Bean interests have accepted the plan for the continuation of the company's trading. The creditors will receive at the rate of 3s. 4d. (nominally 80 cents) per £1 (nominally \$5) of debt.

## Ames Advises More Aircraft Research

### Resumption of Scientific Activity Urged Upon Manufacturers by Aeronautic Chief

WASHINGTON, Sept. 26—Re-establishment of research laboratories maintained by aircraft manufacturers, many of whom were directly associated with the automotive industry, has been recommended by Dr. Joseph S. Ames of the National Advisory Committee for Aeronautics. In a statement to-day, Dr. Ames stated that civilian aviation demands the development of cheaper, more reliable and more efficient aircraft and that the advisory committee favors the continuous prosecution of scientific research and experimentation for the development of aircraft for any purpose. He deplored the discontinuance of this activity.

It is the contention of Dr. Ames that civilian aviation must be developed, for in the last analysis it should be the main support of the industry in time of peace. He has suggested that Congress take immediate action on the aviation bills which have been introduced, that is, for the establishment of the Bureau of Air Navigation in the Department of Commerce. Dr. Ames regards the situation as serious from the standpoint of industrial development and particularly national defense. It is his contention that the recent bombing tests of airplanes versus battleships off the Virginia capes have served to indicate the great possibilities of aircraft in coast defense and naval warfare, and to accentuate the demand for progress in aeronautical development.

Dr. Ames pointed out that in the present demand for economy in government there is danger that the development of aviation may be unwisely retarded. He stated that economy can be wisely effected only where economy is possible without retarding necessary development, and that it will be a mistake to retard the development of aviation.

## Airplane Design Topic at Dayton S. A. E. Meeting

DAYTON, OHIO, Sept. 26—The Dayton section of the Society of Automotive Engineers will open its season with a meeting on Oct. 4. I. M. Laddon, chief of the airplane design branch, Engineering Division, U. S. Air Service, will give a talk on all-metal airplane construction. The meeting will be held at the Engineers' Club at Dayton, Ohio. The talk will cover internal bracing, the use of steel and duralumin as tubing, wing covering, etc. The paper will discuss advanced types of airplane design such as the Dornier Zeppelin airplane and monoplane, Junker monoplane, Fokker monoplane and biplane, Brequet and others.

## Peerless Stock Up Under Transfer Deal

Rises 15 Points—Stockholders  
Requested to Deposit Shares  
Before Oct. 10

CLEVELAND, Sept. 26—The deal for the purchase of the controlling interest in the Peerless Truck & Motor Corp. of this city has reached the point where an outline of the sale has been given to stockholders of the corporation. Although negotiations were still in progress between R. H. Collins of Detroit and associates and B. G. Tremaine, president of the corporation, and his associates, notices setting forth details of purchase were sent to stockholders through the mails.

The purchase will be made on the basis set forth in previous dispatches from Cleveland. Collins and his associates are to take over 50,000 to 80,000 shares of the company and pay \$50 a share. Of the purchase price \$10 will be paid in cash and there will be six deferred payments totaling \$40 a share. These will be in six equal installments semi-annually over a period of three years. The deferred payments will be secured by a trust agreement under which there will be deposited as security for the personal obligations of Collins and associates all of the shares sold and additional security covering the first two installments of principal. After these two installments are paid, the notice says, the only security which the stockholders will have will be the shares themselves but the amount of the indebtedness so secured will be reduced to \$26.67 a share.

### Recommend Acceptance

The notice, which is signed by B. G. Tremaine, president, and F. S. Terry, also an executive of Peerless, states that "we and our associates are favorable to Mr. Collins' proposition, and will recommend its acceptance to our friends. The furnishing of the minimum of 50,000 shares is therefore practically assured. Our attorneys, Mr. Tremaine and G. B. Siddall, probably will make the sale when the minimum of 50,000 shares is deposited with the Cleveland Trust Co. All stockholders who sign the agreement and deposit their shares on or before Oct. 10 will participate in the sale. Agreement and shares received later than that date will be returned."

The notice then proceeds to ask stockholders to deposit their stock in escrow with the Cleveland Trust Co. so that they may participate. This request would indicate that Tremaine and his associates have not yet obtained under proxy all of the stock that Collins and his associates desire.

Collins was in the city to-day and was in conference with officers of Peerless at the plant. The deal, which involves the payment of practically \$4,000,000 is expected to be consummated shortly.

The Peerless stock sold to-day on the exchange here for 38, a rise of 15 points

## HORSE PROPAGANDA REFUTED IN CANADA

CHICAGO, Sept. 26—The responses received from a questionnaire sent to 5000 Canadian tractor owners by the International Harvester Co., show that tractors are being operated this year despite the many conditions unfavorable to their use. Only 15 per cent of those answering the questionnaire stated that they had not used the tractor this year.

The questionnaire was sent out in an effort to refute the propaganda of the Horse Association of America which stated that but 5 per cent of the tractors in the Canadian Northwest were in use this year, and as a result of this condition an investment of over \$42,000,000 in tractors in this section was disappearing in depreciation.

since the first rumors of the approaching deal were heard. When Collins takes over the management it is reported that sales promotion work will be carried on on a much larger scale than it has ever been. Every effort possible will be made to increase the prestige of the Peerless products throughout the world and it is expected that production will be increased greatly.

## First Show in China Scheduled for November

WASHINGTON, Sept. 26—Trade Commissioner Lynn W. Mekins advises manufacturers of automobile accessories and automobiles in this country to make arrangements with exporters for an exhibit of their products at the Shanghai Automobile Show, to be held during the week of Nov. 26 to Dec. 3, the first exhibit of that character ever held in China.

He points out that in order to reach Shanghai in proper time, it would be advisable to ship samples of accessories and other display material through parcel post or express by way of the Pacific. The existence of a branch of the United States Post Office at Shanghai enables parcel post shipments to be made under domestic rates and conditions. A majority of the best known American, French and British automobiles will be displayed by local representatives. A list of importers of and dealers in automobiles and automobile accessories in China may be obtained from the Bureau of Foreign and Domestic Commerce.

### ADDS STANDARD EQUIPMENT

CLEVELAND, Sept. 26—The Grant Six has added as standard equipment wood disk wheels, spare cord tires, Neville sliding steering wheel, drum shaped headlamps, parking lamp on the cowl and bumpers in both front and rear.

## California Trade Shows Slight Drop

Will Feel Effects of Oil Field  
Strike If Acute Situation  
Develops

LOS ANGELES, Sept. 26—The continuance of the demand in southern California for motor equipment surpasses understanding. In June, it was predicted, the peak had been reached when the 10 counties passed the 5000 mark in registrations. This seemed to be borne out when July showed a slight decline, but August followed with a gain that not only passed the previous month's figures but was more than 100 in excess of June. September probably will fall slightly behind August, but indications are that the predicted slump has been postponed for at least one more month.

Dealers and others closely identified with the trade have quit trying to guess business prospects. The air has been filled with a belief that business would have to get much worse, because of conditions in other parts of the country, but the time has not arrived, according to the figures. At the end of August there had been 33,681 new motor cars and trucks registered in southern California as against 29,375 for the same period the year previous. August reported 5384 new passenger cars, of which 2333 were Fords, and 500 trucks and commercial cars, of which 220 were Fords.

There is no doubt but that if the strike in the oil fields that now is waging brings about an acute situation, the automotive trade will feel the effects. Kern County, the heart of the oil district, is one of the most thoroughly motorized sections in the entire State, and a complete tieup in operations will paralyze all kinds of industry there. In Los Angeles County the banks that have taken over a liberal quantity of both trucks and passenger cars have begun selling them at far below the original list prices. It cannot be told at this time how serious will be the effect of this class of trade. Truck dealers are likely to feel it more than the passenger car dealers.

### MAY SELL SCOUT MOTORS

LONDON, Sept. 16 (*By Mail*)—The affairs of Scout Motors, Ltd., at Salisbury, one of the oldest British automobile makers, are being revived by the court. The company, though never at the front of the industry, had a fair reputation for a mid-grade car but had a bigger market for their "Scout" trucks. The gross debts are declared at \$158,770 and the assets taken at a forced sale value are valued at \$50,000. The official report on the company's affairs suggests a possible sale of the company, but adds the significant remark, "the present position of the motor industry is not very favorable."

## September Business Is Exceeding August

### Slight Decline in Some Sections Balanced by Increases in Others

NEW YORK, Sept. 26—The feeling of confidence engendered in the automotive industry by the unexpectedly good business of the summer months is being sustained by the September sales showing and the belief that there will be no serious slump in trade in October or November.

Liquidation of high priced inventories by passenger car makers is rapidly nearing completion, and they are buying supplies at the market. There also has been a gratifying increase in the efficiency of labor. These two factors together have been responsible in no small degree for the substantial price cuts which have been made and which have been passed on to the "ultimate consumer," in marked contrast to the situation in many other lines.

There is a striking disposition throughout the industry to be mutually helpful. The parts and accessory manufacturers are fully alive to the difficulties confronting the vehicle makers and are disposed to assist them in every way possible. In respect to inventories and labor, the parts makers are in much the same position as the car manufacturers. This has been reflected in substantial reductions within the past few days in some of the most important unit parts used in assembled cars.

#### Business Better in South

While there has been a slight falling off in sales of passenger cars at retail in the great industrial districts, this has been balanced by increased business in the South and in the leading agricultural sections where farmers are liquidating their bank indebtedness and are replacing some worn automotive equipment. Reports of better business in the South are particularly encouraging.

It is notable that the feeling in Detroit is increasingly hopeful. Employment figures for that city show that there has been no decline in the number of men employed, although a few more are on part time. Ford production for September will run several thousand behind August, but this is not due to lack of orders but rather to manufacturing complications. Ford sales were stimulated to a marked degree by the most recent price cut, and the company has sufficient orders on hand now to keep it going at capacity until Nov. 1. Dodge, Studebaker, Buick, Nash and Reo are behind on deliveries. An indication that the companies in the higher priced class are feeling the beneficial effects of the generally brighter outlook is found in the fact that September will be the best month the Lincoln Motor Car Co. ever has had.

## SMITHS LOOM LARGE AS POTENTIAL BUYERS

DETROIT, Sept. 26—Eleven and five-tenths per cent of the Smiths are buying automobiles this fall and winter.

This information was solicited by a leading farm journal by sending out a questionnaire to the 12,824 Smiths listed among its 1,100,000 subscribers. The idea of this means of getting a line on what farmers were going to do with their money suggested itself to a man named Smith in this journal's research department.

By applying the percentage of Smith car buyers to its total subscription list, the journal estimated that 126,500 cars will be purchased by its 1,100,000 readers. Of this number the questionnaire revealed that 116,200 had already determined upon the make of car they will purchase.

The entire industry is centering its attention to a greater degree than ever before on the question of service and the needs of car owners. This probably will result in fewer complaints in the future about high upkeep costs and unsatisfactory repairs.

## Two Days for Next French Grand Prix

PARIS, Sept. 17 (*By Mail*)—Next year's French Grand Prix race will be a two-day event for two different types of cars. Racing cars will be run on one of the days under a piston displacement rule, but the national club is undecided whether to retain the present 183 cu. in. rule or to drop to 122 cu. in. The smaller piston displacement has a big following, but if adopted for next year, it will eliminate all foreign competition, for the 183 cu. in. rule has been decided on in England, America, Italy and Belgium. The second race will be for stock cars having minimum body dimensions and a limited amount of gasoline and oil. This event will be quite independent of the one for purely racing cars, although run over the same course. It has yet to be decided where these two races will be held. The date probably will be early in July.

#### E. W. BROOKS DIES SUDDENLY

CADILLAC, MICH., Sept. 27—Announcement has been received here of the sudden death in Kansas City of E. W. Brooks, field representative of the Acme Motor Truck Co. He had been factory representative of the company in the Southwestern States for three years and had just returned to Kansas City from a long business trip when he suffered a stroke of apoplexy in the lobby of his hotel.

## Cotton Prices Boom Georgia Industries

### Increased Employment and Bank Clearings Reflect General Im- provement in Conditions

ATLANTA, Sept. 26—That there has been material improvement in business in Georgia during the past five or six weeks is indicated by a report of the State Department of Commerce and Labor issued the latter part of this month, which states that Georgia industries are now employing more persons than at any time during the past seven months. The increased price of cotton is responsible for the betterment in employment conditions, and if the price holds around the 20 cent per pound level still further improvement is anticipated during the coming month.

Material improvement is shown in employment conditions in virtually all of the southern States the past five or six weeks, or since cotton began its steady advance, according to reports received in Atlanta.

Bank clearings in Atlanta also show a large and steady increase. Clearings the third week in September were larger than any single week since last January, the increase each week amounting to several million dollars the past month.

#### Increase at Ford Branch

The Atlanta branch of the Ford Motor Co. reports a tremendous increase the past few weeks in Ford car and truck sales, the South leading all the other districts in the percentage of gain since the latest price reduction. The increase for the Atlanta branch has been 63 per cent, and this branch now has approximately 1000 unfilled orders on hand. A good sign of the general business improvement is the fact that there has been an enormous increase lately in the sale of Ford cars to commercial houses for the use of salesmen in covering their territories.

P. A. Megahee, secretary of the Georgia Automotive Dealers Association, has just completed a trip throughout the State, visiting the various local dealer organizations, and reports that everywhere he visited increased cotton prices have been reflected in increased automobile sales, especially among the smaller dealers. There is a much better feeling among the dealers in the smaller towns than there has been for more than a year, and their general opinion is that the industry is close to normalcy.

#### CITIZENS VISIT TIRE PLANT

HOLYOKE, MASS., Sept. 27—More than 5000 citizens inspected the new plant of the New England Tire & Rubber Co. at its formal dedication. The inspection was preceded by a meeting of the stockholders at which officers and directors were named. John Kearns is president of the company, C. D. Huntley, treasurer and general manager, and J. S. Bernstein, secretary.

## Goodyear Production Neared Peak Volume

### Wilmer, After Survey, Says Buy- ing Is Being Done on Close Lines

AKRON, Sept. 26—Summarizing operations in the rubber industry during the past half year, following a complete survey of Goodyear properties which included trips to Canada, Arizona and California, President Edward G. Wilmer of the Goodyear Tire & Rubber Co. expresses the conviction that the foundations are being soundly laid for the future stability and progress of the industry.

"Our sales during the summer season have exceeded our expectations of last spring. There was a larger use of automobiles than we had thought there would be, compelling our production of tires to go within as high as 85 per cent of its peak volume," states Mr. Wilmer. "Part of this was due undoubtedly to the fact that there had not been the normal buying during last fall and winter. Neither consumers nor dealers did any stocking up this summer, and they are still buying carefully from hand to mouth."

### Three Plants Surveyed

Mr. Wilmer's trip included surveys of the Goodyear tire plants in Toronto, Canada, and Los Angeles, Cal., and the company's cotton plantation in Arizona.

"At the Canadian plant at Toronto they have completed their readjustment to new conditions and are moving ahead. Progress is being made in the domestic field and even more encouraging progress in export," states Mr. Wilmer. "All along the Pacific Coast we found business conditions were better than in the country generally. They have felt the readjustments much less than we have in the East. I was more than pleased over the new Goodyear factory at Los Angeles. It is a wonderful plant and ideally adapted to serve its purpose. Our California factory reached a peak production of 4100 tires a day this summer. A larger volume of business that will use proportionately more of its facilities will greatly improve its showing, but already it is meeting the demands upon it, both from the standpoint of production and current earnings."

"In Arizona, where the company has its cotton plantations, I found a section of America which had gone through great reverses during last winter and spring, but which is now showing real signs of revival."

"They had in the Salt River Valley 180,000 acres in cotton last year. They had only been in the business of raising long staple cotton for three or four years, and were not prepared to carry them through a year in which the prices of their product slumped substantially under the cost of production."

## Piston Displacement Values Shown by Race

BRESCIA, NORTHERN ITALY, Sept. 8 (*By Mail*)—An average of 72 miles an hour was maintained by Ernest Friedrich in to-day's 215-mile race, with a four cylinder Bugatti having a piston displacement of only 91.5 cu. in. This constitutes a world's record for cars

of this size and is a higher speed than was attainable in 1914 with engines of twice this piston displacement.

The Bugatti cars, which weighed 1100 pounds, had a four cylinder motor of 68 and 100 mm. bore and stroke, with four valves in the head operated by an overhead camshaft, with vertical bevel gear drive. The crankshaft was carried in three ball bearings, and roller bearings were used for the connecting rod ends. Ignition was by a couple of high tension Bosch magnetos carried on the aluminum dash and driven from the overhead camshaft by a horizontal shaft with a couple of flexible fabric couplings.

The high speeds attained in this race, the small amount of mechanical trouble, the economy in tires, which gave such good service that they never influenced the result, and the high degree of perfection which has been attained in getting these 1100 lb. cars to hold to the road, all confirm the conviction that the 183 cu. in. limit is too high for racing purposes.

## No Distributors Rumored in Willys-Overland Plan

NEW YORK, Sept. 28—Reports in circulation among wholesale and retail representatives of Willys-Overland, Inc., are to the effect that the company is about to eliminate the distributor from its plan of marketing Willys-Knight and Overland cars. It is said that dealers will operate directly under branch sales managers. Each branch will have several hundred dealers under its direction under this plan. It is reported that sales territory throughout the country will be redistributed.

## Rickenbacker Acquires Former Disteel Plant

DETROIT, Sept. 26—Rickenbacker Motor Car Co. has taken over the Disteel Wheel plant of the Detroit Pressed Steel Co. in a deal which affects four companies in the industry importantly. It is one of the first of a number of plant changes which may be expected this fall and winter, all making toward the solidification of the companies concerned.

Besides Rickenbacker and Detroit Pressed Steel, the companies in the present deal are Briggs Mfg. Co., body builders, and Everitt Bros., body painting and trimming. Everitt Bros. will consolidate its business in its East Jefferson Avenue plant, while Briggs Bros. will practically double the space occupied in its former plants.

The plant has now been sold to permit Detroit Steel Products to consolidate its manufacturing units in the Mt. Elliott Avenue plant. Each of the companies involved in the deal is already in the new plants. All of the Rickenbacker offices are now at the former Disteel plant. President B. F. Everitt said that production will be under way on all models in December though no shipments will be attempted until January.

## Conservatism Marks Philadelphia Trade

### Sales of Lighter Trucks and Lower Priced Automobiles Show Improvement

PHILADELPHIA, Sept. 26—Trucks, particularly those of smaller capacities and lighter construction, are having a better sale than for some time in this city and vicinity, but only under the constant spur of salesmen's contests in which prizes or bonuses figure and through readjustment of territory and increased energy on the part of sales managers. Sales of lower priced automobiles are picking up and while business is not yet on a normal basis, buying is more systematic and inquiries are more frequent. Many of the dealers are still engaged on cutting down their sales and service operating expenses. One economical step that is becoming general is the drastic cutting-down of the number of salesmen's cars and demonstration cars. It is noted that most customers who are buying cars for their personal use are more conservative.

Accessory dealers report that business, at the end of the summer, is becoming more active, yet not as active as had been hoped. Tire manufacturers in this territory report the summer sale of their products as good. While they expect a slowing up of business with the end of the summer motoring, they are optimistic as regards future trade.

Tire dealers report that there is a heavy demand at present for tires for small cars which have had big price reductions. These sizes are far outselling the larger sized tires. Companies supplying tires to automobile manufacturers in the territory, including southern New Jersey, say that they have felt the slump that affected the industry. Old debts have been paid for the most part, although collections have been slow, and the majority of companies are starting on a new basis.

### LEE MAKING NEW TIRE

NEW YORK, Sept. 26—The Lee Tire & Rubber Co. is producing a new tire known as the Lee 22 Zig Zag, priced at \$13.75, and suitable for Ford, Maxwell, Overland and Chevrolet cars. This figure has been fixed, the company states, in anticipation of 1922 prices.

### CORRECTION

NEW YORK, Sept. 27—The statement was made in a survey of automotive conditions in Mexico, printed in AUTOMOTIVE INDUSTRIES, Sept. 1, that Messrs. B. Estades & Cia are the Pierce-Arrow distributors in Mexico City. This was an error, for the distributors of the Pierce-Arrow line in Mexico City are Compañia Automotrix Mexicana, S. A. This company has had the exclusive franchise for Pierce-Arrow in Mexico for several years.

## Truck Association Closes Headquarters

### Business of Chicago Organization Will Be Conducted Through Informal Meetings

CHICAGO, Sept. 27—At a meeting of the board of directors of the Motor Truck Manufacturers' Association held here, it was decided to close the association office and dispense with the services of the manager and staff. At the suggestion of B. A. Gramm, vice-president of the Gramm-Bernstein Motor Truck Co., an association member, it was decided to continue the activities of the organization through the medium of occasional meetings of such members as may remain in the association.

The reasons given for the closing of headquarters and the virtual dissolution of the association are that the present state of the motor truck industry does not justify the expense of office and staff, and the lack of financial support from its members.

The Motor Truck Manufacturers Association was organized in April, 1918, for the purpose of ready exchange of parts among manufacturers under contract with the government to build army type B trucks. Later the activities of the organization were broadened to cover such points as legislation and general expansion of the industry. The association started with 14 members. This number was raised to 55 but dropped to 31. David Thomas has been manager of the association since its organization.

## Hupp Changes Prices on Enclosed Models

DETROIT, Sept. 27—Hupp Motor Car Corp. has reduced prices on its enclosed car models to \$2,250 and \$2,200 for the sedan and coupe respectively. The former prices were \$2,285 and \$2,400. No changes are made in the models, the lower prices being effected through manufacturing economies. The price of the open models, \$1,485 for touring and roadster, remains unchanged.

### KISSEL TRUCKS DOWN

HARTFORD, WTS., Sept. 26—Reductions ranging from \$600 to \$1,000 on its line of trucks are announced by the Kissel Motor Car Co. The prices follow:

	New Price	Old Price
Utility model 1½ ton....	\$1,975	\$2,775
Freighter model 2½ ton.	2,875	3,475
Heavy duty model 4 ton	3,675	4,475
Goliath model 5 ton.....	4,085	5,085

### ANOTHER CUT BY ANDERSON

ROCK HILL, S. C., Sept. 26—The Anderson Motor Car Co. announces another cut in prices on its various models. It covers the new line which is now being turned out. Economies in manufactur-

ing and distribution have made the cut possible. The price list follows:

	New Price	Old Price
5 passenger touring..	\$1,650	\$1,795
7 passenger touring..	1,795	1,845
Coupe .....	2,450	2,795
Sedan .....	2,550	2,795

No change has been made in the price of the two passenger speedster which remains at \$2,195.

### SAXON MAKES CUT

DETROIT, Sept. 26—The following price reductions are announced by the Saxon Motor Car Corp.:

	Old	New
2 passenger roadster.....	\$1,545	\$1,345
5 passenger touring.....	1,495	1,295
Coupe .....	2,295	1,995
Sedan .....	2,295	1,995

### R. & V. KNIGHT REDUCES

EAST MOLINE, ILL., Sept. 27—Reductions have been made on the R. & V. Knight, Model R, as follows:

	Old	New
5 passenger.....	\$2,150	\$1,500
Coupe .....	2,850	2,650
Sedan .....	2,950	2,750

### STEPHENS SALIENT SIX DROPS

FREEPORT, ILL., Sept. 27—The Moline Plow Co. has announced that the Stephens Motor Works has reduced prices on the Stephens Salient Six, effective Oct. 1, as follows, all prices f.o.b. this city:

	New Price	Old Price
6 passenger touring..	\$1,850	\$2,065
4 passenger touring..	1,850	1,985
Sedan .....	2,850	3,100
Sedanette .....	2,850	3,100
Roadster .....	1,800	1,900
Special sport model...	1,950	2,085
Special roadster.....	1,900	2,000

### RESUME REPUBLIC DIVIDENDS

NEW YORK, Sept. 29—Dividend payments on the preferred stock of the Republic Motor Truck Corp., which is controlled by John N. Willys, have been resumed. The quarterly payment due July 1 was passed. The current dividend of 1½ per cent is payable Oct. 1. Shipments from the Republic factory this month will aggregate 200 trucks and sales next month are expected to exceed this total. This is regarded as indicating a much better trend in the truck market.

### FARMERS AWAIT REDUCTIONS

KANSAS CITY, Sept. 27—The implement trade has suffered more than any other in the past year. Reports indicate that farmers are not yet ready to buy, though their credit is such that now they may enter the obligations. It is said that farmers still believe that implement prices have not been readjusted.

Reports that a further readjustment of prices may be expected in October have aroused discussion as to steps which may be taken to bring about a revival of demand.

## Durant Is Producing at Long Island Plant

### Scheduled Output Set at 50 to 60 Cars Daily—Will Be Increased

NEW YORK, Sept. 29—The Durant Four now is in production at the Long Island City plant and the scheduled output for next week is between 50 and 60 cars a day. Production will be steadily increased. The automatic machinery has been placed and the company contends that a record has been made in getting an entirely new car into production in seven months. Production in the Lansing plant will begin about Nov. 1. The output for the year at the Long Island City plant will be between 4000 and 5000 cars.

Durant Motors, Inc., has been informed by the Illinois Securities Commission that it will not be permitted to sell stock in that State on the ground that its securities are "purely promotional and without basis of value." A statement issued by Carroll Downs, vice-president of Durant Motors, states that the attorneys for the corporation advised several months ago that under the Illinois law as it then stood any stock which was listed in the larger stock exchanges of the country was eligible for sale in Illinois. Sale of Durant stock then began but the Illinois law was amended so that admission to the stock exchanges did not make securities eligible in that State. When this amendment was called to the attention of the company sale of the stock was suspended.

## Gear Manufacturers Meet in Rochester

NEW YORK, Sept. 28—The semi-annual fall meeting of the American Gear Manufacturers Association will be held in the Powers Hotel, Rochester, Oct. 13, 14 and 15. Reports will be presented by the various committees on standardization. The program will include papers on "Gear Tooth Wear," by S. O. White, chief engineer of the Warner Gear Co., Muncie, Ind.; "Duralumin as a Material for Worm and Other Gearing," by R. W. Daniels, Bausch Machine Tool Co., Springfield, Mass.; "The Grinding of Gear Teeth and Its Future in the Industry," by J. F. Barr, secretary, The Gear Grinding Machine Co., Detroit, Mich.; "Tooth Forms," by E. W. Miller, chief engineer, Fellows Gear Shaper Co., Springfield, Vt.

Arthur E. Sutherland, former justice of the Supreme Court of New York will be one of the speakers at the informal dinner on the evening of Oct. 14. His subject will be "Capital and Labor." Another speaker at the dinner will be Ernest Pavioir, who will talk on "Advertising."

# Big Automotive Merger Proposed

## Several Companies Will Be Included

**Creditors of Jackson Motors Hear of Plan—Combine Involves \$50,000,000**

NEW YORK, Sept. 29—Creditors of the Jackson Motors Corp. will have presented to them at a meeting in Jackson, Mich., to-day a proposal that they sanction entrance of that company into a \$50,000,000 merger of automotive concerns. The plan has been worked out in detail after months of effort by the bankers involved, headed by Ralph Van Vechten, of the Continental and Commercial Bank of Chicago.

Details of the negotiations for the consolidation have been kept a close secret, but it is understood that the companies which will be taken in will include the Traffic Truck Co., the Covert Gear Co. and the Herschell-Spillman Co. Efforts were made some time ago to interest in the plan the interests which control the National Motor Car and Vehicle Corp. of Indianapolis, the Liberty Motor Car Co. of Detroit and the Cole Motor Car Co. of Indianapolis, but these corporations decline to enter the combination.

It is understood also that negotiations have been under way with the Mitchell Motor Co., Inc., of Racine, Wis., and the Gardner Motor Car Co., Inc., of St. Louis. Bankers closely connected with the Mitchell company said to-day that they had heard nothing of any plan of entering such a merger. The interests which control the Mitchell company are identical with those back of the Hupp Motor Car Corp. but there has been no intimation that Hupp was in any way interested in the merger.

C. O. Miniger, who is president of the Electric Auto Lite Corp., a subsidiary of the Willys Corp., is a director of Jackson Motors but it was said here to-day that there was not the slightest possibility of Electric Auto Lite being included. So far as the Willys interests were concerned, it was said, the connection of Miniger with Jackson Motors was merely a coincidence.

While it has been known in banking circles for some time that efforts were being made to form a big combination, little has been heard of it in the trade. Probably the most active workers for it have been Van Vechten, Harold Plimpton, a Boston broker, who is a member of the Jackson finance committee, and Carl L.

V. Exselsen, a Chicago attorney. Exselsen is secretary and treasurer of the Jackson company.

The call sent to creditors of Jackson Motors for the meeting at Jackson to-day, says:

"Very earnest and active work has been done during the past two months preparing a satisfactory solution of Jackson Motors problems. The plans evolved are about to be consummated and the general plan of the entry of Jackson Motors into the merger will be disclosed and acted upon."

The creditors had been informed a few days earlier that under this plan Jackson would become a unit of a \$50,000,000 automotive merger which would be announced about Oct. 1. The executive committee of bankers and others interested has definitely agreed to pay part of the claims against Jackson in cash if the plan is approved.

It is understood that the Covert Gear Co. is one of the largest creditors of Jackson Motors and it has been understood that plans have been under way for a refinancing of the gear company.

Jackson Motors Corp. was incorporated in 1919 to take over the Jackson Motor & Mfg. Co., the United Four Wheel Drive Truck Corp. and the Lamson Truck & Tractor Co. The plant at Jackson covers almost six acres of floor space. It makes a full line of passenger cars and also four wheel drive trucks. The authorized capital is \$3,000,000 common and \$2,000,000 preferred. A general balance sheet of July, 1920, showed assets of \$6,212,742 and working capital of \$1,259,743.

The Herschell-Spillman Motor Co. has a large plant at North Tonawanda, N. Y., and manufactures two types of motors, one a four cylinder for automobiles, light trucks and small tractors and the other a six cylinder for high class automobiles.

The Covert Gear plant is located at Lockport, N. Y., and the company manufactures transmission gears. Alvin A. Gloetznar, the president, is understood to have been prominent in promoting the merger.

The plant of the Traffic Truck Co. is in St. Louis.

## UNDERWRITERS MEET OCT. 3

CHICAGO, Sept 26—The Automobile Council of the Underwriters Laboratories will meet at the Chicago office of the Laboratories Oct. 3, the day before the meeting of the rates committee of the National Automobile Underwriters Conference.

Possible increases in the present standards of the laboratories covering test requirements for automobile bumpers and consideration of a possible grading of automobile locking devices with reference to their merits are among the questions expected to be discussed.

## Tire Standardization Report Is Completed

**S. A. E. Committee and Rubber Association Have Approved Recommendations**

NEW YORK, Sept. 27—The special committee on tire and rim standardization of the Society of Automotive Engineers appointed last December to consider the standardization of tires and rims, has completed its report relating to policy so far as co-operation of the society with the National Automobile Chamber of Commerce and the Rubber Association of America is concerned, and will present its recommendations at the January meeting of the standards committee of the society. The recommendations will then be presented to the society as a whole for action. They have already been approved by the rubber association.

## Pending for Year

At a meeting in Cleveland last year, the decision was reached to appoint a special committee to act in this matter, and subsequently in December, 1920, the council of the society appointed J. G. Vincent, vice-president of engineering of the Packard Motor Car Co.; H. H. Rice of the National Automobile Chamber of Commerce; A. L. Viles representing the Rubber Association of America, and H. M. Crane, also representing the S. A. E., to survey the present practice. The result of the consideration of all questions pertaining to the matter is embodied in the report. If this report is adopted by the society, it will be entered in the official handbook as "S. A. E. Best Recommended Practice," instead of "S. A. E. Standard," as is now the case, the change being due to the alterations in the existing table.

## New Sizes

Three present sizes would be eliminated, 32 x 3½, 33 x 4, 33 x 4½ straight side with the substitution of a 30 x 3½ clincher and 30 x 3½ straight side type, with a 31 x 4 oversize and no regular. The sizes to be recommended as the best practice are as follows:

Tire Size		
Rim Size	Regular Size	Oversize
30 x 3½ C	30 x 3½	31 x 4
30 x 3½ SS	.....	31 x 4
32 x 4	32 x 4	33 x 4½
32 x 4½	32 x 4½	33 x 5
34 x 4½	34 x 4½	35 x 5
34 x 5	34 x 5	36 x 6
36 x 6	36 x 6	38 x 7
38 x 7	38 x 7	40 x 8
40 x 8	40 x 8	42 x 9
44 x 10	44 x 10	.....

## INDUSTRIAL NOTES

Victor Bearings Co., Indianapolis, has acquired all the resources and liabilities of the Modern Die & Tool Co. of that city.

Franklin automobile shipments from the Syracuse factory for the first three weeks of September were over 10 per cent in excess of the same period in August.

Kelly-Springfield Tire Co. plant at Wooster, Ohio, will close down entirely before Oct. 1 and the machinery will be shipped to the new plant at Cumberland, Md.

The American Motors Export Co. will begin work on the initial unit of its plant at Jacksonville, Fla., with the arrival of the first carload of steel, now being shipped from the Virginia Bridge & Iron Works of Roanoke, Va.

The Oshkosh Motor Truck Co. of Oshkosh, Wis., which completed a new plant costing about \$275,000 several months ago, is now in active production. The pumps on the fire engines will be made in sizes having a capacity of 750 to 1000 gal. per minute.

Durant Motors, Inc., has made a contract with Kensley, Millbourne & Co., Ltd., 90 West Street, New York, to handle all its export business. The parent company is referring to the export house all inquiries in regard to shipments of cars to foreign countries.

Wilson Tire & Rubber Co. plant at Springfield, Ill., has been sold for \$12,226.40 at a public auction in foreclosure of a mortgage on the property held by the First Trust and Savings Bank. The purchaser was James A. Easley. It is estimated the plant is worth at least \$200,000.

Charles H. Harris, Inc., dealing exclusively in glass for automobile windshields and enclosed bodies, has completed its factory at Norwalk, Conn., and anticipates operating on full time in the next thirty days. This full capacity is possible through the increased business of the last six weeks.

Scholtz Tool, Gear & Machine Works, Inc., Waterloo, Ia., has added \$10,000 worth of new machinery for a service to automobile and garage owners in cylinder and crank shaft grinding. The firm will manufacture and market a device for hauling disabled cars to repair shops, an invention by O. A. Scholtz, manager and principal stockholder of the company.

The Standard Unit Parts Corp., Chicago, has established a branch house in Milwaukee under the management of W. F. Mark. The company is distributor of Continental motor parts, Borg & Beck clutches, Spicer universal joints, Pierce governors and Hy Duty fans. Of the \$100,000 of authorized capitalization, the Wisconsin investment is given as \$15,000 in the application for a local charter.

The Oshkosh Tractor Co., Oshkosh, Wis., has called for bids for the general construction work on its new \$250,000 factory, including concrete and mason work, structural steel, metal sash, etc. The main building will be 150 x 500 ft., one story, with saw-tooth roof, and is expected to be ready about Dec. 1 or 15. The transfer of the machinery, equipment and materials from La Crosse, Wis., is now under way.

The Victor Bearings Co., Indianapolis, with a capital stock of \$300,000, has taken over the properties of the Modern Die & Tool Co. of that city. The company will engage in the manufacture of bearings for automobiles, trucks, racing cars and airplanes. At the present time it is operating both day and night shifts. It is planned

soon to move the entire plant to a new building that is to be erected near the site of the old.

The Western Reserve Mills Co. of Kent, Ohio, which recently purchased the Quitman Cotton Mills at Quitman, Ga., for the manufacture of fabric used in making tires by the Mason Tire & Rubber Co., has also purchased the Millen Cotton Mills at Millen, Ga., for the same purpose. The freight rates to Ohio were so large that the company purchased these mills outright and will manufacture the fabric right in the cotton growing belt.

The Mason Tire & Rubber Co. at Akron announces that the capacity of the tire department will be doubled by the first of the year. Contracts for the installation of new machinery to provide for the increased production have been let. Alterations in the factory arrangements will take care of the increased production. With the new machinery installed the company will have a capacity for 4000 tires and the same number of tubes a day.

Duty Motor Truck Co. will be given a deed to a tract of land at Elgin, Ill., by the local association of commerce as soon as it removes its plant from Greenville, Ill., and is in actual operation. The association paid \$7,500 for the property and 150 residents of the city have invested in stock of the company. It is expected that the company, which agreed to locate at Elgin if a suitable site was provided, will have its plant completed by spring.

The Perfection Hoist & Engine Co. of Milwaukee, which is moving its plant and headquarters to Two Rivers, Wis., has made a unique departure in the design and production of the self-contained electro-generating unit which it is manufacturing. The Perfection lighting plant is powered with a four-cylinder L-type motor, air-cooled, and the piston rings, connecting rods, valves, springs, tappets, etc., are duplicates of Ford parts, making it convenient and economical for the owner at distant points from the source of supply to make immediate replacement.

The Talbott Rubber Co., Springfield, Ohio, has made application for incorporation papers with capital stock of \$50,000 preferred and 500 shares of no par common. The capital has all been paid in. The company will be a distributing organization and will be strictly a dealers' proposition. It has already closed a deal with the Cleveland Rubber Corp. by which the latter will make special fibre and cord tires for it, starting production Oct. 10. The temporary officers are Frank R. Talbott, formerly treasurer and general manager of the Victor Rubber Co., president; J. W. Culley, vice-president; C. A. Crummel, treasurer; R. S. Lucas, secretary. The directors, in addition, include Roger Houston, Dr. C. C. Craig and George A. Talbott.

## VICTOR RUBBER STRONG

SPRINGFIELD, OHIO, Sept. 27—President H. S. Berlin of the Victor Rubber Co. announced this afternoon that the company during the months of July and August earned a profit of \$62,030 and in addition set aside \$36,781 as a reserve for unanticipated contingencies. The company has doubled its sales agencies and is preparing for an extensive sales program in 1922. Berlin states that he expects 1922 to be the most profitable year in the history of the company.

Unemployment Needs  
Before Conference

## Mayor Couzens of Detroit Is Expected to Act as Spokesman of Industry

WASHINGTON, Sept. 28—While no specific proposals regarding unemployment in the automotive industry have been submitted to the Unemployment Conference, it is expected that the subject will come up later in the discussions when the broad principles of the meeting are formulated. Of interest to the industry is the salutary effect the conference has exercised on legislative programs of Congress.

Simultaneously with the recommendation of the committee on public works of the conference, for Federal, State and municipal co-operation in road building and other public activity, it was announced that the House would make it a point to dispose of the pending highway bill immediately on convening next week. The National Automobile Chamber of Commerce and other automobile organizations have endeavored to show the conference the need of new highways and the effect their construction would have on employment conditions.
